PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

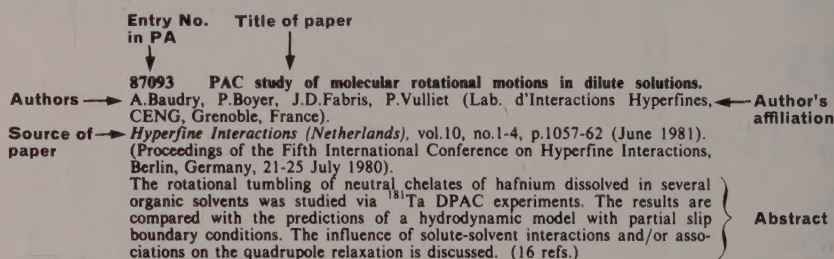

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

Physics Abstracts

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

| | Classification | | Classification | | Classification |
|--|------------------------------|--|---------------------------------|--------------------------------------|--------------------------|
| A mesons | 1440 | Atomic polarisability | 3510D | Boson systems | 0530 |

01.30C Conference proceedings

74198 Proceedings of the Hungarian-Austrian Health Physicists' Meeting. *Acta Phys. Acad. Sci. Hung. (Hungary)*, vol.52, no.3-4 (1982). [received: May 1983]

Conference held at: Győr, Hungary. Date 28 Sept.-1 Oct. 1981. The following topics were dealt with: dosimetry; environmental monitoring of radiation; radioactive pollution; medical effects of radiation exposure; radiation protection. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74199 Workshop on Science Underground.

AIP Conf. Proc. (USA), no.96 (1982). [received: May 1983]

Conference held at: Los Alamos, CA, USA. Date 1982. The following topics were dealt with: underground science laboratories, solar neutrinos, proton decay, cosmic rays and apparatus, geophysics, astronomy, solar models, gravity waves, and double beta decay. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74200 Proceedings of the Workshop on the Interaction Between Medium Energy Neutrons in Nuclei.

AIP Conf. Proc. (USA), no.97 (1982). [received: May 1983]

Conference held at: Bloomington, IN, USA. Date 28-30 Oct. 1982. Sponsors: NSF; DOE; Indiana Univ. The following topics were dealt with: nucleon-nucleon interaction; elastic scattering and optical model; NN interaction in nuclear reactions; macroscopic concepts; relativistic approaches; nucleus consists of more than nucleons, and experimental possibilities of the future. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74201 Conference on Particles and Fields - 1982.

AIP Conf. Proc. (USA), no.98 (1982). [received: May 1983]

Conference held at: College Park, MD, USA. Date 28-30 Oct. 1982. The following topics were dealt with: grand unified theories; proton decay; magnetic monopoles; supergravity; accelerator technology; electron-positron physics; QCD; two-photon physics; glueballs; quark jets; proton-antiproton interactions; massive lepton production; Upsilon spectroscopy; B mesons; muon-hadron interactions. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74202 Biomedical Engineering Society Symposia (papers in summary form only received).

Ann. Biomed. Eng. (USA), vol.11, no.1 (1983).

Conference held at: Chicago, IL, USA. Date 11-15 April 1983. The following topics were dealt with: bioengineering in exploration; recent advances in arterial wall research (physiology and bioengineering aspects); musculoskeletal mechanics; theoretical models of mass transport in the microcirculation; bioengineering aspects of noninvasive diagnosis of peripheral vascular disease; the interaction between the heart and vascular systems; mechanical behaviour of vascular smooth muscle; transport mechanisms of high frequency ventilation; single cell mechanics. 54 papers were presented.

74203 XX National Congress of the Italian Society for Nuclear Biology and Medicine held in association with the VI Annual Meeting of the Nuclear Medicine Section of the Italian Association for Radiology and Nuclear Medicine.

J. Nucl. Med. & Allied Sci. (Italy), vol.27, no.2 (April-June 1983).

Conference held at: Porto Cervo, Italy. Date 4-7 May 1983. The topics dealt with included: a double head rotating SPECT system; an electronic window for a gamma camera with variable zoom and centering; haemodynamic patterns in cirrhosis of the liver; a computer-assisted method for dactyoscintigraphy; first pass radionuclide angiocardiology using a ^{195m}Au generator; contemporary surface measurements of ^{59}Fe and ^{51}Cr using a multichannel analyser; radiometabolic therapy with ^{32}P in bone metastases; liver scintigraphy with radiocolloids; automatic analysis of scintigraphic dynamic series. 148 papers were presented, all of which are published in the present proceedings.

74204 Proceedings of the Topical Meeting of the COSPAR Interdisciplinary Scientific Commission A (Meetings A1 and A2) of the COSPAR Twenty-Fourth Plenary Meeting.

Adv. Space Res. (GB), vol.2, no.5 (1982). [received: April 1983]

Conference held at: Ottawa, Canada. Date 16 May-2 June 1982. The following topics were dealt with: the role of aerosols in climate, instrumentation and future measurement systems, retrieval procedures, measurements and observations, ground truth measurements, effects on remote sensing and on climate, and ozone variability in the middle atmosphere.

74205 NATO ASI on Atomic and Molecular Processes in Controlled Thermonuclear Fusion, Palermo, July 19-30, 1982. C.J. Joachain (Univ. Libre de Brussels, Brussels, Belgium), D.E. Post.

Comments At. & Mol. Phys. (GB), vol.13, no.2, p.85-94 (1983).

Atomic and molecular processes are proving to be key issues in the operation of controlled thermonuclear fusion experiments. The Comment reports on a recent NATO Advanced Study Institute conference devoted to this subject. (1 ref.)

74206 Collision topics at ESCAMP VI. J.B. Hasted (Birkbeck Coll., Univ. of London, London, England).

Comments At. & Mol. Phys. (GB), vol.13, no.2, p.95-101 (1983).

Plasma processes in fusion, in interstellar media, in ion sources, in hollow cathode discharges, in gas laser pumping, in laser breakdown of gases and in cryogenic systems were among the topics discussed at the sixth European Sectional Conference on Atomic and Molecular Processes in Ionized Gases, held in Oxford, September 1-3 1982. (12 refs.)

74207 Advanced Laser Technology and Applications.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335 (1982). [received: May 1983]

Conference held at: Arlington, VA, USA. Date 6-7 May 1982. The following topics were dealt with: laser performance of Nd:YLF; spectroscopic properties of TbP_2O_7 , $\text{TbLi}_2\text{P}_2\text{O}_7$ and $\text{TbAl}_2(\text{BO}_3)_4$; theoretical calculations of fluorescent branching ratios for $\text{YAlO}_3:\text{Er}^{3+}$ from the complete Judd-Ofelt theory; recent advances in coaxial flashlamp-pumped high energy dye lasers; wavelength selectivity with metal halide lasers; objective laser speckle method for 3-D displacement measurement on curved surfaces; frequency stabilisation of CO_2 lasers; 1 to 2 μm III-V compound detectors; miniature short-pulse Nd:YAG laser oscillator; 1.73 μm eyesafe laser rangefinder; unique applications of alexandrite lasers; CO_2 laser radar transmitters; progress in slab geometry solid state lasers and nuclear pumped $\text{O}_2(^1\Delta)-\text{I}_2$ lasers. 17 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74208 Fiber Optics: Short-Haul and Long-Haul Measurements and Applications.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.355 (1982). [received: May 1983]

Conference held at: San Diego, CA, USA. Date 24-25 Aug. 1982. The conference included papers on the important subjects of short-haul systems and measurements. Attention was also given to the more popular subjects of long-haul systems and applications. Session 1 represents a potpourri of fiber optics: the papers address some of the more pressing topics of 1982. The work discussed is generally at the research level, in contrast to the more applications-oriented subjects on the other three sessions. The second session, on terminal devices, concentrates on those devices that allow full exploitation of the fiber capability. The third session addressed the subject of test and measurement and includes papers on component testing as well as system evaluation. The problems encountered in short-haul applications of fiber optics are unusual. Military applications of fibers, for example, are frequently over short distances. The problems, nevertheless, are severe. The last session addresses many of these short-haul problems.

74209 Proceedings of the Fourth International Workshop on Biomagnetism.

Nuovo Cimento D (Italy), vol.2D, ser.1, no.2 (March-April 1983).

Conference held at: Rome, Italy. Date 14-16 Sept. 1982. The following topics were dealt with: instrumentation; cardiomagnetism; neuromagnetism; bio susceptibility; magnetoplethysmography; other fields of the body. A brief appendix is given on the multiple expansion of a biomagnetic field. 46 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74210 2nd Annual Meeting of the Canadian Radiation Protection Association (papers in summary form only received).

Health Phys. (GB), vol.44, no.4 (April 1983).

Conference held at: Ottawa, Canada. Date 5-6 May 1981. The topics dealt with included: risk estimates for the induction of cancer due to low doses of low-LET radiation; potential health impacts of enhanced radiation levels in Port Hope, Ontario. UV radiation and suntanning; long term retention of a class Y uranium thorax burden; modification of a shadow shield whole body monitor for measurements of uranium lung burdens; internal dosimetry; evacuation during reactor incidents; dosimetric consideration of radioactive particle inhalation. 28 papers were presented.

74211 Saturn Conference.

Icarus (USA), vol.53, no.2 (Feb. 1983).

Conference held at: Tucson, AZ, USA. Date 11-15 May 1982. The following topics were dealt with: Saturn; A-ring; B-ring; ring bending waves; ring particles shepherding; spokes; micron-size particles; albedo; heat flux; energy balance; methane; Hyperion; Iapetus; Phoebe; Titan; NH_3 ice and clouds.

74212 Symposium on the Rise in Atmospheric Carbon Dioxide.

J. Geophys. Res. (USA), vol.88, no.C2 (20 Feb. 1983).

Conference held at: Bern, Switzerland. Date 14-18 Sept. 1981. Various aspects of the atmospheric carbon cycle were studied. In particular atmospheric chemistry changes due to industrial CO_2 release were studied. Several of the papers report actual CO_2 concentration observations recorded at various localities around the world.

74213 International Meeting on Lithium Batteries.

J. Power Sources (Switzerland), vol.9, no.3-4 (April-May 1983).

Conference held at: Rome, Italy. Date 27-29 April 1982. The following topics were dealt with: secondary cells, primary cells, Li-Al electrodes, electrolytes, diffusion in solids, corrosion, electrochemical electrodes, cathodes, anodes, electrochemistry, Li/SOCl_2 battery, Raman spectroscopy, liquid structure, Li/SO_2 cells, passivation, organic compounds, intercalation compounds, X-ray diffraction examination, cation glasses, NMR spectra, superionic conducting materials, viscoelasticity, scanning electron microscopy and viscosity of liquids. 25 papers were presented, of which all are published in full in the present proceedings.

74214 Bendor Free Electron Laser Conference.

J. Phys. Colloq. (France), vol.44, no.C-1 (Feb. 1983).

Conference held at: Bendor, France. Date 26 Sept.-1 Oct. 1982. Sponsors: CNRS; CENS; et al. The following topics were dealt with: preliminary results of the Adone storage ring FEL experiment; pulse propagation in free-electron lasers; status of the MSNW tapered-wiggler FEL experiment; high-efficiency free-electron laser results; the Brookhaven free-electron laser experiment; FEL quantum aspects; delay effect in laser amplifiers; free-electron laser oscillator

startup analysis; simulation of isochronous storage ring free-electron laser; helical undulator study; application of transverse gradient wigglers in high efficiency storage ring FELs; the UK free-electron laser; Linac technology for free-electron lasers; storage ring design optimisation for FEL operation; permanent magnet undulators; microtrons for free-electron lasers; tapered wigglers; optical klystrons; review of recent experimental results from the Stanford 3 μ m free-electron laser; the LELA undulator main features and performance; fully quantised many particle theory of a free-electron laser; one-dimensional numerical simulation of a free-electron laser-storage ring system; optical instabilities and coherence in the free-electron-laser; resonator cavity design for two-stage FEL experiment; far infrared free-electron laser; Cerenkov lasers and transverse mode structure of a tapered-wiggler FLE oscillator. 43 papers were presented, of which 32 are published in full in the present proceedings, and 11 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74215 International Workshop on Optical Phase Conjugation and Instabilities.

J. Phys. Colloq. (France), vol.44, no.C-2 (March 1983).

Conference held at: Cargèse, Corsica, France. Date: 20-24 Sept. 1982. Sponsors: CNRS. The following topics were dealt with: nonlinear propagation in degenerate four wave mixing; optical gratings; transients; pulse compression; spectroscopy and diagnostics; nonlinear polarisation and materials in degenerate four wave processes; strong optical excitations and nonlinearities; optical instabilities and chaos. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74216 International Symposium on Theoretical Organic Chemistry.

Pure & Appl. Chem. (GB), vol.55, no.2 (Feb. 1983).

Conference held at: Dubrovnik, Croatia, Yugoslavia. Date: 30 Aug.-3 Sept. 1982. The following topics were dealt with: present-day problems in theoretical organic chemistry and their influence on preparative organic chemistry. 29 papers are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74217 Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys.

Physica B & C (Netherlands), vol.119 B+C, no.1-2 (April 1983).

Conference held at: Nagoya, Japan. Date: 15-16 Sept. 1982. The following topics were dealt with: theory; phase transition; thermal expansion and Invar alloys; elastic constants; pressure dependence; magnetostriction; amorphous alloys. 33 papers are published in full in the present proceedings, and 4 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74218 VDE-Kongress '82 (VDE-Congress '82).

VDE Fachber. (Germany), vol.34 (1982).

Conference held at: Düsseldorf, Germany. Date: 4-6 Oct. 1982. The following topics were dealt with: electrical engineer's training, fibre optics engineering, optical fibres, telemetry, thermal power stations, solar power stations, nuclear power stations, water power reserves, power transmission and distribution, digital protection, HV switchgear, short-circuit currents, cable terminations, electric connectors, data networks, videodata, data communication systems, PCM, optical fibre cable systems, amorphous metals, electronic displays, radio paging, mobile radio systems and voice communication. 12 papers were presented, of which all are published in full in the present proceedings.

74219 Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982.

New York, USA: IEEE (1982), 1484 pp.

Conference held at: San Diego, CA, USA. Date: 27-30 Sept. 1982. The following topics were dealt with: space solar arrays, welded solar cell interconnection, silicon sheet materials, crystallisation techniques, directional solidification, crystal growth, non-destructive testing. Si solar cells, thin film cells, photovoltaic pumping systems, power supplies to apparatus, space vehicle power plants, III-V semiconductors, solar power stations, space radiation effects, high efficiency Si solar cells, polycrystalline Si impurities, grain boundaries, defect analysis, solar energy concentrators, CdS/Cu₂S solar cells, concentrating solar cells, CdS-based solar cells, terrestrial systems and economics, amorphous semiconductors, MIS/SIS solar cells, reliability testing and field experience and alternative solar cell materials. 278 papers were presented, of which 279 are published in full in the present proceedings, and 9 as abstracts only.

74220 Topical Meeting on Meteorological Optics. Technical Digest.

Washington, DC, USA: Opt. Soc. America (1983), 80 pp.

Conference held at: Incline Village, NV, USA. Date: 12-14 Jan. 1983. Sponsors: Opt. Soc. America; Air Force Office Sci. Res. The following topics were dealt with: green flash, red sunset, blue sky, snow colour, light scattering, droplet sizes, lunar corona, aerosols, rainbows, halos, polarised light, Ezekiel's wheels, singularities, light pillars, phase functions, mirages and air quality.

74221 Topical Meeting on Optical Techniques for Remote Probing of the Atmosphere. Technical Digest.

Washington, DC, USA: Opt. Soc. America (1983), 332 pp.

Conference held at: Incline Village, NV, USA. Date: 10-12 Jan. 1983. Sponsors: Opt. Soc. America; Air Force Office Sci. Res. The following topics were dealt with: optical radiation prospecting, laser remote sensing, aerosol, cloud, backscatter, Raman scattering, upper atmosphere wind, precipitation, atmosphere composition, chemical reaction, moisture, temperature, weather indicator, lidar system, radiometer, troposphere, spectrometer, interferometer, snow, Earthlimb emission, radiance, speckle phenomena, CO, NO, extinction coefficient, smoke, scintillation, evaporation, pressure, water content, optical pulses, densities, O₃, airflow, turbulence and stratosphere.

74222 Fourth International Ocean Disposal Symposium.

Plymouth, Devon, England: Plymouth Polytechnic (1983), ii+181 pp.

Conference held at: Plymouth, Devon, England. Date: 11-15 April 1983. The objective of this symposium is to provide a forum for the exchange of ideas and information among investigators involved in ocean disposal research; to enhance the scientific consideration of waste disposal in the marine environment with the production of a symposium volume; and to generate recommendations and guidelines for future studies on ocean disposal practices. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74223 Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028).

Oak Ridge, TN, USA: Oak Ridge Nat. Lab (1982), ix+455 pp.

Conference held at: Washington, DC, USA. Date: 29-30 Sept. 1982. Sponsors: Office Nucl. Mater. Safety & Safeguards; U.S. Nucl. Regul. Comm.; Oak Ridge Nat. Lab. The following topics were dealt with: low level radioactive waste; radwaste disposal; waste facility design; operating practices; trench design; land disposal; health physics monitoring; environment protection; 24 papers were presented, all of which are published in full in the present proceedings.

74224 Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium.

Knoxville, TN, USA: Univ. Knoxville (1983), 2 vol. vi+762 pp.

Conference held at: Knoxville, TN, USA. Date: 21-23 March 1983. Sponsors: Univ. Tennessee; IEEE; EPRI; et al. The following topics were dealt with: modeling and simulation of power systems; nuclear power system components; modeling and control of nonnuclear power systems; human factors and operator aids; power plant surveillance and diagnostics. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74225 Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received).

Stoughton, WI, USA: Synchrotron Radiat. Center (1982), 80 pp.

Conference held at: Stoughton, WI, USA. Date: 18-19 Oct. 1982. The following topics were dealt with: applications of synchrotron radiation in photoemission and bandstructure determinations and synchrotron radiation sources. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74226 Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds.

Bristol, England: IOP (1983), xvi+650 pp. [0 85498 156 X]

Conference held at: Albuquerque, NM, USA. Date: 19-22 Sept. 1982. Sponsors: Air Force Office Sci. Res. The volume contains eighty-five selected papers from those presented at the conference. The technical program of the conference included sessions on bulk and epitaxial crystal growth, optoelectronic devices, microwave devices, ion implantation, and characterization, and the chapters of this volume reflect these areas. Improvements in the preparation of high purity undoped semi-insulating GaAs were reported, along with considerable discussion of the EL2 electron trap in this material. Advances in bulk InP growth and the growth of bulk III-V alloys were presented. Research on GaAs, InP, and alloy high frequency and optoelectronic devices demonstrated increasingly sophisticated structures, including modulation-doped heterostructure charge-coupled devices. Readers will also detect greater sophistication in the techniques being used for characterizing defects, deep levels, and residual impurities in GaAs, InP and related alloys. The papers included reflect the current status of research in GaAs and related compound materials and devices. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

74227 Cloud Dynamics. Proceedings of a Symposium held at the Third General Assembly of IAMAP.

Dordrecht, Netherlands: Reidel (1982), vii+423 pp. [90 277 1458 4]

Conference held at: Hamburg, Germany. Date: 17-28 Aug. 1981. The following topics were dealt with: observation and models of shallow convective systems, and deep convective systems; the cloud phenomena considered range from cumulus and cloud streets to organised mesoscale cellular convection. Winter lake induced snow squalls, thunderstorms, hailstorms and tornadoes are discussed. Doppler radar observations and thunderstorm model results are discussed.

74228 Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference.

New York, USA: Plenum (1983), x+432 pp. [0 306 40996 8]

Conference held at: Stockholm, Sweden. Date: 2-4 June 1982. The field of particle physics is developing very rapidly. During this past year, physicists added a new instrument to their arsenal for the study of quark-quark, quark-lepton, and lepton-lepton interactions. This machine, the PROTON-ANTI-PROTON COLLIDER, achieved the highest energy in the world. With its five detectors, it is beginning to explore hitherto inaccessible regions for new physics. Lepton-lepton machines with detectors at full efficiency are producing copious data of the very highest precision. The possibility of glueballs and the detailing of the properties of the upilon family have been of major importance this year. The particle jets which are believed to be direct manifestations of the quark structure of matter continue to provide valuable data against which we can test the ideas of QCD. With the advent of more and better data it is now possible to study in detail the formation evolution of hadronic states. Especially interesting are the properties of heavy quark states. A far-seeing look into the future development of any fecund scientific field is rarely accurate, but is always stimulating.

74229 The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics.

New York, USA: Plenum (1983), xi+1104 pp. [0 306 41036 2]

Conference held at: Erice, Italy. Date: 31 July-11 Aug. 1980. The following topics were dealt with: induced gravitation; gauge theories; unification; Lie algebras; electroweak physics; conservation laws; quark masses; high energy interactions; QCD; charmed particles; deep inelastic phenomena; QED; e⁺e⁻ physics. 26 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

01.30E Monographs, and collections

74230 Magnetospheric plasma physics. A.Nishida [Ed.]

Dordrecht, Netherlands: Reidel (1982), xii+348 pp. [90 277 1345 6]

One of the six principal courses of the Autumn College of Plasma Physics, International Center for Theoretical Physics, Trieste, Italy, October 16-November 23, 1979, was devoted to space plasma physics. This monograph contains review articles drawn from the five lecture series comprising the space plasma physics course given on that occasion. The first, introductory chapter deals with the origin of the plasma that fills planetary magnetospheres. The means by which solar wind energy and momentum are communicated to the magnetosphere is discussed in the second chapter. The third chapter discusses a basic instability of magnetospheric tails that converts stored magnetic energy into flow kinetic energy and into accelerated particles. The fourth chapter presents results of advanced numerical simulation of auroral acceleration processes. The fifth chapter reviews the observations and theory of the electrostatic electron cyclotron harmonic waves responsible for the diffuse aurora.

74231 International advances in nondestructive testing. Vol.9. W.J.McGonagle [Ed.]

New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The following topics were dealt with: light propagation in optical fibres; acoustical speckle interferometry; laser speckle interferometry; magnetic flux leakage inspection of wire rope; holographic nondestructive testing; Seebek effect in nondestructive evaluation of metals; electrostatic charge decay technique; digital nondestructive evaluation of composite materials; multi-directional eddy current coils; microencapsulated penetrant inspection.

- 74232 Annual review of nuclear and particle science. Vol.32.** J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.]
Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]
The book reviews developments in the following fields: beam foil and statistical spectroscopy; giant resonances; short lived nuclide identification; composite system interactions; QCD: particle electric-dipole moments; γ -ray astronomy; nuclear resonances; particle calorimetry; inertial confinement fusion; intermediate vector bosons; charged current neutrino interactions.
- 74233 Physico-Chemical Behaviour of Atmospheric Pollutants. Proceedings of the Second European Conference.**
Dordrecht, Netherlands: Reidel (1982), xvi+672 pp. [90 277 1349 9]
Conference held at: Varese, Italy. Date 29 Sept.-1 Oct. 1981. The following topics were dealt with: identification and analysis of pollutants, chemical and photochemical reactions, aerosols, pollutant cycles, and transport and modelling field experiments.

01.30M Textbooks for graduates and researchers

- 74234 Annual review of fluid mechanics. Vol.15.** M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.]
Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]
The book, the annual review of fluid mechanics, contains 18 chapters and covers: Ernst Mach's contribution to fluid mechanism; fluid mechanics of green plants; snow avalanches; wind turbine; compressible liquid impact; autorotation; wave breaking; flames; turbulence; airfoils; two-phase flow; non-Newtonian fluid mechanics; magneto-atmospheric waves; Langmuir circulation; jets; pipe flow and freezing-melting interfaces.
- 74235 Microcomputer quantum mechanics.** J.P.Killingbeck.
Bristol, England: Adam Hilger (1983), x+177 pp. [0 85274 455 2]
Much of the book is about the wise use of microcomputers in scientific work, and so should be of interest to a wide group of students and research workers. The book has 12 chapters dealing with the following subjects: microcomputers and BASIC; tuning the instrument; iterative approach; finite-difference methods; numerical integration; Padé approximants; simple power series method; matrix calculation; hypervirial-perturbation methods; finite difference eigenvalue calculations; and one-dimensional model problems. Some case studies of quantum mechanics problems are given in the last chapter.
- 74236 Circulation in the coastal ocean.** G.T.Csanady.
Dordrecht, Netherlands: Reidel (1982), xi+279 pp. [90 277 1400 2]
The following topics were dealt with: fundamental equations and their simplification, inertial response to wind, the behaviour of the stratified sea, the subtle effects of topography, transient coastal currents, flow controlled by bottom friction, thermohaline circulation, and observed quasi-steady flow patterns in shallow seas.
- 74237 Gauge theory of dislocations and disclinations.** A.Kadic, D.G.B.Edelen.
Berlin, Germany: Springer-Verlag (1983), vii+290 pp. [3 540 11977 9]
Noting that the group $SO(3) \rightarrow T(3)$ may be viewed as a 6-parameter gauge group that leaves the Lagrangian of elasticity theory invariant, the Yang-Mills universal gauge theory construction is used to erect a complete continuum theory of material bodies with dislocation and disclination fields. Breaking of the homogeneity of the action of $SO(3)$ is shown to give rise to disclinations and rotational dislocations while homogeneity breaking of $T(3)$ gives rise to translational dislocations. A rigorous justification for replacing displacement gradients by the components of the distortion tensor and Newtonian kinematic velocity by distortional velocity is obtained. A complete analysis of the theory is made and an expansion in terms of a group scaling parameter is obtained. It is shown that in the first order approximation classical elasticity theory is recovered, while the second and third orders of approximation model theories of dislocations and disclinations, respectively. (45 refs.)

01.30P Textbooks for undergraduates

- 74238 Foundations of theoretical mechanics. II. Birkhoffian generalization of Hamiltonian mechanics.** R.M.Santilli.
Berlin, Germany: Springer-Verlag (1983), xix+370 pp. [3 540 09482 2]
The author of this volume shows that all sufficiently regular Newtonian systems, whether conservative or not, can be treated via conventional variational principles, Lie algebra techniques and methods from symplectic geometry. Contrary to the simpler systems usually described in textbooks on classical mechanics, these lead to a generalization of the usual Hamiltonian equations of analytic mechanics; the author calls them Birkhoffian. The author shows for the first time the most general and complete answer to the inverse problem, deals with the transformation theory, and gives numerous applications in physics, chemistry and engineering. The book was written not only for students of mechanics, but also for those who wish to apply the principles of mechanics to realistic and therefore typically nonconservative systems. (175 refs.)

01.50 EDUCATIONAL AIDS

- 74240 Proposal for a national underground science facility. A.K.Mann (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA). *AIP Conf. Proc. (USA)*, no.96, p.16-36 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982). The idea is explored of establishing a laboratory complex shielded from the cosmic ray flux at the Earth's surface for the purpose of housing and providing technical support for experiments in particle physics, astrophysics, and other scientific disciplines. The scientific motivation for such an underground science facility is described, and the questions of location and desired properties of the facility are discussed. (9 refs.)
- 74241 Perspectives of fundamental research in the Gran Sasso Underground Laboratory. M.Conversi (Dept. of Phys., Univ. of Rome, Rome, Italy). *AIP Conf. Proc. (USA)*, no.96, p.37-51 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982). The installation of very massive and sophisticated particle detectors deep underground will provide a new way to attack frontier problems of subnuclear physics, astrophysics and cosmology. The author considers existing and future laboratories. (31 refs.)
- 74242 The Gran Sasso project. A.Zichichi (INFN, Rome, Italy). *AIP Conf. Proc. (USA)*, no.96, p.52-64 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982). The author presents the final solution adopted for the 'Gran Sasso' Underground Laboratory. (1 ref.)
- 74243 Particle physics below the Earth's surface, an overview of possibilities. J.G.Learned (Univ. of Hawaii, Manoa, Honolulu, HI, USA). *AIP Conf. Proc. (USA)*, no.96, p.236-47 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982). Potential subterranean cosmic ray and high energy particle physics experiments of current interest are reviewed. It is argued that most of the experiments may be attempted with instruments that fall generally into two classes: 1) detectors with greater than one thousand ton mass and MeV energy sensitivity, and 2) those with far greater mass, megatons or more, but much higher energy threshold, TeV. Those in class 1 are useful for nucleon decay searches, solar neutrino observations, and monitoring for supernovae in the Galaxy. Class 2 detectors are aimed at high energy neutrino astronomy and various cosmic ray muon studies and the nature of interactions at ultra high energies. Both types can do useful muon studies, depending particularly upon depth. Finally the prospects for second generation nucleon decay searches are discussed and it is concluded that a national underground laboratory may be justified sometime in the future, after the results of contemporary endeavors are available, but that at present it is not possible to define the characteristics required of such a national facility. However, it is suggested that studies be undertaken to evaluate the various options, including novel technology, such as TPC-like devices, and to evaluate location options, such as being near a surface cosmic ray installation, or being located in the ocean. (12 refs.)
- 74244 Microcomputer measurement of the velocity of sound in air. P.A.Bates (Div. of Phys. & Astron., Preston Polytech., Preston, England). *Phys. Educ. (GB)*, vol.18, no.3, p.128-33 (May 1983). The velocity of sound in air can be measured in a general physics laboratory using many well known methods such as Hebb's method, Kundt's tube, etc. The experiment described allows the velocity of sound in air to be determined relatively easily but it has really been developed to enable a student to use a microcomputer in a physical experiment. The intention has been for the student to become familiar with an Apple II microcomputer that is being used for data collection and to realise that data collected in this manner may be processed manually as well as with the aid of a computer. It is hoped that by using such techniques students may be instructed in the best use of computers in both the collection and handling of experimental results. (1 ref.)

01.60 BIOGRAPHICAL, HISTORICAL, AND PERSONAL NOTES

- 74245 Analysis of dust rain in the historic times of China. Zhang De'er (Chinese Acad. of Meteorological Sci., State Bur. of Meteorology, Beijing, China). *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol.28, no.3, p.361-6 (March 1983). The author has extracted 1156 historical writings of dust rain from local histories and history books written in biographical style. In this paper, some characteristics of dust rain and their climatic background are discussed. (5 refs.)
- 74246 Hauksbee's prototypical electrostatic generator. J.E.Senior. *Med. Instrum. (USA)*, vol.17, no.2, p.126-7 (March-April 1983). An event occurred in 1675 that proved to be of no little consequence in the history of electricity. The French astronomer Jean Picard observed a curious glow in the vacuum atop an oscillating column of mercury in a barometer. His observation set into motion a series of steps that 30 years later culminated in the construction of the prototype of the electrostatic generator by Francis Hauksbee (ca 1666-1713). The four essential components of the electrostatic generator—the rotating electric, cushion, collector, and prime conductor—were not to be incorporated into the design until the mid 18th century, but the device that the English scientific virtuoso designed to demonstrate the glow or 'mercurial phosphorus' of the barometer before members of the Royal Society of London was the 'phantom horse always runs before our modern locomotives', as Wells put it. (no refs.)
- 74247 Contributions of Ernst Mach to fluid mechanics. H.Reichenbach (Ernst-Mach-Inst., Freiburg, Germany). In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.1-28. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1] The author describes the contributions of Ernst Mach to experimental physics, especially to gas dynamics and ballistics, and thus not only explains the Institute's name but also serves a great physicist's reputation for noteworthy discoveries in natural science. (31 refs.)

01.65 HISTORY OF SCIENCE

- 74248 Correlation analysis in organic chemistry: retrospect. N.B.Chapman (Dept. of Chem., Univ. of Hull, Hull, England). *Indian J. Phys. Part B*, vol.56B, no.6, p.1-8 (Dec. 1982). [received: May 1983] The author traces the history of the subject, starting with Brønsted and Pedersen's famous paper of 1924. The treatment will have autobiographical and quasi-philosophic notes in it. It will highlight historically significant events: the publication in 1940 of the first edition of L.P. Hammett's *Physical Organic Chemistry*, the Faraday Society Discussion on Mechanism and Kinetics of organic reactions in liquid systems, 1941, H.H. Jaffe's chemical review, 1953, R.W. Taft's Chapter in Steric Effects in Organic Chemistry, ed. M.S. Newman, 1956, among others. The development of (a) the realisation of the importance of statistical methodology (and probity), (b) the separation of polar and steric effects, (c) the use of multiparameter equations, (d) extensions into biomedical chemical topics will be outlined. (15 refs.)
- 74249 The prediction and discovery of conical refraction by William Rowan Hamilton and Humphrey Lloyd (1832-1833). J.G.O'Hara (Historisches Inst., Univ. Stuttgart, Stuttgart, Germany). *Proc. R. Ir. Acad. Sect. A (Ireland)*, vol.82A, no.2, p.231-57 (Dec. 1982). [received: May 1983] The discovery of conical refraction in biaxial crystals by Humphrey Lloyd followed a brilliant mathematical prediction by William Rowan Hamilton, which was first announced at the Royal Irish Academy in October 1832. The importance of the discovery was entirely theoretical; it represented the completion of the theory of double refraction published by Huygens in 1690. Fresnel, who developed the received theory of double refraction in biaxial crystals, had inadequately described the form and properties of the wave surface which bears his name. Hamilton discovered four conoidal cusps on the wave surface, from which he predicted the phenomena of external and internal conical refraction. The discovery was a triumph for the view and methodology of optics presented by Hamilton in a series of memoirs on the 'Theory of systems of rays'. Hamilton's correspondence at the end of 1832 and in early 1833 reveals that the discovery was made possible by close collaboration with the experimentalist Lloyd. (23 refs.)

02.00 MATHEMATICAL METHODS IN PHYSICS

02.10 ALGEBRA, SET THEORY, AND GRAPH THEORY

- 74250 Modular Jordan algebras of self-adjoint operators. Sh.A.Ayupov (Inst. of Math., Acad. of Sci., Tashkent, Uzbek SSR). *Theor. & Math. Phys. (USA)*, vol.53, no.1, p.994-7 (Oct. 1982). Translation of: *Theor. & Math. Fiz. (USSR)*, vol.53, no.1, p.77-82 (Oct. 1982). An investigation is made into the connection between the type of a JW algebra (i.e. a weakly closed Jordan algebra of self-adjoint operators on a Hilbert space) and the type of the enveloping von Neumann algebra. It is shown that every finite trace (faithful or normal) on a JW algebra A can be extended to a finite trace (faithful or normal, respectively) on the enveloping von Neumann algebra $u(A)$. Using this result, it is shown that the JW algebra A is modular if and only if $u(A)$ is a finite von Neumann algebra. If A is a reversible JW factor, then it has the type II₁; if and only if $u(A)$ has the type II₁. (12 refs.)

- 74251 Maximal symmetry in Banach spaces. G.V.Wood (Dept. of Maths., Univ. Coll., Swansea, Wales). *Proc. R. Ir. Acad. Sect. A (Ireland)*, vol.82A, no.2, p.176-86 (Dec. 1982). [received: May 1983]
- A Banach space X is convex-transitive if the orbit of any point on the unit sphere under the group of isometries has its convex hull dense in the unit ball. This implies that X is maximal i.e. no equivalent norm has a strictly larger group of isometries. The author characterizes real and complex $C_0(S)$ -spaces that are convex-transitive, and shows that there is a locally compact Hausdorff space S with no non-trivial homeomorphisms but with the complex space $S_0(S)$ maximal. 02.30 FUNCTION THEORY, ANALYSIS

- 74252 Nonlinear boundary problem of a high order homogeneous elliptical equation. Huang Si-xun. *Fudan J. (China)*, vol.21, no.4, p.379-90 (Dec. 1982). In Chinese. [received: June 1983]
- Discusses the nonlinear boundary problem (A) of a high order homogeneous elliptical equation (E_0). First of all the author expresses the regular-solution $U(x,y)$ of equation (E_0) as the form of vector and then reduces the problem (A) to nonlinear general Riemann-Hilbert Poincaré problem. Finally the author uses the expression of a high order derivative of the homomorphic function which is analogous to Bekya's (1964) and considers the nonlinear general R-H-P problem as nonlinear Fredholm integral equations. When λ is sufficiently small and the linear Fredholm equations are solvable, by the help of Schauder's Fix-point theorem, the existence of the solution of problem (A) is proved. (5 refs.)
- 74253 On some linear integral equations generating solutions of nonlinear partial differential equations. F.W.Nijhoff, G.R.W. Quispel, J.van der Linden, H.W.Capel (Inst.-Lorentz voor Theoretische Natuurkunde, Leiden, Netherlands). *Physica A (Netherlands)*, vol.119A, no.1-2, p.101-42 (April 1983).
- Two types of linear inhomogeneous integral equations, which yield solutions of a broad class of nonlinear evolution equations, are investigated. One type is characterized by a two-fold integration with an arbitrary measure and contour over a complex variable k , and their complex conjugates, whereas the other one has a two-fold integration over one and the same contour. For special elements of the matrices closed partial differential equations can be derived, such as e.g. the nonlinear Schrödinger equation and the (real and complex) modified Korteweg-de Vries and sine-Gordon equations. The relations between the matrix elements are shown to lead to Miura transformations between the various partial differential equations. (32 refs.)

03.00 CLASSICAL AND QUANTUM PHYSICS; MECHANICS AND FIELDS

03.20 CLASSICAL MECHANICS OF DISCRETE SYSTEMS: GENERAL MATHEMATICAL ASPECTS

(for applied classical mechanics of discrete systems, see 46.10; for celestial mechanics, see 95.10)

- 74255** Quaternion transformation and its application to the displacement analysis of spatial mechanisms. W.Qingui (Peking Aeronaut. Inst., Peking, China). *Acta Mech. Sin. (China)*, no.1, p.54-61 (1983). In Chinese.
The quaternion component matrix is introduced first; it is shown that this matrix is a indication of the quaternion in a 4×4 matrix space. It is isomorphic to quaternion and this relation has been summarized into the Isomorphic Theorem 1. Secondly, a real number quaternion transformation is used to study the general motion of a rigid body and the relative motion of several rigid bodies; the attitude equations and the displacement equations in general motion of a rigid body in the form of the real number quaternions are derived. Lastly, the application of the derived formulae to the displacement analysis of spatial mechanisms is demonstrated. (9 refs.)
- 74256** Some classes of exact solutions of problems on the motions of two connected bodies. P.V.Kharlamov, M.Yu.Lesina. *Dopov. Akad. Nauk UkrSR, Ser. A (USSR)*, no.3, p.51-3 (1983). In Ukrainian.
A pair of rigid bodies with mass distribution the same as that of Lagrange gyroscopes are coupled by an ideal spherical hinge belonging to both symmetry axes. Such a system is a model for the so-called dual-spin satellite. The system is supposed to move in space without any external forces. Two classes of exact solutions are found for this problem. (8 refs.)
- 74257** Stability of gyro with harmonic nonlinearity in spinning vehicle. S.N.Singh (Dept. of Electrical Engng., Federal Univ. of Santa Catarina, Florianopolis, Brazil). *IEEE Trans. Aerosp. & Electron. Syst. (USA)*, vol.19, no.2, p.182-9 (March 1983).
A stability analysis of a single-axis rate gyroscope mounted in a space vehicle which is spinning with uncertain angular velocity ω_s about the spin axis of the gyro is presented. The complete nonlinear equation of motion, which includes the fundamental and second harmonic nonlinear terms, arising due to ω_s , is considered. For time-varying $\omega_s(t)$ using the circle criterion, it is shown that the gimbal motion is globally asymptotically stable if the Nyquist plot of the linear transfer function of the gyro lies in the interior of a certain disk. For the case of uncertain constant ω_s , using the Lyapunov approach, conditions for global asymptotic stability (GAS) and asymptotic stability are derived. Stable regions in parameter space of the gyro and state space are obtained. Analytical relations for the selection of gyro parameters are derived. (11 refs.)
- 74258** Supercritical behavior of an ordered trajectory. L.P.Kadanoff (James Franck Inst., Univ. of Chicago, Chicago, IL, USA). *J. Stat. Phys. (USA)*, vol.31, no.1, p.1-27 (April 1983).
The behavior of a particle undergoing a discrete, stepped motion around a circle is investigated for the case in which the average number of steps per revolution is the golden mean. The new features of this study are that the map in question is not invertible and that consequently the orbit is bunched into intervals within the circle. Because of this bunching, one can calculate the motion in some detail. (8 refs.)
- 74259** A delay induced bifurcation to oscillations. K.Gopalsamy (School of Maths., Flinders Univ., Bedford Park, Australia). *J. Math. & Phys. Sci. (India)*, vol.16, no.5, p.469-88 (Oct. 1982). [received: May 1983]
Hopf-bifurcation to oscillations in a time delayed logistic equation of the form $\dot{u}(t) = u(t)[a - \beta u(t) - \gamma u^2(t - \tau)]$ is considered with the delay τ as a bifurcation parameter. The stability of supercritically bifurcating periodic solutions and the instability of subcritically bifurcating solutions are established. (12 refs.)
- 74260** Inverse Feigenbaum bifurcations in Hamiltonian systems. G.Contopoulos (Dept. of Astron., Cornell Univ., Ithaca, NY, USA). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.4, p.149-55 (28 May 1983).
The author presents cases of Feigenbaum sequences of infinite bifurcations followed by inverse sequences in a Hamiltonian system representing a rotating

galaxy. It seems that the reversal of the Feigenbaum sequences is a general property of rotating dynamical systems. Then it is seen how such infinite sequences are generated. (8 refs.)

- 74261** Zones of possible motion in the Klebsh problem. The critical case. T.I.Pogossyan. *Mekh. Tverd. Tela (USSR)*, no.15, p.3-23 (1983). In Russian.
The author gives a topological and geometrical analysis of the problem of the motion of a solid body for the case of Klebsh integrability. The bifurcation of three first integrals is studied and two quadratics according to velocity are obtained. The author describes the regions swept out in the body by the directional vector of the symmetry axis of a strong field for all critical values of the constants of the given integrals. (3 refs.)
- 74262** Concerning the conditions for the existence of one class of polynomial solutions of the equation of motion of a solid body having a point of rest. G.V.Mozalevskaya. *Mekh. Tverd. Tela (USSR)*, no.15, p.24-31 (1983). In Russian.
The author considers the motion of a gyrost at having its centre of gravity on the first major axis of an ellipsoid of inertia constructed for the point of rest of the gyrost at. (7 refs.)
- 74263** One particular case of motion of a C.V. Kovalevski gyroscope. I.N.Gashchenko, V.N.Kasyanik. *Mekh. Tverd. Tela (USSR)*, no.15, p.31-4 (1983). In Russian.
The author constructs a full solution to the problem of motion of a Kovalevski gyroscope in the case of an equation of a zero-point constant 4th integral and of integrals of the moment of momentum. An algorithm due to M.P. Kharlamov (1981) is employed. The motion in this case is shown to have a common characteristic with the motion of the Steklov gyroscope. (6 refs.)
- 74264** Motion of an A.I. Dokshevich gyroscope. A.P.Kharlamov, D.N.Kravchuk. *Mekh. Tverd. Tela (USSR)*, no.15, p.35-9 (1983). In Russian.
The authors construct a full solution to the problem of the motion of an A.I. Dokshevich gyroscope (1970). An algorithm due to M.P. Kharlamov (1981) is used. The motion appears to be of a type previously associated with a D.N. Goryacheva. Angular velocity hodographs are obtained. (5 refs.)
- 74265** Concerning the motion of a gyrost at in the case of A.I. Dokshevich. E.K.Sergeev. *Mekh. Tverd. Tela (USSR)*, no.15, p.39-47 (1983). In Russian.
The author uses the method of hodographs to investigate the double-parametric series of exact solutions of the motion of a symmetrical heavy gyrost at in the case of integrability as shown by A.I. Dokshevich (1970). Various curves of motion are constructed in the plane of the parameters. A class of periodic motions is identified and for this class an M.P. Kharlamov algorithm (1981), is realised. (4 refs.)
- 74266** Concerning one particular class of gyrost at motion. M.P.Kharlamov. *Mekh. Tverd. Tela (USSR)*, no.15, p.47-56 (1983). In Russian.
The author considers the motion of a gyrost at in the case of L.N. Sretenski (1963) ($A=B=4C$, centre of mass in the equatorial plane and gyrostatic moment directed along the axis of dynamic symmetry). A double-parametric series of periodic solutions of the Euler-Poisson equation is obtained. The motion is investigated by the method of hodographs. (8 refs.)
- 74267** The motion of an E.I. Kharlamov gyroscope in the A.I. Dokshevich case. L.N.Oreshkina, A.P.Kharlamov. *Mekh. Tverd. Tela (USSR)*, no.15, p.57-61 (1983). In Russian.
The authors use the method of hodographs for the qualitative investigation of the motion of a body in the case of A.I. Dokshevich (1970) in the works of P.M. Burlak and G.V. Gorr (Mekhanika Tverdogo Tela: 1978, vol.10, p.3-10; 1974, vol.7, p.7-9). More rigorous results are obtained on the basis of the algorithm due to M.P. Kharlamov (Mekhanika Tverdogo Tela: 1981, vol.13, p.10-14) for the construction of a full solution by computer methods. (8 refs.)
- 74268** Two new solutions to the problem of motion of a heavy gyrost at. E.I.Kharlamova, G.V.Mozalevskaya. *Mekh. Tverd. Tela (USSR)*, no.15, p.61-75 (1983). In Russian.
The authors obtain two new solutions to an integro-differential equation associated with the motion of a heavy gyrost at. In the first solution the gyrostatic moment is directed along the axis passing through the centre of gravity, while in the second solution it is directed along the orthogonal axis. (4 refs.)
- 74269** Irreducible tensors and their application in problems of the motion of a solid body in strong fields. Yu.M.Urman. *Mekh. Tverd. Tela (USSR)*, no.15, p.75-87 (1983). In Russian.
The author introduces the concept of the irreducible tensor as a physical value which during the rotation of space is transformed according to an irreducible representation of the group of rotation. The algebra and characteristics of these tensors are discussed. It is shown how the mathematical apparatus of irreducible tensors can be applied to the mechanics of cosmic flight and the theory of contactless gyroscopes. (7 refs.)
- 74270** Symmetry in systems with gyroscopic forces. M.P.Kharlamov. *Mekh. Tverd. Tela (USSR)*, no.15, p.87-93 (1983). In Russian.
The author introduces the concept of the symmetry group in the mechanics of systems with gyroscopic forces. Conditions are found for the existence in these systems of a linear inhomogeneous integral analogous to the integral of moment in natural mechanical systems with symmetry. The author demonstrates a general theorem which does not assume a global Lagrangian. The motion of a solid body with a stationary point is investigated. The most general form of the potential and gyroscopic forces is examined. (4 refs.)
- 74271** Asymptotic uniform motions of a gyrost at. Yu.P.Varkhalev. *Mekh. Tverd. Tela (USSR)*, no.15, p.93-8 (1983). In Russian.
The author examines the asymptotic uniform motion of a gyrost at in a central Newtonian force field. It is shown that the equation of motion permits a solution in the form of exponential functions of time depending on two arbitrary constant and representative classes of asymptotic uniform motions tending toward unstable uniform rotation. (9 refs.)
- 74272** Towards the construction of periodic solutions of Hamiltonian systems. V.S.Elfinov. *Mekh. Tverd. Tela (USSR)*, no.15, p.98-101 (1983). In Russian.
The author examines the problem of Pункare (Nauka, 1971, vol.1, p.771) and presents an algorithm for constructing periodic solutions for Hamiltonian systems without rotation towards a variable action-angle. (4 refs.)

43.30 SPECIAL RELATIVITY

4273 Theory of physical similarity. P.S.Gulati, S.Gulati (Cuttington Univ. Coll., Monrovia, Liberia).

Indian J. Theor. Phys., vol.29, no.3, p.209-26 (Sept. 1981).

Over the years many scientists have unsuccessfully proposed alternative theories to overcome the logical inconsistencies of Einstein's theory of special relativity. The authors have created an entirely new theory—called the 'Theory of physical similarity, based upon three fundamental postulates, the 'Motion-dependent time-unit', the 'Invariant length-unit', and the 'Principle of physical similarity'. Light velocity in this theory turns out to be 'motion-dependent' and the absolute frame is identifiable as the frame in which light velocity from a stationary source attains the absolute maximum, say c_0 . Again, as the invariant Crompton wavelengths of all fundamental particles are definable in this theory, the postulated basic invariant 'length-unit', say l_0 , can be identified with the Crompton wavelength of any fundamental particle, say the electron. Then the absolute rest 'time-unit' may be taken as l_0/c_0 . Applying this theory to mechanics, electromagnetism and optics, it is established that it overcomes all the epistemological problems of Einstein's theory and circumvents the drawbacks of all other theories. (58 refs.)

4274 Tachyonium, an action-at-a-distance model. P.Stephans (Dept. of Phys., Eastern Oregon State Coll., La Grande, OR, USA).

Nuovo Cimento A (Italy), vol.75A, ser.2, no.1, p.1-16 (1 May 1983).

A model is presented for a tachyon and a bradyon bound in circular orbits. They are taken to be charged point particles interacting through action-at-a-distance retarded potentials without radiation reaction. The superluminal Lorentz transformations used conform to the relativity principle in that it retains the constancy of the speed of light, the forms of Maxwell's equations and the Lorentz force equation, and requires electric charges to retain their electric character upon transformation from superluminal to subluminal frames. Interactions between a tachyon and a bradyon are restricted to regions within two interaction cones. Backward cones are related to retarded potentials and forward cones to advanced potentials; this should be taken into account in resolving causal paradoxes. The tachyonium atom consisting of a tachyon-bradyon pair interacting through retarded potentials has discrete values of total energy and angular momentum for a given mass ratio; it is shown that this discreteness does not occur for half-retarded-half-advanced potentials. Values for conserved quantities and other properties are presented. A model that might explain many of the features of quasars is suggested. (31 refs.)

4275 Local equilibrium axion for density flows in relativistic thermodynamics. J.Gariel (Univ. de Madagascar, Antsirana, Madagascar).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.2, p.167-81 (11 April 1983). In French.

The author proposes a local-equilibrium axion for density flows in phenomenological relativistic thermodynamics of irreversible processes, so as to replace covariant form of the Gibbs relation suggested by Israel and Stewart (1979) which does not seem satisfactory. This axion enables one to find again the Eckart quasi-stationary state theory and fits in with the main results of the Israel-Stewart phenomenological theory for transient effects. The theory is limited to the typical case of a simple heat-conducting fluid. (16 refs.)

4276 The standard of length in the theory of relativity and Ehrenfest paradox. W.A.Rodrigues, Jr. (Inst. de Matematica, Estatística e Ciência da Computação, IMECC-UNICAMP, São Paulo, Brazil).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.2, p.199-211 (11 April 1983).

The author investigates the physical systems which can be associated with the standard clocks and standard rulers of the theory of relativity. It is shown that, once the standard clock has been identified, the standard ruler is uniquely determined as being a 'light ruler'. The author investigates under what conditions material rods can be used as standard rulers. This shows the existence of two distinct contractions in the theory that are often confused: the Einstein and the Lorentz contractions. It is argued that the Lorentz contraction is a real phenomenon which results as a consequence of the interaction of material bodies with the ground-state vacuum of the Universe. These results permit one to give a definitive answer to the question 'do metric standards contract?' and also to solve Ehrenfest's paradox (1909) in an almost trivial way. (32 refs.)

4277 The relativistic problem of two identical bodies with an attractive force of constant magnitude. N.S.Shavokhina (Joint Inst. of Nuclear Res., Dubna, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.605-6 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.852-6 (Aug. 1982). [received: May 1983]

The relativistic problem of two bodies attracting each other with a force constant in absolute magnitude can be represented as a boundary-value problem for a three-dimensional minimal surface in a pseudo-Euclidean space. In the case of identical bodies the problem simplifies greatly. (2 refs.)

On a three-body problem in relativistic quantum mechanics See Entry 74302

Localizability and coupling constants See Entry 74310

43.40 CLASSICAL MECHANICS OF CONTINUOUS MEDIA: GENERAL MATHEMATICAL ASPECTS

4278 The theorem of conservation of non-conservative field and the conservation laws for a certain class of continuum mechanics. Jin Fusheng (Changjiang River Shipping Sci. Res. Inst., Changjiang, China).

Acta Mech. Sin. (China), no.2, p.184-9 (1983). In Chinese.

The theorem of conservation of non-conservative fields has been derived using the differential variational principle, and the conservation laws of a certain class of continuum mechanics are given. (1 ref.)

Foundations of theoretical mechanics. II. Birkhoffian generalization of Hamiltonian mechanics See Entry 74238

43.40G Fluid dynamics: general mathematical aspects

(see also 47. Fluid dynamics)

4279 Improved difference methods for steady incompressible convective diffusion equations. Ye Jingtang (Fudan Univ., Shanghai, China).

Acta Mech. Sin. (China), no.2, p.111-18 (1983). In Chinese.

A group of difference schemes with self-adjusting ability is proposed; they can be utilized to solve steady incompressible convective diffusion problems. In the regions in which the local grid Reynolds number is small, the precisions of these schemes are equivalent to that of the centre difference scheme, whereas where the local grid Reynolds number is large the schemes are equivalent to the upwind difference scheme and ensure that the convergent solution can be

obtained. Therefore, when the centre difference scheme ceases to be effective, the schemes are still effective and their precisions are better than that of upwind scheme solution. The operation counts of these schemes are equivalent to that of centre difference scheme and upwind scheme, so these schemes are efficient and have wider applicability. (5 refs.)

4280 Mathematical model of population evolution in flowing liquid.

O.Ya.Olinik, V.S.Tkalich.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.3, p.47-51 (1983). In Ukrainian.

An extremal model is constructed which describes evolution of a set of populations in the given flow. A system of quasi-canonical equations is obtained which is reduced to a canonical system for an immovable fluid. An extremal model of sensitivity is constructed. The diffusion of populations and limiting components of the substrate are taken into account. (7 refs.)

4281 On one-dimensional stretching functions for finite-difference calculations. M.Vinokur (Mech. Engng. Res., Univ. of Santa Clara, Santa Clara, CA, USA).

J. Comput. Phys. (USA), vol.50, no.2, p.215-234 (May 1983).

The class of one-dimensional stretching functions used in finite-difference calculations is studied. For solutions containing a highly localized region of rapid variation, simple criteria for a stretching function are derived using a truncation error analysis. These criteria are used to investigate two types of stretching functions. One is an interior stretching function, for which the location and slope of an interior clustering region are specified. The simplest such function satisfying the criteria is found to be one based on the inverse hyperbolic sine, first employed by Thomas et al. (1972). The other type of function is a two-sided stretching function, for which the arbitrary slopes at the two ends of the one-dimensional interval are specified. The simplest such general function is found to be one based on the inverse tangent. The special case where the slopes were both equal and greater than one was first employed by Roberts (1971). The general two-sided function has many applications in the construction of finite-difference grids. (18 refs.)

4282 Application of the multigrid method to Poisson's equation in boundary-fitted coordinates. S.Ohring (David W. Taylor Naval Ship Res. & Dev. Centre, Bethesda, MD, USA).

J. Comput. Phys. (USA), vol.50, no.2, p.307-15 (May 1983).

The multigrid technique is a general strategy for solving partial differential equations, based on the elimination of error components. The author applies it to the solution of the Poisson equation in boundary-fitted coordinates; this gives an order of magnitude reduction in computer time. (11 refs.)

4283 Generation of boundary-fitted curvilinear coordinate systems for a two-dimensional axisymmetric flow problem. S.Uchikawa (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan).

J. Comput. Phys. (USA), vol.50, no.2, p.316-21 (May 1983).

The author considers two-dimensional axisymmetric flow; three different coordinate transformations are applied to the solution and compared for suitability. (4 refs.)

4284 The influence of fluctuations on the hydrodynamic asymptotics of Green's functions. Yu.V.Slyusarenko.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.774-80 (May 1983). In Russian.

Hydrodynamic fluctuations are studied for their influence on the time asymptotics of Green's functions and correlation functions in a spatially inhomogeneous case. The behaviour of time asymptotics in the region of large and small wave vectors is also studied. (5 refs.)

Application of Pade approximation to turbulence problem See Entry 75987

03.40K Waves and wave propagation: general mathematical aspects

(see also 46.30M Mechanical and elastic waves, 43.20 General linear acoustics)

74285 Green's function method for periodic traveling wave solutions of the KdV equation. Liu Bao-Ping (Dept. of Math., Sichuan Univ., Chengdu, China), C.V.Pao.

Appl. Anal. (GB), vol.14, no.4, p.293-301 (1983).

The Green's function method is used for studying periodic traveling wave solutions of a generalized KdV equation. It is shown through the construction of an explicit Green's function that the periodic boundary-value problem for the traveling wave solution of the KdV equation is equivalent to an integral equation with a symmetrical kernel which generates a compact operator in the space of periodic functions. This integral representation also leads to the existence of a periodic traveling wave solution for an associated inhomogeneous KdV equation. (7 refs.)

74286 A new evaluation of the Goos-Hanchen shift and associated time delay. K.Yasumoto, Y.Oishi (Dept. of Computer Sci. & Communication Engng., Kyushu Univ., Fukuoka, Japan).

J. Appl. Phys. (USA), vol.54, no.5, p.2170-6 (May 1983).

A wave packet reflected totally at an interface between two media may undergo the Goos-Hanchen shift and associated time delay. Two different theoretical approaches have been presented so far to evaluate this phenomenon. One is the stationary-phase method and the other is the conventional energy-flux method. In this paper, a certain deficiency existing in the conventional energy-flux method is pointed out and a new energy-flux method is derived based on an accurate argument of the conservation of energy flux. The new energy-flux method confirms the consistency of the predictions by the stationary-phase method from the point of view of the conservation of energy. (14 refs.)

74287 A numerical algorithm for solving inverse problems of two-dimensional wave equations. Y.M.Chen (Dept. of Appl. Math. & Statistics, State Univ. of New York, Stony Brook, NY, USA), J.Q.Liu.

J. Comput. Phys. (USA), vol.50, no.2, p.193-208 (May 1983).

The new iterative numerical algorithm of the pulse-spectrum technique (PST) is extended and developed to solve inverse problems of two-dimensional linear wave equations. It has the practical advantages of having the necessary data measured on a portion of the boundary only and no geometric limitation on the testing objects. Numerical simulations on several simple examples are carried out to test the feasibility and to study the general characteristics of this technique without the real measurement data. It is found that PST does give excellent results even with a very coarse computational grid and it is as robust as in the one-dimensional case. (9 refs.)

74288 A one-parameter Backlund transformation for the Euclidean Liouville and wave equations. Huang Xun-Cheng (Shanghai Inst. of Computing Tech., Shanghai, China).

Phys. Scr. (Sweden), vol.27, no.5, p.321-2 (May 1983).

A Backlund transformation with an arbitrary parameter for the Euclidean Liouville equation and wave equation was obtained from the one without parameter. (5 refs.)

74289 Intensification of backscattering of waves by a body located near the irregular boundary of two media. V.U.Zavorotnyi, V.I.Tatarskii (Inst. of Atmospheric Phys., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.566-7 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.608-11 (July 1982). [received: April 1983]

The phenomenon of intensification of backscattering in media with large-scale spatial inhomogeneities has been described and experimentally observed. An analogous effect, but expressed to a much greater degree, can be observed in the scattering of waves by a body located near the irregular boundary of two media if the local coefficient of reflection of a wave from this boundary is close to unity. The theory describing the phenomenon of intensification of backscattering is the same in both cases and is very simple. The authors consider it with scalar waves as an example. The generalization to other cases is carried out in an obvious manner. (4 refs.)

74290 New results on the vibrating string with a continuous obstacle.

A.Bamberger, M.Schatzman (Centre de Maths. Appl., Ecole Polytech., Palaiseau, France).

SIAM J. Math. Anal. (USA), vol.14, no.3, p.560-95 (May 1983).

The authors give an explicit formula which describes the solution of the problem of the linear elastic string vibrating against a plane obstacle without loss of energy. This formula allows one to prove continuous dependence on the initial data; a regularity result in some bounded variation spaces is given. A numerical scheme is deduced from the explicit formula. Finally they prove the weak convergence of a subsequence of solutions of the penalized problem to a 'weak' solution (i.e. one which does not necessarily conserve energy) of the problem with an obstacle when the obstacle is arbitrary; when the obstacle is plane, all the sequence strongly converges to the solution of the obstacle problem which conserves the energy. (7 refs.)

74291 A new procedure for deriving shortened equations for parametrically interacting waves. N.P.Ivonchik, A.M.Fedorchenko.

Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.620-2 (April 1983). In Russian.

Proposes a method of deriving shortened equations which ignores second amplitude derivatives. This method makes it possible to obtain more accurate approximations for parametric nonlinearity. (3 refs.) *V.G.P.*

74292 The fundamental bordered matrix of linear estimation and the Duffin-Morley general linear electromechanical systems. S.K.Mitra, M.L.Puri (Indian Statistical Inst., New Delhi, India).

Appl. Anal. (GB), vol.14, no.4, p.241-58 (1983). (16 refs.)

74293 Theoretical calculation of the anomalous Cerenkov radiation produced in the air. Zhang Ziping, Yang Bingxin, Xi Fuyun, Xu Kezun (Dept. of Modern Phys., Univ. of Sci. & Technol. of China, Hefei, China).

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.2, p.184-9 (Feb. 1983).

Cerenkov radiation is produced when the velocity of charged particles passing through a medium is faster than the phase velocity of light in the same medium. You Junhan and Cheng Fuhua (1980) pointed out that the relativistic electrons moving through a considerable dense hydrogen gas will produce asymmetric line-emission-spectra corresponding to L_{α} and L_{β} lines. Using this phenomenon, the authors used a ^{90}Sr β radiative source with maximum energy of 2.2 MeV and activity of 22 mCi to measure the asymmetries of the angular distribution of the anomalous Cerenkov radiation produced by electrons when passing through the air. The resulting asymmetries at 21° , 30° and 40° are 1.069 ± 0.016 , 1.119 ± 0.016 and 1.048 ± 0.016 respectively, and the wavelengths of photons are near 2000 \AA . The aim of this paper is to give a theoretical calculation of the angular distribution of the anomalous Cerenkov radiation produced in the air through which the electrons pass and to make a comparison of the results with those from experiment. (5 refs.)

03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

74295 Deformations of the algebra of functions on hermitian symmetric spaces resulting from quantization. C.Moreno (Chaire de Phys. Math., Coll. de France, Paris, France), P.Ortega-Navarro.

Ann. Inst. Henri Poincaré Sect. A (France), vol.38, no.3, p.215-41 (1983).

A*-product on a symplectic manifold, in the sense of A. Lichnerowicz (1977, 1980, 1981), is the first element in what should be called Weyl's quantization on the manifold. The covariant symbol $A \star B$ of the operator $A \cdot B$ is an exponential integral with positive phase and \hbar^{-1} as real parameter. The authors give an expression to find each term of the asymptotic development, as powers of \hbar , of this symbol. In this way they obtain a nontrivial formal deformation of the associative algebra $C^\infty(M)$. This deformation is not a Vey deformation at any order, just as in the Wick quantization on C^∞ . Each 2-cochain of the deformation is invariant by the group $\text{I}_0(M)$. Similarly they consider the contravariant Weyl's symbol $A^{\#} \cdot B$ of the operator $A \cdot B$. (In the Weyl's quantization on C^∞ this symbol is just the Moyal product of A and B .)

In this case the deformation obtained is a Vey deformation at the first order. It is no longer a Vey deformation at the second order. (31 refs.)

74296 Charged particles with short range interactions. S.Albeverio (Math. Inst., Ruhr-Univ. Bochum, Bochum, Germany), F.Gesztesy, R.Hoegh-Krohn, L.Streit.

Ann. Inst. Henri Poincaré Sect. A (France), vol.38, no.3, p.263-93 (1983).

Schrodinger Hamiltonians for charged particles with an additional force of very short range studied by scaling techniques and with a view towards low energy parameters. The authors present results for the zero range limit. In particular they give the leading terms for the S-matrix as the range parameter becomes small. As applications they compare the scattering lengths of charged particles and of their neutral counterparts and discuss the level shifts of mesic atoms. (47 refs.)

74297 Semiclassical analysis of low lying eigenvalues. I. Non-degenerate minima: asymptotic expansions. B.Simon (Dept. of Maths. & Phys., California Inst. of Technol., Pasadena, CA, USA).

Ann. Inst. Henri Poincaré Sect. A (France), vol.38, no.3, p.295-307 (1983).

Considers eigenvalues of Schrodinger operators of the form $-\Delta + \lambda^2 \hbar + \lambda g$ where $\hbar \geq 0$ has finitely many minima, each of which is non-degenerate. The author proves a folk theorem about the asymptotic behavior of the n th eigenvalue in the $\lambda \rightarrow \infty$ limit. The author concludes with a few remarks about the extension to Riemannian manifolds because of the significance to Witten's proof of the Morse inequalities. (22 refs.)

74298 Effect of intrinsic degrees of freedom on the quantum tunneling of a collective variable. D.M.Brink, M.C.Nemes, D.Vautherin (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France).

Ann. Phys. (USA), vol.147, no.1, p.171-97 (15 April 1983).

The effect of intrinsic degrees of freedom on tunneling through a potential barrier is discussed using a BKW-like approximation. Intrinsic degrees of freedom are represented by a single harmonic oscillator. The theory leads to a formula for the effect of the coupling on the decay width Γ of a metastable state. When the frequency ω of the intrinsic degree of freedom is large, then $\Gamma \rightarrow \Gamma_{\text{ad}}$ where Γ_{ad} is the decay width calculated with the adiabatic barrier. An inequality $\Gamma \leq \Gamma_{\text{ad}}$ is proved for any form of the coupling Hamiltonian. Corrections are discussed and are shown to be of order $1/M$ where M is the mass of the tunneling coordinate. An application to fission is considered. The generalization of the formula for Γ for the case of many intrinsic degrees of freedom is given explicitly. (11 refs.)

74299 Finite difference method for initial-boundary problem on a class of nonlinear Schrodinger equations. Wu Xianghui.

Acta Sci. Nat. Univ. Sunyatseni (Zhongshandaxue Xuebao) (China), no.4, p.41-6 (1982). In Chinese.

The initial-boundary problem of a class nonlinear Schrodinger equation system is considered by using a finite difference method. It is proved that the four point implicit scheme and the six point implicit scheme for problem are convergent and stable. Finally, a numerical example is given. (2 refs.)

74300 Multi-instanton contributions in quantum mechanics. II. J.Zinn-Justin (CENS, Gif-sur-Yvette, France).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.2, p.333-48 (6 June 1983).

For pt.I see ibid., vol.192, p.125 (1981). The author presents a simplified derivation for the expression of the contribution of multi-instanton configurations in quantum mechanics in the semiclassical limit. The author shows that the expression one obtains is valid not only for the ground state energy but also for all excited states. The author illustrates the method on a few new examples. A relation between the various perturbative expansions of these multi-instanton contributions is conjectured. (7 refs.)

74301 Transverse transport processes of charged particle systems in a strong magnetic field. I. Quantum theory. Ho Yu-ping, Hu xi-wei, Chen Zheng-xiong (Inst. of Plasma Phys., Acad. Sinica, Hefei, China).

Commun. Theor. Phys. (China), vol.1, no.4, p.427-40 (1982).

The quantum theory of the transverse transport of charged particle systems in a strong, uniform magnetic field is reinvestigated. All such previous theories, based on the Kubo formula in the Landau representation, considered only the second-order term of the collisional expansion series. In the authors' theory, they still use the local representation. However, the macroscopic current operator corresponding to real measurements is used in the Kubo formula instead of the microscopically defined current operator. By applying the method of projection operators, they obtain formal expressions for the macroscopic current and then for various transport coefficients. (12 refs.)

74302 On a three-body problem in relativistic quantum mechanics. F.M.Lev (Inst. of Complex Sci. Res., Khabarovsk, USSR).

Fortschr. Phys. (Germany), vol.31, no.2, p.75-130 (1983).

Proceeding from the method of packing operators developed by Sokolov (1978) and from the 'light front variables' technique, the explicit formulae for packing operators and auxiliary mass operators for a system of three particles with arbitrary spins are derived. It is shown that for the packing operators there exists an infinite number of solutions yielding different physical consequences. The problem of the theory substantiation is discussed; the arguments in favour of a certain choice of packing operators are produced. (41 refs.)

74303 A review of recent developments in the theory and applications of geometric quantisation. P.Campbell (Dept. of Math., Univ. of Lancaster, Lancaster, England).

Hadronic J. (USA), vol.6, no.2, p.212-50 (March 1983).

Presents a review of the main elements of the standard Kostant-Souriau (KS)-theory. This takes as its starting point a discussion of the modern formulation of classical mechanical systems via symplectic geometry. The quantisation problem is then stated and the need for a global quantisation scheme is motivated. The (KS)-theory then proceeds through the conceptual levels of prequantisation, polarisation (real), and metaplectic frame bundle to give the construction of the representation space and the form of self-adjoint operators on it. The author deals with the modifications and enlargements of the standard (KS)-theory necessitated in certain cases. The main enlargement concerns the problem of dependence of the quantisation upon polarisation choice; the solution to this problem in terms of the so-called BKS-transformation is described for real and transverse polarisations. A related difficulty concerns the quantisation of a larger class of observables than can be dealt with via the standard (KS)-theory. The author outlines the main ideas behind this and the attempts at its solution. Other modifications deal with the possibility of trivial representation spaces and non-existence of components of the quantisation bundle. The review is concluded with some comments on recent applications of the (KS)-theory. (59 refs.)

74304 Classical and quantum mechanical Hamiltonians for velocity-dependent forces. M.Razavy (Theoretical Phys. Inst., Univ. of Alberta, Edmonton, Alberta, Canada).

Hadronic J. (USA), vol.6, no.2, p.406-39 (March 1983).

For velocity-dependent frictional or relativistic forces which do not depend explicitly on time, a direct non-Lagrangian method of constructing classical

Hamiltonians are given. These Hamiltonians are generally implicit functions of x and p , and only in certain cases can be given explicitly. They are all generators of motion in the coordinate space, and when this is their only required property, their number is infinite. In this method of construction, a generalization of the potential concept is obtained for velocity-dependent potentials, but this generalized potential function depends on the Hamiltonian itself. The problem of quantization is studied in detail for different types of Hamiltonians. It is argued that, while the Dirac rule of correspondence may lead to Heisenberg's equations of motion which are consistent with the canonical commutation relation, this consistency should not be viewed as the sole criterion for a satisfactory formulation of the problem since the results in most cases are unphysical, and the position-velocity uncertainty relation is violated. While an exact method of quantizing an implicit Hamiltonian is not known, for the cases where the momentum is an explicit function of the Hamiltonian and the coordinate, the classical-limit quantization may be used to find approximate wave functions and eigenvalues. (42 refs.)

74305 Bound s-state energies for superposed screened Coulomb potential in Eckert-Weizel approximation. A.P.Kajwadkar, L.K.Sharma (Dept. of Appl. Phys., Government Engng. Coll., Jabalpur, India).

Indian J. Pure & Appl. Phys., vol.21, no.2, p.103-6 (Feb. 1983).

Quantum defect, quantum number shift and bound s-state eigen energies for s states of a superposed screened Coulomb potential have been obtained. It is also observed that this potential possesses features similar to alkali atoms and alkali-like ions. (14 refs.)

74306 Use of $SU(n)$ Lie algebra in n level quantum system. I. Some general consequences. J.Tillieu, A.van Groenendaal (Lab. de Phys. Theorique, Univ. de Lille I, Villeneuve d'Ascq, France).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1807-16 (May 1983). In French.

In an n level quantum system there is a relation between each density operator and an element of $SU(n)$ Lie algebra. This relation is also established between Cartan's subalgebras and the complete sets of compatible observables. A scalar product is then defined in this algebra in order to introduce orthonormal bases and to simplify many calculations about expectation values of observables. Therefore simple general rules were established which show how to determine (completely or partly), from linearly independent observables, the density operator of the system. (13 refs.)

74307 Use of $SU(n)$ Lie algebra in n level quantum system. II. Transformations in the state space, evolution problems. J.Tillieu, A.van Groenendaal (Lab. de Phys. Theorique, Univ. de Lille I, Villeneuve d'Ascq, France).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1817-27 (May 1983).

For PT_1 , see *ibid.*, vol.23, p.1807 (1983). In the previous paper the authors examined, for a quantum system, the relation between its n -dimensional state space and the $SU(n)$ Lie algebra. The present paper is devoted to relations between unitary transformations in the state space and orthogonal transformations in Lie's algebra. Two cases can happen. First, the transformations are independently chosen in the two spaces; this amounts to changing the former relation. On the other hand, the relation is maintained and the unitary operators are then related to some of the orthogonal operators. This second case is used to study the evolution operators. (8 refs.)

74308 Relativistic quantum logic. P.Mittelstaedt (Inst. für Theoretische Phys., Univ. zu Köln, Köln, Germany).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.293-314 (April 1983).

On the basis of the well-known quantum logic and quantum probability a formal language of relativistic quantum physics is developed. This language incorporates quantum logic as well as relativistic restrictions. It is shown that relativity imposes serious restrictions on the validity regions of propositions in space-time. By an additional postulate this relativistic quantum logic can be made consistent. The results are derived exclusively within the formal quantum language; they are, however, in accordance with well-known facts of relativistic quantum physics in Hilbert space. (29 refs.)

74309 Reflections on quantum logic. B.Z.Moroz (Dept. of Math., Hebrew Univ., Jerusalem, Israel).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.329-40 (April 1983).

This is a short, self-contained summary of problems connected with the interpretation of state vectors in quantum mechanics. The author discusses the reconstruction of the ψ function from statistical data, some related mathematical questions, the classical 'paradoxes', the probability interpretation of the state vectors, and, finally, quantum logic in relation to hidden variable theories and Hilbert space formalism to build up a consistent framework for the indeterministic quantum picture of nature. (23 refs.)

74310 Localizability and coupling constants. A.J.Kalnay (Centro de Fisica, IVIC, Caracas, Venezuela).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.359-61 (April 1983).

Considers for free elementary systems the postulates: (i) localizability of systems would not favor in a physical sense some inertial frames and (ii) standard quantum mechanics (or, at least, a skeleton of it) applies for localizability. It is known that, at least for the lower values of spin, (i) and (ii) imply a unique solution of the localization problem for the no-interaction case. Extrapolating the analysis to the case when interactions are present, the author offers arguments in favor of the conjecture that if elementary systems under interaction are localizable, then (i) and (ii) imply restrictions on the coupling constants, and probably their single-valuedness. (7 refs.)

74311 Minimal number of operators for observability of N -level quantum systems. A.Jamiołkowski (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.369-76 (April 1983).

Discusses the minimal number n_{\min} of operators A_1, \dots, A_n , whose expectation values at some instants determine the statistical state of an N -level quantum system. The author assumes that the macroscopic information about the system in question is given by the mean values $\text{Tr}[\rho(t_i)A_i] = m_i(t_i)$ of n self-adjoint operators A_1, \dots, A_n at some instants $t_1 < t_2 < \dots < t_n$, where $s < N^2 - 1$. (9 refs.)

74312 Bell's theorem and backwards-in-time causality. R.I.Sutherland (Dept. of Theoretical Phys., Univ. of New South Wales, Sydney, NSW, Australia).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.377-84 (April 1983).

Bell (1964) has shown that quantum mechanics is incompatible with the notion of locality. The present author begins by considering the possibility of invoking backwards-in-time causality to explain this violation of locality. This then leads to an examination of the possible relevance of backwards-in-time causality to measurement outcomes in general. It is found that the situations in which it could be involved are limited owing to causality paradoxes. (8 refs.)

74313 Geometric dequantization and the correspondence problem. G.G.Emch (Dept. of Math. & Phys., Univ. of Rochester, Rochester, NY, USA).

Int. J. Theor. Phys. (USA), vol.22, no.5, p.397-420 (May 1983).

On the way to settle a conjecture proposed by Mackey. The author first presents in detail a complete solution to the correspondence problem for systems whose configuration space is \mathbb{R}^n . The author then indicates how this can be considered as a first step in the elaboration of a geometric dequantization program which would extend the results to more general manifold. (32 refs.)

74314 Critical dynamics and fluctuations for a mean-field model of cooperative behavior. D.A.Dawson (Dept. of Math. & Statistics, Carleton Univ., Ottawa, Canada).

J. Stat. Phys. (USA), vol.31, no.1, p.29-85 (April 1983).

The author examines in some detail the dynamics and fluctuations in the critical situation for a simple model exhibiting bistable macroscopic behavior. The model under consideration is a dynamic model of a collection of anharmonic oscillators in a two-well potential together with an attractive mean-field interaction. The system is studied in the limit as the number of oscillators goes to infinity. The limit is described by a nonlinear partial differential equation and the existence of a phase transition for this limiting system is established. The main result deals with the fluctuations at the critical point in the limit as the number of oscillators goes to infinity. It is established that these fluctuations are non-Gaussian and occur at a time scale slower than the noncritical fluctuations. The method used is based on the perturbation theory for Markov processes developed by Papanicolaou, Stroock, and Varadhan (1977) adapted to the context of probability-measure-valued processes. (58 refs.)

74315 The hydrogen atom as prototype of the large- N expansion. P.Du, P.duT.van der Merwe (Dept. of Phys., Brown Univ., Providence, RI, USA).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.3, p.86-8 (21 May 1983).

The spectrum of the hydrogen atom in N -dimensions is considered as prototype of the semi-classical method and is shown to yield a closed-form expression for the excitation spectrum, which includes leading large- N quantum fluctuations. (7 refs.)

74316 q -algebras without interaction. P.Siafarikas (Dept. of Maths., Univ. of Patras, Patras, Greece), A.Jannussis, G.Brodimas, L.Papaloucas.

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.3, p.119-23 (21 May 1983).

(12 refs.)

74317 A connection between Borel and Pade summation techniques. M.F.Marziani (Istituto di Fisica, Univ. di Ferrara, Ferrara, Italy).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.3, p.124-8 (21 May 1983).

The recently proposed combination of the Borel summability method with the first confluent form of the ϵ -algorithm of Wynn (1960) for summing the Born series of scattering integral equations, is shown to be equivalent, in a limiting case, to the construction of the sequence of $[n, n-1]$ Pade approximants to the same series. (8 refs.)

74318 Continual measurements for quantum open systems. A.Barchielli (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.2, p.113-38 (11 April 1983).

Starting from the recently introduced formalism of continual measurements in quantum mechanics, it is shown that, for the quantum open systems, it is possible to construct probability distributions for the values at all times of certain observables, without the continual measurement of such observables perturbing the dynamics of the system. More precisely, starting from the quantum description of an open system, a generalized stochastic process for certain observables is constructed, which is independent of the fact that these observables are actually measured or not. The example of the quantum Brownian motion is developed in detail. In such an example it is shown how the a priori arbitrary elements of the formalism are in reality determined by the dynamics of the system. (14 refs.)

74319 Parametrization of open systems with effective quadratic Hamiltonians plus stochastic force. E.S.Hernandez (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina), S.S.Mizrahi.

Physica A (Netherlands), vol.119A, no.1-2, p.159-76 (April 1983).

The evolution generated by general dissipative Hamiltonians is analyzed when a stochastic force is included. Using a mapping technique, the equations of motion for the observables of interest can be given easily. A general dissipativity condition is extracted, whose fulfillment guarantees that thermal equilibrium is reached as the final stage of the evolution. Several existing frictional Hamiltonians are examined and it is seen that the correlation of the fluctuating force is essential to the destruction of a constant of motion inherent to pure quantal behaviour. (23 refs.)

74320 Quantization of the damped harmonic oscillator. H.Gzyl (Escuela de Fisica y Matematicas, Facultad de Ciencias, Univ. Central de Venezuela, Caracas, Venezuela).

Phys. Rev. A (USA), vol.27, no.5, p.2297-9 (May 1983).

By means of a canonical transformation that can be implemented as a unitary change of representation, the authors show how to quantize the damped harmonic oscillator. (5 refs.)

74321 Higher orders of perturbation theory for the screened Coulomb potential. S.P.Alliluev, V.M.Vainberg, V.S.Popov.

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.560-2 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.597-601 (July 1982). [received: April 1983]

The calculation of the higher orders of perturbation theory in quantum mechanics has been significantly advanced recently by the development of logarithmic perturbation theory. The authors consider its application to the screen Coulomb potential. (9 refs.)

74322 Nonlocal Korteweg-de Vries and Kadomtsev-Petviashvili equations. A.I.Bobenko, V.B.Matveev, M.A.Sall' (A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.610-11 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4, p.1357-60 (Aug. 1982). [received: May 1983]

The authors fix a compact Riemann surface Γ of genus g with cut $[Q_1, Q_2]$, a basis of cycles $A_k, B_k, k=1, 2, \dots, g$, a nonspecial divisor $D=\sum_{i=1}^n p_i$, and a complex parameter α . They describe a consistent solution (the Baker-Akhiezer function) of a system of linear equations. The solution is real if $e=-i\theta/2-x_0$, x_0 is real, and the lattice of periods is self-adjoint. Then $\{\tilde{z}\}=\{\tilde{z}\}$. If it is assumed that ω_1 is real and ω_2 is purely imaginary with $\tilde{z}_2 \neq i\tilde{z}_1/2$, where n is an integer, one obtains a solution without singularities—the simple wave of the KdV equation. Degeneration of the solution (with $\omega_1 \rightarrow \infty, \omega_2 = i\pi$ fixed) gives solitons of the nonlocal KdV equation. The degeneration $\omega_2 \rightarrow \infty$, with ω_1 fixed gives the simplest periodic solution without singularities that is expressible in terms of the elementary functions. The double degeneration $\omega_1 \rightarrow \infty, \omega_2 \rightarrow \infty$ gives the simplest rational solutions. (6 refs.)

74323 Analysis of a bilinear relation for the six-vertex model. V.E.Korepin (V.A. Steklov Math. Inst., Acad. of Sci., USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.612-13 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1361-4 (Aug. 1982). [received: May 1983]

The quantum method of the inverse scattering problem enables one to solve a wide class of two-dimensional models in statistical physics and quantum field theory. The most important quantity in this method is the monodromy matrix $T(\mu)$. The author considers the case when the dimensionality of this matrix is two. The matrix elements of $T(\mu)$ are quantum operators which depend on the spectral parameter μ . The authors construct a $T(\mu)$ which satisfies $R(\lambda, \mu)T(\lambda) \otimes T(\mu) = T(\mu) \otimes T(\lambda)R(\lambda, \mu)$, and $A(\mu)|0\rangle = a(\mu)|0\rangle$, $D(\mu)|0\rangle = d(\mu)|0\rangle$, $C(\mu)|0\rangle = 0$, $B(\mu)|0\rangle \neq 0$. A, B, C and D are the matrix elements of $T(\mu)$. (8 refs.)

74324 Differential rings used in Shirokov algebras. G.K.Tolokonnikov (V.A. Steklov Math. Inst., Acad. of Sci., USSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.952-4 (Oct. 1982). Translation of: *Theor. & Math. Fiz. (USSR)*, vol.53, no.1, p.16-19 (Oct. 1982).

A classification is given of differential algebras that include r^2 , $\delta(x)$, $x \in \mathbb{R}^n$, $\alpha=0$, ± 1 , $\pm 2, \dots$, and satisfy the condition $\phi\psi=0$ for elements ϕ, ψ : $\text{supp } \phi \subseteq \{0\}$, $\text{supp } \psi \subseteq \{0\}$. (10 refs.)

74325 Nonlinear Schrödinger equation with noncompact isogroup. V.G.Makhan'kov, O.K.Pashaev (Joint Inst. for Nuclear Res., Dubna, USSR). *Theor. & Math. Phys. (USA)*, vol.53, no.1, p.979-87 (Oct. 1982). Translation of: *Theor. & Math. Fiz. (USSR)*, vol.53, no.1, p.55-67 (Oct. 1982).

The properties of the nonlinear Schrödinger equation with noncompact isogroup are investigated. The example of the $U(1,1)$ nonlinear Schrödinger equation reveals the significant differences between this system and the previously considered vector nonlinear Schrödinger equation. The main feature—the large set of admissible boundary conditions on the field functions—leads to a rich spectrum of solutions of the system. Four types of boundary conditions and the corresponding soliton solutions are considered for the $U(1,1)$ model. Quasiclassical quantization of the solitons admits an interpretation in the language of 'drops' and 'bubbles' as bound states of a large number of bosons of the basic fields subject to the thermodynamic relations for a mixture of gases. The system is a continuous 'analog' of the Hubbard model for zero-value boundary conditions, and therefore the authors end with a discussion of this case. (16 refs.)

74326 WKB integrals for some central potentials and analytic expressions for energy eigenvalues. M.Seetharaman (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982. (Bombay, India: Dept. Atomic Energy 1982), p.74

Summary form only given, as follows. The author carries out a direct evaluation of the integrals arising in the lowest order WKB quantization of the potentials: (i) $V(r) = 1/2\omega^2 r^2 + \lambda r^4$ (anharmonic oscillator), (ii) $V(r) = \mu r - \beta/r$ (charmonium potential). The implicit relation for the bound state energies is found to be expressible in terms of complete elliptic integrals. The author demonstrates how to carry out an approximate non-perturbative inversion of this implicit relation and arrives at explicit analytic expressions for E. These are in good agreement with known numerical results for these potentials.

03.70 THEORY OF QUANTIZED FIELDS

(see also 11.10 Field theory)

74327 On the vanishing of correlation-connected diagrams in Hall's diagram technique. S.G.Tikhodeev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.624-5 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.867-70 (Aug. 1982). [received: May 1983]

A diagram formalism for nonequilibrium processes which takes into account initial correlations was constructed by Hall (1975). In this graph method, a solid line on the graph corresponds to a matrix free Green function. The author generalizes the theorem proved by Hall about the vanishing of diagrams containing blocks $P^2 = \square$, and thus substantially decreases the number of nonvanishing diagrams. For instance, all connected diagrams which are obtained by adding correlation lines to a disconnected Keldysh diagram, as well as all diagrams in which all incoming and outgoing lines belong to correlators, are automatically correlation-connected and hence equal to zero. (3 refs.)

74328 Some solutions of the Einstein system of field equations corresponding to Taub metric. M.Bray.

Ann. Inst. Henri Poincaré Sect. A (France), vol.38, no.3, p.243-53 (1983). In French.

For several energy-momentum distributions (perfect fluid, thermodynamic dust, meson vector field) the integration of the complete Einstein system of field equations leads to some exact solutions possessing the plane symmetry defined by A.H. Taub (1951) (existence of a three parameter group of motions). (2 refs.)

74329 Rotational perturbations of Friedmann universes in Einstein zero mass scalar theory. K.D.Krori, J.C.Sarmah, D.Goswami (Math. Phys. Forum, Cotton Coll., Gauhati, India).

Can. J. Phys. (Canada), vol.61, no.5, p.744-7 (May 1983).

In an extension of a recent work by Bayin and Cooperstock (Phys. R&D, vol.22, p.2317, 1980) the authors investigate rotational perturbations of Friedmann universes in Einstein zero mass scalar theory. They find that except in

the case of 'perfect dragging', the zero mass scalar field has a damping effect on the rotation of matter. One of the three cases studied shows that the scalar field may exist only during a certain interval in the course of the evolution of the universe. The zero mass scalar field has acquired particular importance recently because of a suggestion by Weinberg and Wilczek (1978) that there should exist a pseudo-scalar boson, the so-called axion, of negligible mass. The work of Peccei and Quinn (1979) has lent further support to the idea of axions. (5 refs.)

74330 Viscous fluid in static spherically symmetric space-time. S.R.Maiti (Dept. of Phys., Midnapore Coll., Midnapore, India).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.363-8 (April 1983).

Presents a static spherically symmetric viscous fluid solution of the Einstein field equation, assuming an equation of state $p = (\gamma - 1)\rho$. Though static, the solution has expansion, shear, and acceleration and can explain the cosmological red shift. Also it has a particle horizon. The singularity at the origin and larger viscosity make it unfit to represent a real universe. (4 refs.)

74331 Algebraic determination of the metric from the curvature in general relativity. G.S.Hall (Dept. of Math., Univ. of Aberdeen, Aberdeen, Scotland), C.B.G.McIntosh.

Int. J. Theor. Phys. (USA), vol.22, no.5, p.469-76 (May 1983).

The general solution for a symmetric second-order tensor X of the equation $X_{ab}R^{ab}_{cd} = 0$, where R is the Riemann tensor of a space-time manifold, and X is obtained in terms of the curvature 2-form structure of R by a straightforward geometrical technique, agrees with that given by McIntosh and Halford (1981, 1982) using a different procedure. Two results of earlier authors are derived as simple corollaries of the general theorem. (16 refs.)

74332 New general relativity—translation gauge theory. T.Shirafuji (Phys. Dept., Saitama Univ., Saitama, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.16-25

In 1956 Utiyama proposed to introduce the gravitational fields as the gauge field of the Lorentz group. 24 fields were introduced by generalizing 6 constant parameters ω_{ij} ($= -\omega_{ji}$) for homogeneous Lorentz transformations to arbitrary functions $\omega_{ij}(x)$. The theory of gravitation based on the Weitzenböck space-time was called new general relativity. The author studies this translational gauge theory with reference to experimental tests. (14 refs.)

74333 Generalizations of gravitational theory based on group covariance. L.Halpern (Res. Inst. for Fundamental Phys., Kyoto, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.26-30

The author develops a physical formalism of gravitation from symmetry group mathematics. The physics is dictated by mathematics based on semisimple Lie groups. (11 refs.)

74334 Space-time structure of gravitational solitons. A.Tomimatsu (Res. Inst. for Theoretical Phys., Hiroshima Univ., Hiroshima, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.36-40

The axially symmetric and stationary soliton solution of Einstein's equations in a vacuum has been found by means of the inverse scattering problem technique. This solution has metric of the form $ds^2 = g_{ab}dx^a dx^b + h(dp^2 + dz^2)$, where $a, b = t, \phi$. (7 refs.)

74335 Pregelometry. K.Akama (Dept. of Phys., Saitama Medical Coll., Saitama, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.267-71

The author adopts the dynamics of the Nielsen-Olesen vortex (1973) in a six-dimensional flat space-time, and shows that general relativity actually holds in four-spacetime. (5 refs.)

74336 The role of Newton's constant in Einstein's gravity. V.de Alfaro (Inst. di Fisica Teorica, Univ. di Torino, Torino, Italy).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.149-75

Develops some remarks about the Einstein theory of gravity, called General Relativity after its invariance transformations. In particular the author addresses the role of the Newton constant according to the point of view that has been developed by Sergio Fubini, Giuseppe Furlan and the author (1979, 1980), and to the consequences of this point of view. 04.30 GRAVITATIONAL WAVES AND RADIATION: THEORY

74337 On the Hawking radiation in a stationary Riemann space-time. Liu Liao (Dept. of Phys., Beijing Normal Univ., Beijing, China), Zhao Zheng.

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.3, p.357-60 (March 1983).

It is well known that the thermal radiations from black holes, the Rindler radiations and the thermal radiations in de Sitter universe all come from the horizons. In a previous paper (1981), the authors put forth the conjecture, that the Hawking thermal radiation must exist in a stationary gravitational field, which has a horizon and the gravitational field on it is not zero. Now they prove the conjecture for a $1+1=2$ -dimensional static gravitational field. (7 refs.)

74338 Symmetries of the radiative Robinson-Trautman metrics. S.I.Tertychniy, V.V.Zhytnikov (Theoretical Phys. Dept., Moscow State Univ., Moscow, USSR).

Phys. Lett. A (Netherlands), vol.95A, no.8, p.419-21 (23 May 1983). The geometrical properties of radiative Robinson-Trautman metrics are presented. (5 refs.)

74339 Post-Newtonian gravitational radiation of a binary system of relatively extended bodies in the field theory of gravitation. A.A.Vlasov (Moscow State Univ., Moscow, USSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.998-1003 (Oct. 1982). Translation of: *Theor. & Math. Fiz. (USSR)*, vol.53, no.1, p.83-92 (Oct. 1982).

The post-Newtonian gravitational radiation of a binary system of relatively extended static spherically symmetric bodies in the field theory of gravitation is considered. (2 refs.)

74340 Absence of particle creation as an equilibrium condition. L.Parker (Dept. of Phys., Univ. of Wisconsin, Milwaukee, WI, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.89-95

From the observed range of validity of the Newtonian approximation, the cosmological constant Λ is known to be very small. In view of the fact that vacuum energy can contribute to the value of Λ , especially in conjunction with symmetry breaking, it is puzzling that the value of Λ is so small. The basic hypothesis is that the absence of particle creation, in particular, gravitons and minimally coupled massless scalar particles, is a kind of equilibrium condition toward which the evolution of the Universe tends, and that the classical Einstein equations must be consistent with that condition. (20 refs.)

04.40 CONTINUOUS MEDIA; ELECTROMAGNETIC AND OTHER MIXED GRAVITATIONAL SYSTEMS

74341 Properties of a spin fluid in a Riemann-Cartan spacetime. R.de Ritis (Istituto di Fisica Teorica, Univ. di Napoli, 19, Napoli, Italy), M.Lavorgna, G.Platania, C.Stornaiolo.

Phys. Lett. A (Netherlands), vol.95A, no.8, p.425-8 (23 May 1983).

The authors extend to the case of spin fluids in the Einstein-Cartan theory some results obtained by Taub (1959) and Lichnerowicz (1967) for a perfect fluid in general relativity. So doing they also give an extension of the Bernoulli theorem. They show a connection between torsion and a macroscopic quantity, the tensor $\Omega_{ij} = 2V[\gamma]_{ij}$. (7 refs.)

74342 Self-gravitating null fluids. P.S.Letelier (Dept. de Fisica, Univ. de Brasilia, Brasilia, Brazil).

Rev. Bras. Fis. (Brazil), vol.12, p.61-5 (March 1982). [received: April 1983]

An algorithm for generating solutions to the Einstein equations with a null fluid source, from vacuum solutions, is studied for space-times that admit an Abelian group of motions G_2 that act orthogonally transitively. (13 refs.)

74343 On the phenomenon of rotation of the polarization vector of gravitational and neutrino waves in a strong neutrino radiation field. L.Yu.Blazhenova-Mikulich, N.R.Sibgatullin (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.603-4 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.849-52 (Aug. 1982). [received: May 1983]

considers the propagation of short gravitational and electromagnetic waves in an external field which is an arbitrary solution of the Einstein-Maxwell-Weyl equations. In this case there appears a small parameter, namely, the ratio of the characteristic scale of inhomogeneities of the perturbations to the characteristic scale of the space-time inhomogeneities of the background. One can look for a solution by expanding in powers of this small parameter. The presence of a background neutrino field leads to the result that the plane of polarization of a gravitational wave is rotated with the angular velocity defined by the expression $\omega = 8\pi G\hbar/c^2(n_+ - n_-)$, where n_+ and n_- are, respectively, the local densities of neutrinos and antineutrinos near the wave-front surface. The neutrinos and antineutrinos rotate the plane of polarization in opposite directions. The value of $G\hbar/c^2$ is of the order of 10^{-32} cm³.sec⁻¹, so that the phenomenon is weak and needs strong neutrino fields in order to be seen. (2 refs.)

04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

74344 Vanishing of the cosmological constant in non-Abelian Kaluza-Klein theories. M.W.Kalinowski (Inst. of Philosophy & Sociology, Polish Acad. of Sci., Warsaw, Poland).

Int. J. Theor. Phys. (USA), vol.22, no.5, p.385-96 (May 1983).

The author presents a new approach to the unification of gravity and non-Abelian gauge fields in the framework of Kaluza-Klein theory. It consists of introducing a new connection on the $(n+4)$ -dimensional manifold P (metrized principal fiber bundle). This connection is metrical, but with nonvanishing torsion. An enormous cosmological term in the Einstein equations vanishes due to this connection. The new connection simultaneously cancels Planck's mass term in the Dirac equation for the five-dimensional case. The usual interpretation of geodesic equations is still valid. (20 refs.)

74345 Perturbation of an exact strong-gravity solution. S.A.Baran (Internat. Centre for Theoretical Phys., Trieste, Italy).

Nuovo Cimento B (Italy), vol.74B, ser.2, no.2, p.121-20 (11 April 1983).

Perturbations of an exact strong-gravity solution are investigated. It is shown, by using the new multipole expansions previously presented, that this exact and static spherically symmetric solution is stable under odd-parity perturbations. (12 refs.)

74346 Extra space-time dimensions: towards a solution to the cosmological constant problem. V.A.Rubakov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR), M.E.Shaposhnikov.

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.139-43 (26 May 1983).

The authors discuss the possibility that the cosmological constant problem is solved by raising the number of spatial dimensions a la Kaluza-Klein. In $(4+2)$ -dimensional pure gravity theory with the explicit Λ -term they find classical solutions with vanishing physical cosmological constant and compact 2-dimensions. However, there also exist solutions with the non-vanishing physical Λ -term, and the case $\Lambda_{\text{phys}}=0$ is not preferred at the classical level. They

conjecture that quantum corrections and/or additional interactions single out the solution with vanishing physical cosmological constant. (11 refs.)

74347 A geometrical foundation of a unified field theory. N.Rosen (Technion-Israel Inst. of Technol., Haifa, Israel), G.E.Tauber.

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.301-5

Einstein and Mayer (1931) proposed a formalism by which they were able to obtain a theory of gravitation and electro-magnetism similar to that of Kaluza and Klein. Instead of assuming, as these authors did, the existence of a five-dimensional continuum, they assumed that at each point of space-time, regarded as a Riemannian space, there exists a five-dimensional vector space. The authors generalize the approach of Einstein and Mayer to N-dimensions, and lay down the geometrical foundation of a possible unified field theory of gravitation with other fields. (6 refs.)

04.60 QUANTUM THEORY OF GRAVITATION

74348 Why is the cosmological constant small? S.G.Rajeev (Phys. Dept., Syracuse Univ., Syracuse, NY, USA).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.144-6 (26 May 1983).

The author argues that singular metrics with finite action should be allowed in the path integral of quantum gravity. The path integral over such conformally flat configurations is studied. It is shown that the system is equivalent to a Coulomb gas. The cosmological constant acts as a charge density in this gas. Due to Debye screening, the effective cosmological constant at macroscopic distances is very small. Quantum gravity may thus explain the vanishing of the cosmological constant. (8 refs.)

74349 Manifestly covariant canonical formalism of quantum gravity—a brief survey. N.Nakanishi (Res. Inst. for Math. Sci., Kyoto Univ., Kyoto, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.171-83

General relativity and quantum field are two successful fundamental theories of physics. It is, therefore, of very fundamental importance to unify both theories in a consistent manner. The author presents a quantum field-theoretical formalism of gravity. (37 refs.)

74350 A gauge invariant resummation of quantum gravity. A.Strominger (Inst. for Advanced Study, Princeton, NJ, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.184-8

Quantum gravity is expanded in powers of $1/D$, where D is the number of dimensions. The extra dimensions are highly compactified. The expansion is gauge invariant. The leading term is equivalent to the iterated one loop matter corrections due to a free, massless scalar field without the $1/6 R\phi^2$ term necessary for conformal invariance. The $1/D$ expansion is renormalizable. Flat space is found to be unstable under small fluctuations. (3 refs.)

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.189-203

The author presents a configuration space of quantum gravity where the gauge transformed orbits comprise an infinite dimensional manifold. (no refs.)

74352 Induced gravitation. S.L.Adler (Inst. for Advanced study, Princeton, NJ, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.3-27

Describes some recent work which offers the possibility of both relating the gravitational and unification mass scales, and of permitting the formulation of a quantum theory of gravitation as a renormalizable field theory. The basic premise of what follows, first suggested by A.D. Sakharov (1967), is that the Einstein action is not a fundamental action at all, but rather is an induced effect—in Sakharov's words the 'metrical elasticity of space'—resulting from quantum fluctuations of the matter fields. (15 refs.)

74353 Induced gravity in quantum theory in a curved space. E.Etim (Dept. of Phys., Siegen Univ., Siegen, Germany).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.367-86

The reason for interest in the unorthodox view of first order ($\sim R(x)$) gravity as a matter-induced quantum effect is really to find an argument not to quantise it. According to this view quantum gravity should be constructed with an action which is, at least, quadratic in the scalar curvature $R(x)$. Such a theory will not contain a dimensional parameter, like Newton's constant, and would probably be renormalisable. The author intends to acquaint the non-expert with the phenomenon of induction of the scalar curvature term in the matter Lagrangian in a curved space in both relativistic and non-relativistic quantum theories. (9 refs.)

04.65 SUPERGRAVITY

74354 The stability of gauged supergravity. G.W.Gibbons, C.M.Hull, N.P.Warner (Univ. of Cambridge, Cambridge, England). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.173-90 (30 May 1983).

The authors establish classical positive energy theorems for the gauged supergravity models. These results show that the maximally supersymmetric vacuum states for these theories are supersymmetric anti-de Sitter space-times which, despite the presence of negative local energy densities are stable. They also discuss spontaneous symmetry breaking in these models. (22 refs.)

74355 The geometrical hierarchy model and $N=1$ supergravity. B.A.Ovrut (Dept. of Phys., Rockefeller Univ., New York, NY, USA), S.Raby.

Phys. Lett. B (Netherlands), vol.125B, no.4, p.270-4 (2 June 1983).

The authors incorporate the geometrical hierarchy model of Dimopoulos and Raby (1982) into $N=1$ supergravity. Supersymmetry is spontaneously broken at a scale of order 10^{11} GeV and the cosmological constant is fine tuned to zero. A grand unification mass of order M_{Planck} is induced at tree level. They discuss the low energy ($E \sim$ gravitino mass) theory and the ramifications of their model for proton decay. (9 refs.)

74356 Weak symmetry breaking by radiative corrections in broken supergravity. J.Ellis, J.S.Hagelin (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), D.V.Nanopoulos, K.Tamvakis.

Phys. Lett. B (Netherlands), vol.125B, no.4, p.275-81 (2 June 1983).

Weak interaction gauge symmetry breaking can be generated by radiative corrections in a spontaneously broken supergravity theory, provided the top quark is heavy enough. In one class of such theories the weak Higgs vacuum expectation values are determined by dimensional transmutation a la Coleman-Weinberg (1973), and may be considerably larger than the magnitudes of SUSY breaking mass parameters. In this scenario $m_t \geq 65$ GeV, the supersymmetric partners of known particles may have masses $\ll m_W$, the mass of the lighter neutral scalar Higgs boson is determined by radiative corrections, and there is some variant of a light pseudoscalar axion. In contrast to conventional Coleman-Weinberg models, the weak phase transition is second order and there is no likelihood of excess entropy production. (25 refs.)

74357 Stability of gravitational merons. K.G.Akdeniz (Dept. of Phys., Univ. of Istanbul, Istanbul, Turkey), A.Hacinliyan, J.Kalayci.

Phys. Lett. B (Netherlands), vol.125B, no.4, p.291-4 (2 June 1983).

The authors find that in gravitational models containing Yang-Mills fields merons are unstable. They use a model examined by de Alfaro, Fubini and Furlan (1980). In this model gravitation is coupled to matter fields as the effective (neglecting odd parity and spinorial fields) part of $N=4$ lagrangian for supergravity with $SU(2) \times SU(2)$ local invariance, where supersymmetry fixes uniquely the ratio between the cosmological constant and the color charge. (10 refs.)

74358 Grand unified theories with symmetry and local supersymmetry. R.Arnowitt, P.Nath, A.H.Chamseddine (Dept. of Phys., Northeastern Univ., Boston, MA, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.231-9

The properties of local supersymmetric (LS) grand unified models based on the gauge group $(N=1 \text{ supergravity}) \times SU(5)$ are described. The gravitational interactions of supergravity causes a dynamical symmetry breaking of both $SU(2) \times U(1)$ and supergravity at the mass $m_2 = km^2 \sim 300$ GeV where m is the scale of supersymmetry breaking. These results are maintained at the one loop level. The models described are relativistic in that they are in accord with low energy phenomenology. (20 refs.)

74359 Consistency of coupling in supergravity with propagating Lorentz connexion. H.Nishino (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.249-53

Gauge principle is the most successful scheme in grand unifications of three kinds of interactions other than the gravitational interaction. The recent hierarchy problem of grand unification theories motivates consideration of supersymmetric extensions. Once supersymmetry is introduced in the description of nature, there is no theory other than supergravity which is consistent with the gravitational interaction. The author presents a supergravity theory with propagating Lorentz connexion. (9 refs.)

74360 Dimensional reduction. P.G.O.Freund (Dept. of Phys., Enrico Fermi Inst., Univ. of Chicago, Chicago, IL, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.259-61

The author considers cosmologies in which the effective space-dimensionality is time dependent. Starting with 11-dimensional supergravity, dimensional reduction gauge symmetries are applied. (14 refs.)

74361 One-loop divergences and β -functions in supergravity theories. E.S.Fradkin, A.A.Tseytlin (Dept. of Theoretical Phys., P.N. Lebedev Phys. Inst., Moscow, USSR).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.293-300

The authors present results on explicit calculations (of counter-terms, β -functions, off shell and asymptotic behaviour) in quantum supergravity. (13 refs.)

05.20 STATISTICAL MECHANICS

74363 Cluster partition functions for a two-dimensional hard core square well gas. S.M.T.de la Selva, R.Dickman, W.C.Schieve, C.Canestaro (Center for Studies in Statistical Mech. & Thermodynamics, Univ. of Texas, Austin, TX, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6885-9 (1 June 1983).

The authors study physical (or Hill's) clusters in a two-dimensional hard core square well (HCSW) system. Partition functions for clusters of five or fewer particles have been determined, using both 'proximity' and 'negative energy' bond definitions. The cluster size distributions calculated on the basis of the partition functions are in good agreement with molecular dynamics simulations of the HCSW system. (7 refs.)

74364 Lower bounds for Wiener integrals. E.P.Gross (Dept. of Phys., Brandeis Univ., Waltham, MA, USA).

J. Stat. Phys. (USA), vol.31, no.1, p.115-28 (April 1983).

Techniques are developed to sharpen lower bounds for density matrices occurring in statistical mechanics. The Wiener integrals are treated by insertion of trial functionals and parametric representations of unity that involve functionals of the path. Jensen's inequality is applied to suitable parameter-dependent path measures. These yield stronger forms than the basic Feynman bound. The author also introduces trajectory insertions, and uses coupling constant integration and the hierarchy for correlation functions to improve the bounds. (10 refs.)

74365 Dynamics of a two-level system and estimate of the relaxation time. N.N.Bogolyubov, Jr., Fam Le Kien, A.S.Shumovskii (Joint Inst. for Nuclear Res., Dubna, USSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.1014-18 (Oct. 1982). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.108-13 (Oct. 1982).

The generalized kinetic equation for a system of two-level emitters interacting with the electromagnetic field obtained previously (1981) is used to find an equation for the single-particle distribution function and to investigate relaxation processes. (11 refs.)

05.30 QUANTUM STATISTICAL MECHANICS

(see also 67. Quantum fluids, and 71. Electron states in condensed matter)

74366 On theory of the statistical generating functional for the order parameter. III. Effective action formalism for the order parameter. Zhou Guang-zhao, Su Zhao-bin, Hao Bai-jin, Yu Lu (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.4, p.389-403 (1982).

For pt.II see *ibid.*, vol.1, no.3, p.307-18 (1982). A practical scheme is proposed to determine the quantum statistical properties of the order parameter in the framework of the closed time-path Green's functions (CTPGF). As a microscopic quantum theory, this formalism is applicable in principle to both equilibrium and nonequilibrium phenomena and is capable of dealing with statistical systems both above and below their phase transition point. This formalism can be used to discuss the statistical properties of simple as well as composite order parameters in either uniform or nonuniform systems. As simple illustrations and check for the theory, the proposed prescription is applied to the contact-interaction model for superconductivity and a unimode laser system coupled with two-energy level bound electrons. (11 refs.)

74367 Studies in the configuration interaction method. II. Generating functions and recurrence relations for the number of many-particle configurations. J.Katriel, R.Pauncz (Dept. of Chem., Technion-Israel Inst. of Technol., Haifa, Israel), J.J.C.Mulder.

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1855-67 (May 1983).

For pt.I, see *Int. J. Quantum Chem. Quantum Chem. Symp.*, vol.15, p.101 (1981). Generating functions are constructed and recurrence relations are derived for the number of configurations of any number of particles with an arbitrary elementary spin for both fermions and bosons. Similar results are obtained for the number of configurations specified by the total weight and by the degree of excitation. (7 refs.)

74368 A set of 'ground hypotheses' for elementary-particle statistics. D.Costantini (Istituto di Statistica, Univ. di Bologna, Bologna, Italy), M.C.Galavotti, R.Rosa.

Nuovo Cimento B (Italy), vol.74B, ser.2, no.2, p.151-8 (11 April 1983).

A 'rational reconstruction' of the Maxwell-Boltzmann, Bose-Einstein and Fermi-Dirac statistics is proposed, that is a set of conditions (ground hypotheses) implying the probability functions which determine the above statistics. In order to accomplish this purpose, methods, language and results of inductive logic are adopted. (5 refs.)

74369 Exact ground states for a class of linear quantum spin systems. V.J. Caspers (Twente Univ. of Technol., Enschede, Netherlands), W. Magnus. *Physica A (Netherlands)*, vol.119A, no.1-2, p.291-4 (April 1983).
The singlet pair state (SPS) is shown to be the exact ground state for a class of linear quantum spin systems with anisotropic interactions. (4 refs.)

74370 Dynamics of classical and quantum spin systems with random fields. D. Boyanovsky, J.L. Cardy (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5557-69 (1 May 1983).

The authors study the effect of quenched time-independent random fields coupled linearly to the order parameter on the dynamical critical behavior of spin systems. They assume that the dynamics is described by a Langevin equation without conservation of the order parameter. It is shown that the dominant fluctuations are those induced by the random fields and, therefore, thermal fluctuations are irrelevant. This allows them to establish a relation between this model and a quantum spin system in the presence of a quenched random field. Moreover, they find that only static exponents in D dimensions are the same as those of the pure $(D-2)$ -dimensional theory, but the dynamical exponent z does not satisfy this relation. The quantum system in D dimensions is studied through its $(D+1)$ -dimensional equivalent model where the quenched random fields are totally correlated in the additional imaginary-time τ direction. The system is anisotropic, and there is a new exponent z_A associated with the scaling behavior in the τ direction. They find the relation $z_A = 2z_A$ to all orders in perturbation theory. For the zero-temperature quantum model they find that the static (zero-frequency) exponents are the same as those of the $(D-3)$ -dimensional pure quantum model. At finite temperature, when the classical system is finite in the τ direction, they predict a crossover to D -dimensional classical behavior in nonstatic response and correlation functions, with crossover exponent $(z_A \nu_{(D-2)})^{-1}$, where $\nu_{(D-2)}$ is the exponent ν for the $(D-2)$ -dimensional pure classical system. The static correlation functions do not have this crossover behavior and are the same as those of the $(D-3)$ -dimensional pure quantum model. The dimensional shift in static quantities for both quantum and classical dynamical systems is a consequence of a supersymmetry in the underlying field theory. The exponent $\lambda = 1 + \eta + O(1/N^2)$ in the large- N limit or $z_A = 1 + \eta + O(\epsilon^2)$ in the ϵ expansion where $\epsilon = 1 - d/(N+2)$ and η is the same as in the $(D-2)$ dimensional pure classical system. They also study the above classical random-field Ising problem using the interface approach, but are unable to draw any definite conclusion about the dynamics at the lower critical dimension $d=3$. 05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

74371 Percolation. Models, analog and numerical simulations. J.P. Clerc, G. Giraud, J. Rousselle, R. Blanc (Dept. de Phys. des Systemes Desordones, Univ. de Provence, Marseille, France), J.P. Carton, E. Guyon, H. Ottavi, D. Stauffer.

Ann. Phys. (France), vol.8, no.1, p.5-105 (1983). In French.

This review article considers the problems in percolation using several complementary approaches: experimental simulations, numerical experiments, as well as statistical treatments and theoretical methods inherited from phase transition problems (such as scaling and real space renormalization). A simple introduction to the statistical concepts in percolation theory is given. The authors describe the results of numerical simulations, based on Monte Carlo methods, which also give a concrete grasp to the basic statistical definitions. Simulations are made in the critical regime around the percolation threshold p_c (where p is the probability that a given fraction of sites or bonds are active in a lattice) but also near $p=0$ or $p=1$ where the statistical characteristics of clusters can also be studied. The authors also discuss a method of exploration on incompletely connected networks, known as 'the ant on a labyrinth'. This random walk problem provides an intermediate situation between percolation and diffusion. They discuss in some detail the original contribution of percolation to the study of the electrical conductivity of a composite medium. The authors discuss two classes of problems in which different directions of space are not identical. Finally a first approach to the study of surface phenomena in percolation is given. (159 refs.)

74372 Zero-one law and asymptotic behaviour of transition probabilities of Markov processes. D. Revuz (Univ. Paris-VII, Paris, France).

Ann. Inst. Henri Poincaré Sect. B (France), vol.19, no.1, p.9-24 (1983). (15 refs.)

74373 Functional central-limit theorems for Markov processes. A. Tounti (Ecole Normale Supérieure, Bizerte, Tunisia).

Ann. Inst. Henri Poincaré Sect. B (France), vol.19, no.1, p.43-55 (1983). In French.

Extends the results of Maignet (1979), on Harris positive recurrent chains to positive recurrent Markov processes. (17 refs.)

74374 Stochastic transport in disordered systems. M. Sahimi, B.D. Hughes, L.E. Scriven, H.T. Davis (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6849-64 (1 June 1983).

The authors develop a theory of stochastic transport in disordered media, starting from a linear master equation with random transition rates. A Green function formalism is employed to reduce the basic equation to a form suitable for the construction of a class of effective medium approximations (EMAs). The lowest order EMA, developed in detail here, corresponds to recent approximations proposed by Odagaki and Lax (Phys. Rev. B 24, 5284, 1981), Summerfield (Solid State Commun. 39, 401, 1981), and Webman (Phys. Rev. Lett. 47, 1496, 1981). It yields an effective transition rate W_m which can be identified as the memory kernel of a generalized master equation, and used to define an associated continuous-time random walk on a uniform lattice. The long-time behavior of the mean-squared displacement arising from an initially localized state can be found from W_m as can diffusion constants in any case where the long-time behavior of the system is diffusive. Detailed calculations are presented for seven lattice systems in one, two, and three dimensions, and for a variety of probability density functions $f(w)$ for the transition rates. For percolation-type densities, i.e., those with only a fraction $p < 1$ of the bonds transmitting, the EMA predicts three distinct kinds of behavior: localization, 'fractal' transport with slower than linear growth of the mean-squared displacement, and diffusion in the cases $p < p_c$, $p = p_c$, $p > p_c$, respectively, where p_c is the bond percolation threshold of the lattice. Depending on the form of $f(w)$ near $w=0$, critical exponents may take values independent of $f(w)$ ('universality') or heavily dependent on $f(w)$ ('nonuniversality'). (73 refs.)

74375 A simple derivation of Langevin equations for nonequilibrium states. M. Ichihara (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1541-8 (May 1983).

In the spirit of the linear response theory, a simple derivation is given of a Langevin equation for collective modes of a macroscopic system. Unlike the usual treatment, the author separates a weak interaction of individual particles with collective modes which is allowed to depend on time. In nonequilibrium cases, the author has shown that a damping constant of the collective modes can be expressed in terms of a time correlation function, in which its average is taken with respect to a nonequilibrium density matrix rather than a usual canonical density matrix. A microscopic expression for a Langevin random force is obtained in terms of fluctuations of a density matrix.

74376 Noise-induced order. K. Matsumoto, I. Tsuda (Dept. of Phys., Kyoto Univ., Kyoto, Japan).

J. Stat. Phys. (USA), vol.31, no.1, p.87-106 (April 1983).

A new noise effect on chaos in one-dimensional mappings is reported. The transition from chaotic behavior to ordered behavior induced by external noise is observed in a certain class of one-dimensional mappings. This transition is clearly shown in terms of the Lyapunov number, entropy, power spectrum, and the nature of orbits. (14 refs.)

74377 Modeling and analysis of dynamical systems subject to discontinuous noise processes. S.K. Srinivasan, S. Udayabhaskaran (Dept. of Math., Nat. Univ. of Singapore, Singapore).

J. Math. & Phys. Sci. (India), vol.16, no.5, p.415-30 (Oct. 1982). [received: May 1983]

The authors consider the problem of modelling and analysing systems driven by discontinuous Markov processes. The purely discontinuous Markov process of Feller-Kolmogorov type is described and its associated stochastic integral studied. Then a stochastic model of a dynamical system driven by such a process is presented. (18 refs.)

74378 Kinetic simulation of an aggregation process. C. Allain, B. Joughier (Lab. d'Hydrodynamique et de Mécanique Phys., ESPCI, Paris, France).

J. Phys. Lett. (France), vol.44, no.11, p.421-8 (1 June 1983). In French.

An experimental simulation in two dimensions has permitted the authors to study the growth of clusters during an aggregation process. The existence of a critical surface fraction and of self-similar geometrical properties of the cluster is demonstrated. (12 refs.)

74379 An analysis of Smoluchowski equation for sedimentation. H. Minowa (Phys. Dept., Numazu Nat. Coll. of Technol., Numazu-shi, Shizuoka, Japan).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.3, p.99-104 (21 May 1983).

As an example of the theoretical analysis of the Smoluchowski equation, (S eq.), the collective motion of Brownian particles in sedimentation is studied here exactly. First, using the standard procedures the authors show that the general solution of the S eq., which is satisfied with some given boundary and initial conditions, can be expressed as a series expansion by a complete set of orthogonal functions. Next, letting the region tend to infinity, they reduce the solution in series form to an asymptotic solution in integral form. Further they prove that execution of the integration just results in the formula described in Chandrasekhar's review (1943). Nowadays, the Brownian motion under external force-field has become a big target of active research. The analysis given here is partially original and useful as a tool to solve the problems related to this motion such as the sedimentation, the surface kinetics of absorption or desorption, and the diffusion phenomena etc. (13 refs.)

74380 Two limit theorems for ergodically regenerated stochastic processes. J. Kupka (Monash Univ., Clayton, Victoria, Australia).

Math. Proc. Cambridge Philos. Soc. (GB), vol.93, pt.3, p.519-36 (May 1983).

There is a suitable difference between the recurrent event of Feller (1968) and the regenerative phenomenon of Kingman (1964). The former regenerates an entire ambient process, whereas the latter regenerates only itself. The author generalizes Feller's definition to a discrete regenerative phenomenon E in association with an arbitrary discrete-time stochastic process X . Two limit theorems of a general character are proved for the process X when it is regenerated by an ergodic phenomenon E . The first implies that X becomes strictly stationary at a uniform rate which is determined solely by the asymptotic behaviour of E . The second is essentially a mixing convergence theorem which implies the asymptotic independence of regenerating and regenerated events. Applications include (1) the outright independence of the regenerating events and the regenerated events which occur 'at the end of time', and (2) the identification of the transient features of X with the null sets of the stationary limiting probability. Numerous open questions are posed. (20 refs.)

74381 Hamiltonian model for the Brownian motion of a rigid rotor. K. Lindenberg, U. Kohanty (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA), V. Seshadri.

Physica A (Netherlands), vol.119A, no.1-2, p.1-16 (April 1983).

The authors derive stochastic equations for the motion of a rigid rotor in a linear heat bath starting from a fully dynamical (Hamiltonian) description. They obtain a generalized Langevin equation for the angular velocity of the rotor in which the fluctuations in the torque arise from the initial conditions of the heat bath. The dissipation is in general nonlinear and is related to the fluctuations via a fluctuation-dissipation relation that is a natural consequence of our description. In the Langevin limit we show that our equations are equivalent to the phenomenological Euler-Langevin equations. However, whereas the latter are necessarily expressed in components referred to a body-fixed coordinate system, our representation is valid in an arbitrary system of axes and is in that sense more general. Finally, we also examine the reduction of our model to the rotational diffusion equation in the high viscosity limit. We show that this reduction can be carried out via standard methods of adiabatic elimination if our representation of the rotor equations of motion is used. (26 refs.)

74382 Systematic elimination of fast variables in linear systems. U. Geigenmüller, U.M. Titulaer, B.U. Felderhof (Inst. für Theoretische Phys. A, RWTH Aachen, Aachen, Germany).

Physica A (Netherlands), vol.119A, no.1-2, p.41-52 (April 1983).

The authors consider linear systems in which some of the variables evolve on a much faster time scale than the remaining ones. By means of a systematic perturbation theory in the time-scale ratio they extract a reduced dynamics in terms of the slow variables only, valid after an initial transient period. The procedure provides a systematic extension of the usual adiabatic elimination scheme and gives corrections to it. They also find an expression for the long-time behavior of the correlation functions of the slow variables. These asymptotic expressions do not extrapolate back towards the equal-time correlations for t going to zero: the reason for this 'initial slip' is given and its magnitude calculated. Method and results are illustrated with a simple example of coupled oscillators. (15 refs.)

74383 On Brownian motion in fluids with spin. A.Perez-Madrid, J.M.Rubi, J.Casas-Vazquez (Dept. de Termologia, Univ. Autonoma de Barcelona, Barcelona, Spain).

Physica A (Netherlands), vol.119A, no.1-2, p.212-29 (April 1983).

A method of induced forces and torques is employed to study Brownian motion of a particle in a fluid with internal angular momentum (spin). One derives generalized Faxen theorems for the force and torque exerted on the particle. In the Landau-Lifshitz approach, one obtains fluctuation-dissipation theorems for the force and torque. The results are applied to quinoline and liquid nitrogen. (19 refs.)

74384 Brownian diffusion of a small particle in a suspension. II. Hydrodynamic effect in a random fixed bed. J.-P.Carton (Service de Phys. du Solide et de Resonance Magnetique, CENS, Gif sur Yvette, France), E.Dubois-Violette, J.Prost.

Physica A (Netherlands), vol.119A, no.1-2, p.307-16 (April 1983).

For pt.1 see *Phys. Lett.* vol.86A, p.401 (1981). The Brownian diffusion of a small particle in a fluid flowing through a random fixed bed of identical spheres is considered. To lowest order in the volume fraction ϕ of the suspension, the diffusion constant is shown to be renormalized in the direction transverse to the velocity as $D_{\perp} = D(1 + 3(\phi/2)^{1/2})$ provided the velocity is large enough. (6 refs.)

74385 Asymptotic properties of the Markovian master equations for multi-stationary systems. E.-J.Ding (Dept. of Phys., Liaoning Univ., Shenyang, Liaoning, China).

Physica A (Netherlands), vol.119A, no.1-2, p.317-26 (April 1983).

Asymptotic properties of the Markovian master equations for multi-stationary systems are discussed. It is proved that the convergence radii of the generating functions are greater than one in most cases. On this basis, the singular perturbation expansion method is generalized to include the case of multi-stationary systems beyond the bifurcation point. The properties of stationary states of the system in the thermodynamic limit are discussed, and the implications of multiplicity of states in the properties of the generating function are established. (6 refs.)

74386 On the Brownian motion of deformable particles. A.V.Zatovsky (Dept. of Theoretical Phys., Odessa State Univ., Odessa, USSR), V.Lisy.

Physica A (Netherlands), vol.119A, no.1-2, p.369-79 (April 1983).

The theory of the Brownian motion of deformable particles is presented taking into account the interaction between the rotational motion of the particle and vibrations of its form. The changes of the form of the Brownian particle are described by means of the coordinates used in the collective model of the atomic nuclei. The Einstein-Smoluchowski kinetic equation has been obtained in these coordinates. A canonical transformation of the variables is carried out into the space of the Eulerian angles and two deformation parameters. An approximate solution of the kinetic equation has been found using the new variables for particles which have an axially symmetrical shape in equilibrium. Simple time correlation functions of dynamic variables of the particle are calculated. (14 refs.)

74387 Fokker-Planck equation for a multiplicative stochastic process with a stationary Gaussian noise. J.Iwaniszewski (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland).

Phys. Lett. A (Netherlands), vol.95A, no.8, p.415-18 (23 May 1983).

Starting from a Langevin equation with stationary gaussian noise of arbitrary correlation time, a corresponding Fokker-Planck equation is derived under the condition of small noise strength. (11 refs.)

74388 Critical dimensionality and exponent of the 'true' self-avoiding walk. L.Pietronero (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5887-9 (1 May 1983).

A simple, self-consistent method is formulated to compute the critical dimensionality d_c and the exponent ν of the 'true' self-avoiding walk as defined by Amit et al. (1983). There results $d_c=2$, in agreement with the renormalization analysis. In addition, the author obtains $\nu=2/(2+d)$ for $d<2$. The present method applied to the problem of the self-repelling chain reproduces the Flory exponent. (5 refs.)

74389 Generalized method of optimal identification and optimal estimation of nonlinear dynamical systems. V.V.Bek, V.P.Grigo'ev, A.R.Makhlin, I.S.Ukolov (Sci. Council on Complex Problem 'Cybernetics', Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.589-90 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.827-9 (Aug. 1982). [received: May 1983]

Examines the behavior of a dynamical object described by a stochastic equation of the form $dx/dt = f_1(x,u,t) + f_2(x,u,t)w(t)$. The equation of the measurements is of the form $z(t) = h(x,t) + v(t)$, where x is the n -dimensional extended parameter-and-state vector with the initial condition $x(t_0)$, which is a random vector with mathematical expectation $\mu_0(t_0)$ and covariance C_0 , u is the m -dimensional control vector, z is the r -dimensional measurement vector, $w(t)$ is the p -dimensional perturbation vector, and $v(t)$ is the r -dimensional vector of the random errors in the measurements. 74390 Block spin renormalization group for dipole gas and $(\phi)^4$. K.Gawedzki (IHES, Bures-sur-Yvette, France), A.Kupiainen.

Ann. Phys. (USA), vol.147, no.1, p.198-243 (15 April 1983).

A rigorous, non-perturbative analysis of the block spin (BS) renormalization group is performed for a large class of massless lattice models such as the dipole gas and $(\phi)^4$. Effective Hamiltonians are shown to be driven to the line of Gaussian fixed points by iteration of the BS-transformation. Analyticity of the pressure and the dielectric constant in the (weak) coupling is proven. In particular, the perturbative expansion in activity for the dipole gas is convergent. (10 refs.)

74391 Probability estimates for symmetric simple exclusion random walks. A.de Masi, E.Presutti (Istituto Matematico Univ. dell'Aquila, L'Aquila, Italy).

Ann. Inst. Henri Poincaré Sect. B (France), vol.19, no.1, p.71-85 (1983).

Finitely many symmetric random walks in \mathbb{Z} , interacting by simple exclusion are considered. It is assumed that $\sum_{i \in \mathbb{Z}} x_i^2 \rho(x) < \infty$ where $\rho(x)$ is the probability that a single random walk jumps by x . A coupling Q of this process and the corresponding free one (where the exclusion condition is dropped) is established so that $Q(\{|x_i(t) - x_i^{(0)}(t)| \leq t^{1/2} : i = 1, \dots, n\}) \geq 1 - AT^{-\alpha}$ $\alpha > 1/4$ $\gamma < \alpha \beta - 1/2$ $\beta = \sum_{i \in \mathbb{Z}} |x_i|^2 \rho(x) < \infty$ ($\beta \leq 2$) where n is the number of particles, $x_i(t)$ [$x_i^{(0)}(t)$] the position at time t of particle i in the interacting [free] process and A may depend on α , γ and n . (10 refs.)

74392 Statistical theory of the degree of polymerization. Lee Jingde.

Acta Sci. Nat. Univ. Sunyatseni (Zhongshandaxue Xuebao) (China), no.4, p.50-7 (1982). In Chinese.

Introducing the concepts of empty group and empty bond, the degree of polymerization of a molecule can be studied with the Ising model of metastable states, in which the statistical theory on thermal equilibrium can no longer be used. The system is stable when the free energy has a minimum in the appearance of activating agents. For a cyclic chain, since the lower temperature orbit can not reach the representation point of an ordering state in configuration space, then polymerization is impossible. But for a long chain containing N structural units, the theory gives the results that the ceiling temperature $T_c = 2J/k \ln N^{1/2}$. The results are in good agreement with experiments for polymerization and dissociation of polymers. (10 refs.)

74393 'l-relatively atomic and h-relatively atomic lattices'. S.H.Raza (Dept. of Maths., Univ. of Delhi, Delhi, India).

Indian J. Theor. Phys., vol.29, no.3, p.299-303 (Sept. 1981).

The author has obtained various properties of atoms. It is shown that the m -atomistic left complemented lattice is an l -relatively atomic lattice, and that if $p(L)$ is a complete atomic lattice, then $p(L)$ is h -relatively atomic lattice. (3 refs.)

74394 Random-walk theory for localization. M.Chaturvedi (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India), V.Srivastava.

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1463-8 (April 1983).

A continuous-time random-walk theory has been developed for Anderson localization. On a continuous time scale random walks are performed along extended (i.e. propagating) and localized (i.e. trap) states. Complete information of disorder is contained in a distribution function called 'hopping time distribution function' $\psi_{nm}(t)$, which gives the probability per unit time for transition from state m to state n in time t . The 'stay-put' probability $P(t=\infty)$, which is the probability to rediscover an excitation at a site '0' at time $t=\infty$ if it was there at $t=0$, is obtained in terms of $\psi_{nm}(t)$. Appropriate forms for $\psi_{nm}(t)$ are constructed which are in conformity with the photoconductivity experiments on dispersive transport, and $P(\infty)$ are calculated. The results indicate that the entire spectrum consists of three regimes, namely those of (i) 'diffusion', (ii) 'weak diffusion', and (iii) 'no diffusion', which, respectively, designate the extension, the power-law localization, and the exponential localization of states. The results also shed light on the question of 'continuous or discontinuous (?) transition across the mobility edge. (9 refs.)

74395 Effects of topological solitons on autocorrelation functions for chains of coupled torsional oscillators. D.Perechak, R.Yaris, J.Skolnick (Dept. of Chem., Washington Univ., St. Louis, MO, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6914-27 (1 June 1983).

Brownian dynamics computer simulations were performed on chains of coupled torsional oscillators. The purpose was to observe the changes in autocorrelation functions, related to typical experimental measurements, caused by the introduction of topological solitons or kinks into the system. The authors considered three model systems: a chain of coupled torsional oscillators, a chain of coupled torsional oscillators with additional onefold rotational potentials acting on each oscillator, and a chain of coupled torsional oscillators with additional threefold rotational potentials. These models are of interest because of their application to torsional motions in polymeric systems, and, in particular, the system with onefold rotational potentials has been studied extensively as the sine-Gordon chain. They present simulation results for three autocorrelation functions of these three systems both with and without topological solitons. (26 refs.)

74396 Attenuation of fluctuations by an external field in a correlated walk. S.V.Godoy (Univ. Autonoma Metropolitana-Iztapalapa, Mexico City, Mexico).

J. Chem. Phys. (USA), vol.78, no.11, p.6940-6 (1 June 1983).

Correlated walk in the presence of an external field is applied to the study of diffusion coefficients in simple cubic lattices. A continuous time distribution is introduced with the aid of the pausing time distribution developed by Montroll (1965). An exact expression for the diffusion coefficient is derived for perfect cubic lattices. It is found that the external field attenuates the effects of the RMS deviations. These results are used to discuss the atomic diffusion in cubic lattices with impurities, which act as traps. Comparison with previous experimental and theoretical results is made and discussed. (14 refs.)

74397 Metastable states near the phase boundary: a finite-lattice study. C.J.Hamer (Dept. of Appl. Math. & Theoretical Phys., Univ. of Liverpool, Liverpool, England). *J. Phys. A (GB)*, vol.16, no.6, p.1247-55 (21 April 1983). The energy of the metastable vacuum in a complex magnetic field has been computed for the Hamiltonian field theory version of the Ising model in (1+1)D, using finite-lattice methods. Evidence is found for an essential singularity at the phase boundary, as predicted by the droplet model. (16 refs.)

74398 Finite-size scaling in the (2+1)D Ising model. C.J.Hamer (Dept. of Appl. Math. & Theoretical Phys., Univ. of Liverpool, Liverpool, England). *J. Phys. A (GB)*, vol.16, no.6, p.1257-66 (21 April 1983). Hamiltonian eigenvalues are calculated for the (2+1)D Ising model on lattices up to 5X5 sites. Finite-size scaling techniques are used to estimate the critical coupling $x_c=0.329\pm0.001$, and index $\nu=0.635\pm0.005$. The prospects are discussed for further applications of these methods in three and four dimensions. (29 refs.)

74399 High-temperature differentiability of lattice Gibbs states by Dobrushin uniqueness techniques. C.Prakash (Dept. of Math., Univ. of California, Irvine, CA, USA). *J. Stat. Phys. (USA)*, vol.31, no.1, p.169-228 (April 1983). The author establishes conditions for the differentiability, to any order, of the Gibbs states of classical lattice systems with arbitrary compact single-spin space and with interactions in the Dobrushin uniqueness region. The derivatives are expressed as series expansions and are shown to be continuous on the uniqueness region. The author also provides a procedure for estimating the size of the derivatives. These results verify a conjecture of L. Gross and extend his results (1981). (27 refs.)

74400 The Coxeter-Todd lattice the Mitchell group and related sphere packings. J.H.Conway (Univ. of Cambridge, Cambridge, England), N.J.A.Sloane. *Math. Proc. Cambridge Philos. Soc. (GB)*, vol.93, pt.3, p.421-40 (May 1983). The authors study the Coxeter-Todd lattice Λ_6^* , its automorphism group (which is Mitchell's reflection group 6.PSU(4,3).2), and the associated 12-dimensional real lattice K_{12} . They give several constructions for Λ_6^* , which is a $Z[\omega]$ -lattice where $\omega=e^{2\pi i/3}$; enumerate the congruence classes of $\Lambda_6^*/2\Lambda_6^*$ and $\Lambda_6^*/\theta\Lambda_6^*$, where $\theta=\omega-\bar{\omega}$; prove the lattice is unique; determine its covering radius and deep holes; and study its connections with the lattice E_6 and the Leech lattice. A number of new dense lattices in dimensions up to about 10^7 are constructed. They also given an explicit basis for the invariants of the Mitchell group. They conclude with an extensive bibliography. (61 refs.)

74401 Phase transitions for the Ising model on the closed Cayley tree. J.E.Krizan, P.F.Barth (Dept. of Phys., Univ. of Vermont, Burlington, VT, USA), M.L.Glasser. *Physica A (Netherlands)*, vol.119A, no.1-2, p.230-42 (April 1983). The closed Cayley tree with the Ising model which was defined by Jellitto for a branching ratio of two is here generalized to an arbitrary branching ratio. The occurrence of a discontinuity in the spin-spin correlation functions is demonstrated and the free energy is obtained. The topology of the network, with its interesting correlation results makes the model a candidate for further investigation. (10 refs.)

74402 Bond percolation on the square lattice: anisotropic systems. A.R.McGurn (Dept. of Phys., Western Michigan Univ., Kalamazoo, MI, USA). *Physica A (Netherlands)*, vol.119A, no.1-2, p.295-306 (April 1983). Bond percolation on the square lattice in which horizontal and vertical bonds can have different occupation probabilities is studied within the context of annealed model solutions for the zero-temperature bond-diluted Ising ferromagnet. The percolation probabilities and pair-connectedness functions for this percolation are obtained in terms of the concentration of horizontal and vertical bonds in the system. Also, the critical behavior of these properties near the critical bond concentrations is determined. The neutron scattering from the annealed isotropic bond-diluted Ising ferromagnet is then studied in bond concentration (percolation) and temperature variables near the critical bond concentration point. Comparison of the crossover from thermal to percolative behavior is made with recent experiments by Cowley et al. (1970) on $Rb_2Co_2Mg_{1-x}F_x$. Finally, certain exact results for anisotropic plaquette percolation on the square lattice are presented. (12 refs.)

74403 Connectivity constant of the kagome lattice. K.Bhadra, C.K.Majumdar (Phys. Dept., Calcutta Univ., Calcutta, India). *Pramana (India)*, vol.20, no.1, p.73-5 (Jan. 1983). [received: May 1983] From the computation of self-avoiding walks on the kagome lattice, its connectivity constant is found to be 2.569 ± 0.008 . (12 refs.)

74404 Probability density function of the double-Gaussian model. P.D.Beale (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5804-6 (1 May 1983). An exact factorization of the partition function of the double-Gaussian model into Gaussian and Ising components is exploited to derive an exact factorization of the block probability density function. The block probability density function factors into a Gaussian, which describes the phonons in the problem, and a block probability density function of a long-ranged Ising model. This quantity is shown to be consistent with scaling assumptions near criticality. As long as the correlation length and the block size are much larger than the phonon correlation length, the scaling assumptions are satisfied. (7 refs.)

74405 Comment on 'Canonical-ensemble results for the Ising model with random bonds in two dimensions. K.Binder (Inst. fur Festkörperforschung, Kernforschungsanlage Jülich, Jülich, Germany), I.Morgenstern. *Phys. Rev. B (USA)*, vol.27, no.9, p.5826-8 (1 May 1983). In numerical calculations of a quantity $A(T)=\partial \ln X_{EA}/\partial T$, where $X_{EA}=\sum \langle \sigma_i \sigma_j \rangle$, for finite LxL Edwards-Anderson (EA) models, Fernandez [Phys. Rev. B25, 417 (1982)] finds that $A(T)$ has a peak at $T_0\approx 0.6$ (Gaussian model) or $T_0\approx 1.0$, for $L=4, 6, 8, 10$, or 11, respectively. He finds that the peak height $\lambda_{max}=A(T_0)$ increases in direct proportion to L , and interprets his results in terms of a phase transition at T_0 , where the correlation length $\xi_{EA}\propto (T-T_0)^{-1}$. This conclusion is in disagreement with the authors' previous findings that ξ_{EA} is finite in this temperature range, although a (dynamic) 'freezing transition' of the spins occurs at $T_f\approx 1.0$ (Gaussian model) or $T_f\approx 1.3$ ($\pm J$ model), which lead us to suggest that the two-dimensional EA model has a phase transition at zero temperature only. (4 refs.)

74406 Reply to 'Comment on "Canonical-ensemble results for the Ising model with random bonds in two dimensions".' J.F.Fernandez (Centro de Física, Inst. Venezolano Investigaciones Científicas, Caracas, Venezuela). *Phys. Rev. B (USA)*, vol.27, no.9, p.5829-30 (1 May 1983). In the previous Comment, (see *ibid.*, vol.27, p.5826, 1983), Binder and Morgenstern use their previous result, $\langle S_i S_j \rangle^2 = c \exp(-r_{ij}/\xi)$ for small systems, plus their hypothesis that ξ and c depend weakly on L , to produce results

strongly similar to what the author has obtained previously (see *ibid.*, vol.25, p.417, 1982). They thus suggest that results, contrary to his own conclusion, do not indicate the existence of a critical point in the Edwards-Anderson model in two dimensions. He shows here that their claim is not well founded. (3 refs.)

74407 Renormalization groups for two- and three-dimensional kinetic Ising models. F.Haake, M.Lewenstein (Fachbereich Phys., Univ. Essen-Gesamthochschule, Essen, Germany). *Phys. Rev. B (USA)*, vol.27, no.9, p.5868-71 (1 May 1983). Presents a renormalization group for kinetic Ising models. Recursion relations for flip rates are established through double series in powers of the inverse temperature and a self-consistently determined time-scale ratio. A static transformation is obtained as a subset of recursion relations in which only the inverse temperature appears as expansion parameter. The best second-order value for $d=2$ is $z=2.2$ (with an uncertainty of roughly 10%), while for the simple cubic lattice in $d=3$ the authors find $z=1.98$ if T_c is adjusted to the known numerical value. (8 refs.)

74408 Phenomenological renormalization and scaling fields. M.N.Barber (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5879-82 (1 May 1983). Two methods of obtaining the linear scaling fields and related exponents from a phenomenological renormalization group on a multiparameter system are presented. The methods are illustrated by application to the Baxter-Wu (triplet) and the anisotropic Ising models, yielding excellent agreement with all exact or conjectured results. (18 refs.)

05.60 TRANSPORT PROCESSES: THEORY

74409 The Boltzmann equation theory of charged particle transport. D.R.A.McMahon (Res. School of Phys. Sci., Austrian Nat. Univ., Canberra, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.2, p.163-83 (1983). It is shown how a formally exact Kubo-like response theory equivalent to the Boltzmann equation theory of charged particle transport can be constructed. The author's response theory gives the general wavevector and time-dependent velocity distribution at any time in terms of an initial distribution function, to which is added the 'response' induced by a generalized 'perturbation' over the intervening time. The usual Kubo linear response result for the distribution function is recovered by choosing the initial velocity distribution to be Maxwellian. For completeness the response theory introduces an exponential convergence function into the 'response' time integral. This is equivalent to using a modified Boltzmann equation but the general form of the transport theory is not changed. The modified transport theory can be used to advantage where possible convergence difficulties occur in numerical solutions of the Boltzmann equation. The paper gives a systematic development of the modified transport theory and shows how the author's response theory fits into the broader scheme of solving the Boltzmann equation. (30 refs.)

74410 Identification of the polyrelaxational nonlinear differential mass diffusion operator. A.G.Temkin (Polytech. Inst., Riga, USSR). *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.741-5 (May 1983). Diffusion in a non-homogeneous mixture is described by a polyrelaxational equation involving the diffusion coefficient which depends on concentration and several physical parameters. A set of the relaxation time spectra and diffusion coefficients (as functions of concentration) form a polyrelaxational nonlinear differential operator of mass diffusion. The method presented for the identification of this operator consists of the experimental determination of the relaxation time spectrum and of all the diffusion coefficient parameters. As initial information, the time derivative of the mass moment of the diffusing substance, and a substantially nonhomogeneous initial distribution of concentrations in an insulated rod of any shape but constant cross section, are used. (5 refs.)

74411 One-dimensional Boltzmann equation with a three-body collision term. Shang-keng Ma (Dept. of Phys., Univ. of California, San Diego, La Jolla, CA, USA). *J. Stat. Phys. (USA)*, vol.31, no.1, p.107-14 (April 1983). It is shown that a linearized one-dimensional Boltzmann equation with a certain simple three-body collision term is trivially soluble. (5 refs.)

74412 On the higher derivatives of the H-function for a model Boltzmann equation. J.O.Vigfusson (Inst. fur Theoretische Phys., Univ. Zurich, Zurich, Switzerland). *Physica A (Netherlands)*, vol.119A, no.1-2, p.380-6 (April 1983). It is shown that, contrary to the current belief, the H-function for a discrete Boltzmann equation model in general does not satisfy the condition $(-1)^d d^d H/dt^d \geq 0$. (18 refs.)

74413 On the solution of the Fokker-Planck equation for Brownian movement in a one-dimensional periodic potential. W.T.Coffey (School of Engng., Trinity Coll., Dublin, Ireland), P.Grignolini, P.Marin. *Proc. R. Ir. Acad. Sect. A (Ireland)*, vol.82A, no.2, p.167-76 (Dec. 1982). [received: May 1983] The Fokker-Planck equation for the Brownian movement in a potential (commonly called the Kramers equation) has considerable application in (a) the diffusion of charge carriers, in semiconductors, (b) the Josephson tunnelling junction, (c) chemical reaction rates, (d) superionic conductors and (e) dielectric relaxation of dipoles with dipole-dipole interaction. In this paper it is shown how the problem of solving the Kramers equation (and hence calculating the number density of the diffusing particles) may be reduced to that of solving a set of differential-difference equations in the time domain only. A numerical solution of these equations is presented, and several ensemble averages are calculated. These show clearly the non-Gaussian behaviour of the distribution function. (14 refs.)

- 74414 Statistical thermodynamics of turbulent transport processes.** D.N.Zubarev (V.A. Steklov Math. Inst., Acad. of Sci., USSR). *Theor. & Math. Phys. (USA)*, vol.53, no.1, p.1004-14 (Oct. 1982). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.93-107 (Oct. 1982). The method of nonequilibrium statistical thermodynamics is applied to the theory of transport processes in a liquid in the presence of strong fluctuations. The distribution functional of the densities of the momentum, energy, and particle number satisfies a Fokker-Planck equation and determines the entropy of a state with strong fluctuations. This makes it possible to obtain not only a hierarchy of Reynolds equations but also an entropy production that gives expression to the second law of thermodynamics. (22 refs.)
- 74415 Nonequilibrium statistical thermodynamics of two diffusion processes: diffusion dechanneling of particles and diffusion migration of light impurities. II. 'Quasichemical reaction'.** Yu.A.Kashlev (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR). *Theor. & Math. Phys. (USA)*, vol.53, no.1, p.1029-34 (Oct. 1982). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.129-37 (Oct. 1982). For pt.I see *ibid.*, vol.51, p.289 (1982). Two typical diffusion processes—diffusion dechanneling of particles and diffusion migration of light impurities—are treated as a single 'quasichemical reaction'. The kinetic laws of this reaction are discussed. (27 refs.)

05.70 THERMODYNAMICS

(see also 44.60 Thermodynamic processes, 64. Equations of state, phase equilibria and phase transitions, 65. Thermal properties of condensed matter; for chemical thermodynamics, see 82.60)

- 74416 Thermodynamics based on the Hahn-Banach theorem: the Clausius inequality.** M.Feinberg (Dept. of Chem. Engng., Univ. of Rochester, Rochester, NY, USA), R.Lavine. *Arch. Ration. Mech. & Anal. (Germany)*, vol.82, no.3, p.203-93 (1983). The authors' immediate concern is not with the Clausius-Duhem inequality in its full generality but rather with the form it takes for cyclic processes. This more limited statement, called the Clausius inequality, is usually deemed to be a logical precursor of the Clausius-Duhem inequality. They believe that most, if not all, special theories based upon consideration of cyclic processes share features which, when suitably abstracted, permit analysis of those theories within a common framework. In the spirit of work by Coleman and Owen (1974) they seek to develop a 'theory of theories' which, for example, makes possible isolation of precisely those attributes a particular theory must have so that within its framework one or another of the two statements takes on validity. They are especially interested in separating those aspects of the Clausius inequality that depend only on the force of the Second Law from those that depend upon additional structure that might or might not be present within a given theory. (31 refs.)
- 74417 A justification for the scaling of the Thom-system.** Liu Jian-min, Gong Chang-de (Dept. of Phys., Nanking Univ., Nanking, China). *Commun. Theor. Phys. (China)*, vol.1, no.4, p.405-12 (1982). Discusses the critical behavior Thom-system using catastrophe theory. The universal critical asymptotic form of the family of free energy functions for Thom-system with one order parameter and two field parameters is obtained. The expressions for critical exponents, the scaling laws, and the scaling hypotheses are all derived from this universal asymptotic form. (17 refs.)
- 74418 Large numbers hypothesis. III. Kinetic theory, statistical physics, and thermodynamics.** P.J.Adams (Phys. Dept., Univ. of Puget Sound, Tacoma, WA, USA). *Int. J. Theor. Phys. (USA)*, vol.22, no.5, p.437-60 (May 1983). For pt.II see *ibid.*, vol.22, no.5, p.421 (1983). Dirac's large numbers hypothesis (LNH) is incorporated into kinetic theory, statistical physics, and thermodynamics using the self-consistent formalism of units covariance. The incohesive equation and matter creation introduce modifications of the most fundamental laws of the subject. Liouville's theorem no longer holds, and the Boltzmann equation is modified, as is the *H*-theorem. This affects the second law of thermodynamics in that for canonical LNH neither reversible nor adiabatic processes are possible (as expected). A significant result is that the collision terms have the same form as in standard physics. This means that equilibrium distribution functions are identical to those of standard physics, as required for self-consistency with the precepts of LNH. The net effect of LNH is as though all matter in the Universe were weakly coupled to a large heat bath. (10 refs.)
- 74419 Some maximal thermodynamic efficiencies for the conversion of blackbody radiation.** P.T.Landsberg (Dept. of Electrical Engng., Univ. of Florida, Gainesville, FL, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2841-3 (May 1983). Two efficiency formulas are derived for the conversion of blackbody radiation and their relationship is briefly discussed. It enables one to give an analytical expression for the entropy generation rate obtained previously by microscopic considerations. (7 refs.)
- 74420 Relationship of the virial series to vapor condensation and the liquid state.** A.J.Yang, I.Pavlin, J.H.Gibbs (Dept. of Chem., Amherst Coll., Amherst, MA, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.7005-6 (1 June 1983). Recent work, with Mayer's form for the canonical ensemble partition function *Q* for a system of *N* particles in volume *V* at temperature *T*, has yielded a mean cluster size distribution $\{n_i\}$ displaying a bimodality which arises first at the spinodal value for the density $\rho = N/V$. One might assume that discovery and use of correct volume-dependent cluster integrals $b_i(V)$, in place of $b_i(\infty)$ previously used, is all that is required to lower this first appearance of bimodality to the coexistence pressure. The authors adopt an alternative point of view and pressures that the equation for *Q* is subject to the same implicit

assumption of density homogeneity as, e.g., mean field theories, and that therefore it too requires generalization along the lines prescribed by van Hove. (8 refs.)

- 74421 Self adjusting grid methods for one-dimensional hyperbolic conservation laws.** A.Harten (School of Math. Sci., Tel-Aviv Univ., Tel-Aviv, Israel), J.M.Hyman. *J. Comput. Phys. (USA)*, vol.50, no.2, p.235-69 (May 1983). It is shown how to automatically adjust the grid to follow the dynamics of the numerical solution of hyperbolic conservation laws. The grid motion is determined by averaging the local characteristic velocities of the equations with respect to the amplitudes of the signals. The resulting algorithm is a simple extension of many currently popular Godunov-type methods. Computer codes using one of these methods can be easily modified to add the moving mesh as an option. Numerical examples are given that illustrate the improved accuracy of Godunov's (1959) and Roe's (1982) methods on a self-adjusting mesh. (14 refs.)
- 74422 The approximate nature of the Onsager-Casimir reciprocal relations.** U.Geigenmuller, U.M.Titulaer, B.U.Felderhof (Inst. fur Theoretische Phys. A, RWTH Aachen, Aachen, Germany). *Physica A (Netherlands)*, vol.119A, no.1-2, p.53-66 (April 1983). The authors study thermodynamic systems near equilibrium described by both slow and fast variables. A reduced relaxation matrix for the slow variables can be obtained from the full relaxation matrix by a systematic elimination of the fast variables. When the full-relaxation matrix possesses Onsager-Casimir symmetry, the reduced matrix has contributions that violate this symmetry. For a sensible choice of the variables they are in general of second order in the time-scale ratio relative to the dominant terms. The occurrence of such a symmetry violation is demonstrated for a simple example. The symmetry violation is related to initial slip in the correlation functions on the reduced level of description. They discuss a way to salvage the Onsager-Casimir relations by an appropriate modification of the thermodynamic potential, or rather of an associated function similar to the Lagrangian in mechanics. (10 refs.)
- 74423 Intrinsic randomness and intrinsic irreversibility in classical dynamical systems.** M.Courbage, I.Prigogine (Faculte des Sci., Univ. Libre de Bruxelles, Brussels, Belgium). *Proc. Natl. Acad. Sci. USA*, vol.80, no.8, p.2412-16 (April 1983). The authors continue their previous work (see *Physica* vol.98A, p.1-26, 1979) on dynamic 'intrinsically random' systems for which they can derive dissipative Markov processes through a one-to-one change of representation. For these systems, the unitary group of evolution can be transformed in this way into two distinct Markov processes leading to equilibrium for either $t \rightarrow +\infty$ or $t \rightarrow -\infty$. To lift the degeneracy, the authors first formulate the second principle as a selection rule that is meaningful in intrinsically random systems. For these systems, this excludes a set of unrealizable states. As a result of this exclusion, permitted initial conditions correspond to a set of states that is not invariant through velocity inversion. In this way, the time-reversal symmetry of dynamics is broken and these systems acquire a new feature one may call 'intrinsic irreversibility'. The set of admitted initial conditions can be characterized by an entropy displaying the amount of information necessary for their preparation. The initial conditions selected by the second law correspond to a finite amount of information, while the initial conditions that are rejected correspond to an infinite amount of information and are therefore 'impossible'. The authors believe that their formulation permits a microscopic formulation of the second law of thermodynamics for well-defined classes of dynamical systems. (11 refs.)
- 74424 On information, negentropy and thermostatics.** C.G.Chakrabarti (Dept. of Appl. Math., Univ. of Calcutta, Calcutta, India). *Pramana (India)*, vol.20, no.1, p.65-72 (Jan. 1983). [received: May 1983] The interrelation between some basic concepts of information, theory and thermodynamics has been studied on the basis of the statistical measures of entropy and information. The problems studied are the negentropy principle of information, a minimax information principle of thermal equilibrium and the role of information correlation in the derivation of a functional equation characterising the statistical equilibrium of a system. (30 refs.)
- 74425 Equilibrium phase interfaces.** L.M.Trushkinovskii (V.I. Vernadskii Inst. of Geochem. & Analytical Chem., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.551-3 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.306-10 (July 1982). [received: April 1983] The author obtains the complete set of conditions at a moving front of an equilibrium phase transition in a heat-conducting, nonlinearly elastic medium. To the usual conditions of continuity of the fluxes of mass, momentum, and energy, he adds a relation which is a generalization of the well known condition of continuity of the chemical potential and serves for determining the velocity of the front. The structure of the discontinuity is constructed on the basis of the nonlocal equation of state. (10 refs.)

A new definition of a meter by the International Bureau for Weights and Measures (BIPM) Consultative Committee for the Definition of Meter (CCDM) based on the exact value of the speed of light (299,792,458 m/sec) is analysed. A detailed analysis of light propagation speed aspects is given arguing that identical concepts are used for other physical quantities, e.g. candle in the international system of units. Effects on other constants used (Avagardo, Planck, Boltzmann, etc.) are considered, arguing that a meter is defined as a unit of length, not a distance. Conceptual expansion to a distance would cause more profound conceptual changes. (no refs.) *T.H.*

06.30 MEASUREMENT OF BASIC VARIABLES

- 74430** On the sensitive and wide frequency range measurement of pressure. Y.Tanaka (Dept. of Appl. Mech., Okayama Univ., Okayama City, Japan), M.Masuda, Y.Shimamoto. *Bull. JSME (Japan)*, vol.26, no.213, p.364-71 (March 1983).
The authors present analysing methods of the response characteristics necessary for designing a miniature pressure detector of capacitance type and electronic methods for realizing a sensitive and wide-band measurement of pressure. Several detectors, a transducer and an amplifier are prepared with the object of examining the adaptability and practicality of these methods. Dynamic measurement and static comparative test between the present device and other high-sensitive pressure measuring methods show that the analysis can well express the detector response to pressure and that the present method enables measurements more sensitive than the resolution of 0.002 mmAq (0.02 Pa). 06.30C Spatial variables measurement

- (inc. measurement of all variables extending in space e.g. diameter, height, thickness, displacement, surface topography, particle size, area of disperse systems)*
- 74431** Linear capacitive microdisplacement transduction using phase read-out. K.B.Klaassen, J.C.L.van Peppen (Dept. of Electrical Engng, Delft Univ. of Technol., Delft, Netherlands). *Sens. & Actuators (Switzerland)*, vol.3, no.3, p.209-20 (May 1983).
Describes a principle for capacitive transduction of microdisplacements. Transducers based on this principle achieve a fixed, built-in sensitivity which

is determined only by the transducer's electrode geometry. This geometry can be manufactured accurately by photolithographic processes. The principle renders the transducer immune to small movements in directions other than the main sensitivity axis and to a small rotation and tilt of the electrode planes. The transducers require only one active electrode plane to which wires must be connected. A realization of the principle in thin-film technology is described. This transducer achieves a resolution better than 25 nm, a measurement span of about 1 cm and a non-linearity smaller than 2 μ m peak deviation from linear. A large-scale printed-circuit board realization with an improved electrode geometry results in even better specifications when the scale factor is taken into account. (6 refs.)

- 74432** Piezoelectric subdivision method of multiple-beam interference for flatness measurement. Chien Shih-nan (Anhui Inst. of Optics & Fine Mech., Acad. of Sci., Peking, China). *Chin. J. Sci. Instrum. (China)*, vol.4, no.1, p.3-8 (Feb. 1983). In Chinese.
The flatness of a precise plane is generally measured by making use of fringes of equal thickness. A piezoelectric subdivision method of multiple-beam interference is described using a group of reference fringes. The original gap between two adjacent fringes is a, and the gap between the new reference fringe and the original one should be a/m. The flatness is tested by direct observation or photography by making use of a/m as a standard. (4 refs.)

- 74433** Cryogenic liquid level monitor using a frequency to voltage converter. S.J.Collocott (CSIRO Div. of Appl. Phys., Sydney, NSW, Australia). *Cryogenics (GB)*, vol.23, no.6, p.327-8 (June 1983).
A simple cryogenic liquid level monitor based on a frequency-to-voltage converter is described. The monitor is simple to construct and its design obviates the need for special techniques to eliminate the effects of stray capacitance. It has excellent linearity, high sensitivity, and uses a simple two-terminal capacitance probe. (5 refs.)

- 74434** Objective laser speckle method for 3-D displacement measurement on curved surfaces. C.C.Kin, F.P.Chiang (Dept. of Mech. Engng., State Univ. of New York, Stony Brook, NY, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.335, p.54-8 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).
By illuminating a ground glass with a laser beam, a spatial field of speckles is created. These speckles are used as displacement gauging elements of curved 3-D objects whose surfaces are coated with photosensitive material. Equations are derived to show that all the three components of the surface displacement can be obtained from two specklegrams. (6 refs.)

- 74435** Image analysis on the cheap [microcomputer application]. J.Rodgers (Lombardy Sci. Ltd., Berkhamsted, England). *Lab. Microcomput. (GB)*, vol.1, no.1, p.15-19 (Spring 1982).
Describes how an Apple microcomputer and its 'Graphics Tablet' bit pad can be used to determine particle size distributions from micrographs. In the method particle shapes are digitised on the bit pad and standard software is used to calculate the particle size and compute the statistics. (no refs.)

- 74436** Laser interference method of measuring small taper angles in plates in the IR range. V.S.Sollogub. *Meas. Tech. (USA)*, vol.25, no.9, p.725-8 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.16-18 (Sept. 1982). [received: May 1983]
The proposed method employs a collimated laser beam which passes through the test plate perpendicular to the surface, and a receiving device which measures the relative change in radiation power after passage through the plate. A characteristic feature of the method is that the plate is rotated slowly (deflected through a small angle) relative to the direction of the laser beam, e.g. with a screw rotation mechanism. One observes the changes in the transmission coefficient due to interference. One reads the output of the detecting device corresponding to extremal values of the transmission coefficient T_{max}, T_{min}; then the ratio T_{max}/T_{min} is used to determine the taper angle from a graph. The angle of deviation of the plate and the sense of the deviation play no part. (6 refs.)

- 74437** 3-D measurement by using a multiplex hologram. K.Okada, T.Honda, J.Tsujuchi (Imaging Sci. & Engng. Lab., Tokyo Inst. of Technol., Yokohama, Japan). *Opt. Commun. (Netherlands)*, vol.45, no.5, p.320-2 (1 May 1983).
A method for measuring three dimensional position by using a multiplex hologram is proposed with some examples of measurements. (8 refs.)

- 74438** Cantilever and capacitor technique for measuring dilatation. W.Primak, E.Monahan (Solid State Sci. Div., Argonne Nat. Lab., Argonne, IL, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.5, p.544-51 (May 1983).
The relationship of EerNisse's technique for measuring small dilatations caused by irradiation with short-range particles, which utilizes a metallized thin plate mounted as a cantilever below whose free end an electrode is placed (forming a capacitor), to a photoelastic technique and to an interferometric technique are derived. The effects of stray capacitance, the fringing field of the capacitor, the clamping stress on the cantilever plate, the electrical resistance of the metallic coating, the charging of the tank circuit of which the capacitor is an element, the flange bolting stress, and the beam heating are assessed, and examples of the manner in which they contaminate the data are given. (13 refs.)

- 74439** Accurate in situ measurement of near-surface volume dilatation in irradiated silica through capacitance monitoring of cantilever deflection. C.B.Norris (Sandia Nat. Labs., Albuquerque, NM, USA), E.P.EerNisse. *Rev. Sci. Instrum. (USA)*, vol.54, no.5, p.552-8 (May 1983).
Irradiating a solid with short-range particles often induces a net volume change in the range zone which results in a shallow layer of stressed material. Micron-depth volume dilatations in the part-per-million range can be studied using cantilever mounting of a long, thin, metallized specimen, whose stress-induced bending perturbs the capacitance between the cantilever and a small counterelectrode mounted close to the unirradiated face. This approach has been used successfully by many workers for more than 20 yrs. Elsewhere the authors have reported the construction of a highly sensitive cantilever/capacitor apparatus and its application in the first accurate measurements of ionization dilatation phenomena in fused silica and grown SiO₂ at low electron energies. In this paper they outline key details of apparatus design and experimental technique for successful cantilever/capacitor work. Many contrasts with the work of Primak and Monahan [Rev. Sci. Instrum. 54, 544 (1983), preceding paper] are pointed out. The authors also highlight previous short-term annealing results which make it clear that the compaction of silica will appear to be significantly less in optical measurements made hours after irradiation than in cantilever/capacitor measurements made minutes after irradiation. (19 refs.)

74440 Operating experience with the type UT-80B electromagnetic-acoustic thickness gauge. V.V.Klyuev, S.N.Shubaev, V.F.Muzhitskii (Sci.-Res. Inst. of Introscopy, Moscow, USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.700-5 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.37-43 (Sept. 1982).

The type UT-80B electromagnetic-acoustic thickness gauge is described. The results of its tests and industrial operating experience are presented. (6 refs.)

74441 A family of grating sensors. R.T.Murray (Imperial Chem. Industries, Runcorn, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.114-16

The author has examined a range of optical effects which could be used as the basis of a remote passive sensor with fibre optic links to the control point. In that most control situations require a number of variables to be reported to the intelligent centre it is important that the various sensors and transmission codes be compatible with one another. Conventionally in the industrial scene compatibility is achieved by supplying electrical power to a signal conditioner which then transmits the data as an analogue signal within the standard 4-20 m amp range. If however one attempts to design an optical system in which the sensors are entirely passive this approach is not open to one and the author has therefore obtained compatibility by seeking a universal parameter to which all important measurements can be transduced and which is then used to modulate the optical signal. The simplest quantity to measure optically is displacement to which the major physical variable, pressure, temperature, flow rate and level may readily be transduced. Many techniques exist for measuring displacement optically but for the sake of simplicity the author has chosen to use the properties of a pair of square wave gratings. (6 refs.)

74442 Rugby clock. S.Makumbi.

Electron. Today Int. (GB), vol.11, no.8, p.60-3 (Aug. 1982). [received: May 1983]

Describes a specialised receiver of the type required to demodulate and decode the Rugby time signals. The project clock displays the correct time of day, date, day of week with no need to ever correct it. Even when the signal completely disappears the clock senses this and automatically switches on to its own crystal timebase back-up clock. Included is a comprehensive alarm system comprising eight independent alarms. For each alarm setting there is a choice of a melody, altering the state of eight TTL-compatible lines. (no refs.)

74443 Some remarks on the selection of sensors for correlation velocity measurement systems. R.Massen (Inst. of Sci. & Technol., Konstanz, Germany).

Sens. & Actuators (Switzerland), vol.3, no.3, p.221-31 (May 1983).

Correlation is a very useful tool for measuring time-delays and velocities of moving surfaces and flows. As only the peak position of the sensor signal's cross-correlation function is evaluated, the d.c. parameters of the sensor and the analog preprocessing circuits play only a secondary role. The specific requirements for all sensors used in a correlation measurement system are related to the a.c. signal parameters: bandwidth, differential phase shift, spatial filtering. These requirements are discussed in general terms and a set of practical guide-lines for selecting and optimizing the sensors are presented. Two specific applications are covered. (14 refs.)

74444 A digital-to-digital interface for a laboratory microcomputer: hardware and software. G.H.Vickers, T.O.Trask, J.D.Parli, J.A.Wisman, B.Durham, R.B.Green (Dept. of Chem., Univ. of Arkansas, Fayetteville, AR, USA).

Chem. Biomed. & Environ. Instrum. (USA), vol.12, no.4, p.289-97 (1982-1983).

Describes the design and construction of a digital-to-digital interface for a laboratory microcomputer. In this application, signals from a laser-enhanced ionization experiment are processed with a boxcar signal averager which is interfaced to a Commodore PET 4032 microcomputer. Software has been developed for the microcomputer which performs various operations on the data and prints the values for the average analyte signal, average standard signal, analyte-to-standard ratio, average noise, and analyte signal-to-noise ratio. This interface is also applicable to other laboratory instruments with binary-coded decimal outputs. (6 refs.)

74445 Interfacing and operation of a Princeton Applied Research multi-channel detector controller with a Digital Equipment Corporation DECLA-B-11/MNC computer[spectroscopy application]. P.D.Smith (Biomedical Engng. & Instrumentation Branch, National Inst. of Health, Bethesda, MD, USA), G.W.Liesegang.

Interfaces Comput. (Switzerland), vol.1, no.2, p.161-70 (May 1983).

The hardware and software aspects of an interface between a Princeton Applied Research (PAR) model 1216 Vidicon controller and a Digital Equipment Corporation DECLA-B-11/MNC computer are described; the system is used to control parallel optoelectronic image detectors in spectroscopy. The interface permits complete control of the Vidicon scanning parameters and data gathering. A major advantage over the OMA series offered by PAR is that the computer is not dedicated to control of the Vidicon; its full capabilities are available for additional tasks such as experimental control. (5 refs.)

74446 Nonlinear regression least-squares method for determining relaxation time spectra for processes with first-order kinetics. J.R.Cost (Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2137-46 (May 1983).

A simple method is shown for calculating the relaxation time spectrum which controls the rate at which a process following simple first-order kinetics takes place. The method involves unfolding a Fredholm equation of the first kind using least-squares and then using a modified nonlinear regression rather than a linear least-squares technique, thereby avoiding the highly oscillatory solutions which tend to occur with the latter with reduced mesh spacing or an increased number of bins. The validity and accuracy of the method for analyzing experimental data to reproduce various known input spectra are assessed and found to be excellent for data with no experimental error. For data with simulated experimental error with standard deviations up to $\sigma=0.05$ the method provides acceptable approximate solutions even though no exact solution is expected. Increasing the magnitude of the experimental error for a single lognormal input spectrum appears to have an increasing but nonsystematic affect upon the uncertainty of the approximate solution. Effects due to increasing the number of bins in the interval over which the spectrum is calculated are assessed and shown not to appreciably change the results, even for up to 60 bins. The method is shown to be applicable to a wide variety of input spectra, including single and double lognormal and box distributions. Importantly, in each of the cases studied the approximate solution appeared both to be unique and to converge toward the known input spectrum. Based upon this validation it is concluded that this method has applicability to a wide range of problems in which simple exponential decay is occurring with a spectrum of time constants. It may also be useful for problems with different kernels than that for first order kinetics; however, careful validation will be required. (10 refs.)

06.60 LABORATORY TECHNIQUES

74447 The compensated reciprocating pump model BHB-1 for HPLC. Liu Chi-chia, Yu Yen-ching (Dalian Inst. of Chem. Phys., Acad. of Sci., Peking, China).

Chin. J. Sci. Instrum. (China), vol.4, no.1, p.57-65 (Feb. 1983). In Chinese.

The function, structure and design principle of a compensated reciprocating pump (Model BHB-1) used in liquid chromatography are described in detail. An equation for calculating the cam, the major driving part of the pump, has been derived. The used apparatus is described and the results of the pressure fluctuation and the pump operation are given. (no refs.)

74448 Welding parameter dependence of the shape of the channel formed during electron-beam welding. V.N.Rodigin.

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.646-7 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1127-30 (Aug. 1982). [received: May 1983]

The shape of the vapor channel for electron-beam welding is a central question, since the shape of the channel determines the main parameters of the welded joint—its depth and width. When the beam moves along the surface of the metal, the metal melts at the forward wall of the channel and the molten metal is forced toward the rear wall of the channel. (7 refs.)

06.70 GENERAL INSTRUMENTATION

- 74449 Pd/a-Si:H metal-insulator-semiconductor Schottky barrier diode for hydrogen detection.** A.D'Amico, G.Fortunato, G.Petrocco (Istituto di Elettrotecnica dello Stato Solido, CNR, Roma, Italy), C.Colozza. *Appl. Phys. Lett. (USA)*, vol.42, no.11, p.964-5 (1 June 1983).
- Hydrogenated amorphous silicon (a-Si:H), produced by the glow-discharge technique, has been used to construct very low cost, high quality metal-insulator-semiconductor structures where palladium has been utilized as catalytic metal for hydrogen detection. With this device, hydrogen concentration in hydrogen-nitrogen mixture as low as 100 ppm has been detected. There is indication that the ultimate limit is much lower. (13 refs.)
- 74450 Characteristics of semiconductor gas sensors. I. Steady state gas response.** P.K.Clifford, D.T.Tuma (Electrical Engng. Dept., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
- Sens. & Actuators (Switzerland)*, vol.3, no.3, p.233-54 (May 1983).
- The steady state gas sensing characteristics of SnO₂ gas sensors, as exemplified by the Taguchi Gas Sensor (TGS), are comprehensively studied. Resistance responses to hydrogen, methane, carbon monoxide and water vapor are experimentally characterized, with particular emphasis on multiple gas interactions. The presence of ambient oxygen is essential to the sensor's operation and the detection of combustible or reducing gas is mediated by reaction with adsorbed oxygen to the sensor surface. A quantitative model of device operation is constructed which unifies the diverse properties of the TGS and other semiconductor sensors. The model supplies the mathematical framework for meaningful comparisons of sensor performances of gas sensitivities. In addition, it provides for the intrinsic power law response of sensor electrical resistance to combustible gas concentrations, the competitive and synergistic interactions of several gas detected simultaneously, and the source of sensor unselectivity. (14 refs.)
- 74451 Characteristics of semiconductor gas sensors. II. Transient response to temperature change.** P.K.Clifford, D.T.Tuma (Electrical Engng. Dept., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
- Sens. & Actuators (Switzerland)*, vol.3, no.3, p.255-81 (May 1983).
- For pt.1 see ibid., vol.3, no.3, p.233-54 (May 1983). Temperature-stimulated transient responses of the conductance of SnO₂ gas sensors, as exemplified by the Taguchi Gas Sensor (TGS) are comprehensively studied. These responses are derived at many temperatures for sensors exposed to several fixed concentrations of oxygen in nitrogen. The dynamic response of conductance exhibits complex kinetics characterized by time constants which range, depending on ambient conditions, from seconds to days. Measurement results are analyzed in the light of a proposed model of device behavior. This heuristic model is constructed by combining some fundamental experimental observations with kinetic predictions of the barrier layer theory of absorption. The analyses result in identification of the physical mechanisms responsible for the complex kinetics and long time constants. The authors find that sensor conductance is controlled by an intergranular potential barrier consequent to oxygen absorption. The barrier potential exhibits an Elovich-type rate kinetic and its functional dependences on sensor temperature for several oxygen partial pressures are determined. (28 refs.)
- 74452 Dummy stable bridge source digital strain indicator and the elimination of nonlinear errors.** Chang Yu-liang (Central Coal Mining Res. Inst., China).
- Chin. J. Sci. Instrum. (China)*, vol.4, no.1, p.25-31 (Feb. 1983). In Chinese.
- The dummy stable bridge source digital strain indicator proposed has a great advantage over traditional digital strain indicator. Its features are as follows: nonlinear errors inherent in strain indicator are eliminated; the structure is greatly simplified and the cost is reduced; system parametric errors of the instrument are reduced; the precision of the gage factor can be linearly adjusted to four-digit number by a multiple turn potentiometer, and the value can be read out directly from the dial of the potentiometer or from the display. Nonlinear errors and system parametric errors of both traditional and dummy stable bridge source are analysed in some detail. Nonlinear quantitative analysis of 45 applications is presented. (2 refs.)
- 74453 The design of an amperometric detector for FIA.** Ma Hui-chang Yen, Hui-yu (Inst. of Environmental Chem., Acad. of Sci., Peking, China).
- Chin. J. Sci. Instrum. (China)*, vol.4, no.1, p.44-8 (Feb. 1983). In Chinese.
- A new amperometric flow-through detector applied to flow injection analysis (FIA) and continuous flow analysis is designed. It is composed of an Au tubular working electrode, a stainless-steel tubular counter electrode, and AgCl reference electrode. By using the FIA technique, response is linear for levels from a few tenth of microgram to several milligrams per liter of solution. Analytical rates of 100 samples per hour can be achieved. (7 refs.)
- 74454 Metrological security of strain-gauge measurements in experimental studies.** A.I.Beklemishev, B.S.Dubov, N.P.Klokov, L.I.Kosov.
- Meas. Tech. (USA)*, vol.25, no.9, p.737-41 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.32-5 (Sept. 1982). [received: May 1983]
- Strain-gauge measurements are the principal method of obtaining information in the course of various experimental studies. Strain-gauge systems are widely employed to measure forces, pressures, and displacements as well as to determine the strength of structural designs. These systems include the following elements: tensoresistors or tensoresistive transducers for nonelectrical quantities, measuring arrangement (equipment), and arrangements for recording and processing the information. The tensoresistors serve as primary transducers for determining strains in structures under various conditions in a strength experiment or as intermediate transducers in measuring arrangements. Metrological provisions for the tensoresistors are discussed. (24 refs.)
- 74455 Method of certifying digital transducers for strain gauges with inductive dividers.** M.L.Daichik, V.P.Silaev, A.R.Tsugba, M.M.Lupinski, L.M.Katanov.
- Meas. Tech. (USA)*, vol.25, no.9, p.742-4 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.37-8 (Sept. 1982). [received: May 1983]
- The certification of a strain-gauge transducer requires the use of a simulator for the output signal of the strain-gauge resistor as the standard facility, this being a device that enables one to set the relative value $\Delta R/R$ with the required accuracy. This causes certain difficulties when one has to deal with transducers with wide limits of measurement and small errors. The authors consider checking the scale uniformity for a transducer with a four-digit inductive divider. In the coil for each digit, there are not only ten sections for

balancing the input signal but also a section equal in number of turns and therefore in induced EMF that transmits 1/10 of the voltage to the coil for the next digit. In the last digit, this section corresponds in induced EMF to one in the least-significant digit and does not participate in the automatic balancing. (no refs.)

74456 Error determination for standards and limits to influencing factors in metrological certification of strain gauges. L.I.Kosov.

Meas. Tech. (USA), vol.25, no.9, p.744-6 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.38-9 (Sept. 1982). [received: May 1983]

Relations are derived for the permissible limit of the errors in standard facilities and for the influencing quantities for various characteristics of a strain gauge. These formulas enable one to use the characteristics laid down in the technical documentation to select measuring facilities having the required accuracy in testing samples of strain gauges, and also to establish the limits to the temperature variation in the time intervals. (6 refs.)

74457 Portable oscilloscope design. V.Foster (Hitachi Denshi (UK), Hendon Ltd., England).

New Electron. (GB), vol.16, no.8, p.56, 60 (19 April 1983).

Discusses the design of an Hitachi oscilloscope aimed at the field service market. The instrument had to be small and light, yet robust and easy to use, and due to these needs less obvious factors soon come into play. Since it had to have battery operation power consumption had to be kept to a minimum. The three areas where power could be saved: the DC converter; the cathode ray tube and the vertical output amplifier were all specially designed for maximum economy. (no refs.)

- Int. J. Heat & Mass Transfer (GB)*, vol.26, no.6, p.805-14 (June 1983).
- Experimental data relating to the heat transfer performance of sine-duct type passages in laminar flow ceramic regenerator matrices are reported. In particular, the range of aspect ratio (ratio of passage height to base) for which data is available is extended and the influence of passage geometry is considered in a detailed comparison of the measurements with previously reported data. The results indicate that no clear advantage is likely to be obtained with

the higher aspect ratio matrices tested and overall the level of heat transfer is higher than may be expected from predictions with standard boundary conditions. (39 refs.)

74461 Observations on the stability of thermistors. T.J.Edwards (Phys. Dept., Univ. of Western Australia, Nedlands, Western Australia, Australia). *Rev. Sci. Instrum. (USA)*, vol.54, no.5, p.613-17 (May 1983). This paper investigates the long-term stability of three different types of thermistor with room-temperature resistances ranging from 80 to 150 k Ω . Precision measurements of thermistor resistance and temperature were made in a thermal environment controlled to ± 3 μ K. Measurements took place in between periods of limited thermal cycling and also during 100 days at constant temperature. Mechanical shock and strain appear to be the cause of the high drift rates observed in some thermistors; the majority of the thermistors were, however, very stable, with drift rates around 0.1 mK per 100 days and were unaffected by thermal cycling. Such low drift rates indicate that certain thermistors could be used as convenient temperature transfer standards with a reproducibility in the submillikelvin range. (17 refs.)

07.20D Thermometry

74462 Gate controlled amplifier for platinum NMR thermometry. Y.Jin-zaki (Dept. of Materials Sci., Hiroshima Univ., Hiroshima, Japan), Y.Okuda, A.J.Ikushima.

Cryogenics (GB), vol.23, no.6, p.321-3 (June 1983). A 250 kHz pulsed NMR circuit for measurement of platinum nuclear susceptibility is described. The nuclear free induction decay signal is detected using the single-coil method. Saturation of the amplifier is avoided by gating the RF pulse. This system is used for nuclear thermometry below 30 mK. (11 refs.)

74463 Fast neutron produced $^{54}\text{MnFe}$ nuclear orientation thermometers. H.Postma, H.Brouwer, H.C.Meijer (Dept. of Appl. Phys., Univ. of Technol., Delft, Netherlands).

Cryogenics (GB), vol.23, no.6, p.328-30 (June 1983). Fast-neutron irradiation of pure iron foils has been used to produce ^{54}Mn in iron for nuclear orientation thermometry instead of the commonly used diffusion technique. Compared with a $^{60}\text{CoCo}$ nuclear orientation thermometer good agreement was found. No deviations occurred if an externally magnetizing field of 0.2 T or larger was used. (10 refs.)

74464 Measurement of high gas-stream temperature using dynamic thermocouples. N.Venkatramani, P.Satyamurthy, N.S.Dixit, J.P.Lancelot, V.K.Rohatgi (Plasma Phys. Section, Bhabha Atomic Res. Centre, Bombay, India).

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.663-9 (May 1983). The dynamic probe technique using the transient response of a thermocouple is one of the methods of measuring high temperature flowing gases. In this paper, the complete dynamic response of a thermocouple has been solved consisting of convective, conductive, and radiative terms. The solution has been used to arrive at correction factors for actual experimental data. The use of dynamic thermocouples in the measurement of temperature profiles has also been illustrated by experiment. The model is verified at lower temperatures using a bunsen flame. (9 refs.)

74465 New method for visualizing temperature distributions using thermochromism. O.Sano, R.Takaki (Faculty of General Education, Tokyo Univ. of Agriculture & Technol., Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1549-54 (May 1983). Thermochromism in aqueous solutions of cobalt chloride with sodium chloride was used to visualize temperature distributions in a liquid. Changes of color of the solution due to temperature variations were observed both by direct photography and by measurements of the transmittance of light. The advantage of the present method is that it visualizes the temperature itself (not its gradient) without giving any disturbance to the fluid. Several examples of applications to typical flows were shown.

74466 A temperature sensor using moire technique. S.F.Su, D.K.Hamrick (Dept. of Electrical Engng., Univ. of South Florida, Tampa, FL, USA). *IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA*, 11-14 April 1983 (New York, USA: IEEE 1983), p.413-15

A sensitive temperature sensor based on moire pattern multiplication was experimentally simulated. The simulations showed that the sensor is capable of measuring a very small temperature variation of a medium in the liquid or vapor phase. The measuring system makes no physical contact with the medium which makes it suitable for contaminated environments that can not be directly contacted by the instruments. The sensitivity of the sensor (better than 0.01°C) is examined and some applications are discussed. (14 refs.)

07.20F Calorimetry

74467 Photometric characteristics of calorimeters having conical cells of tantalum. S.A.Kaufman, A.A.Liberman, O.I.Yakovleva.

Meas. Tech. (USA), vol.25, no.9, p.729-31 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.18-19 (Sept. 1982). [received: May 1983]

Standard measuring facilities for the impulsive energy of laser radiation must operate, in accord with the All-Union Checking Scheme, over wide spectral ($\Delta\lambda = 0.4$ to 12 μm) and dynamic (total energy in a pulse $W = 1 \cdot 10^{-2}$ to $1 \cdot 10^2$ J) ranges. Their total error δ_0 in this case is equal to 2-5%. In choosing material for the cavities used as receiving elements of measuring transducers for the standard units indicated it is necessary that it should have great resistance to the laser radiation (a power density $E > 10^5$ W/cm 2) and should provide a high value of the absorption coefficient for the cavities over the entire spectral

range. In view of this, the photometric characteristics of tantalum have been investigated and its possible application verified. (2 refs.)

74468 Chart for estimation of conduction heat leak from specimens used in the measurements of properties by the transient calorimetric technique. C.K.Hsieh, S.L.Yang (Mech. Engng. Dept., Univ. of Florida, Gainesville, FL, USA).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.600-3 (May 1983).

In measuring thermophysical properties using the transient calorimetric method, conduction heat leak from test specimens can be a source of error if not properly accounted for. An analysis method is presented in this paper for determining the magnitude of this leak. The analysis consists of deriving the temperature profiles in the specimen support. These temperatures are then used to determine the heat leak using two different approaches. In the first approach, the heat penetration depth in the support is derived and used to obtain an added thermal capacitance to the specimen. In the second approach, the heat leak was considered to reduce the net heat input. Both small and large heat-leak cases were analyzed, with the latter estimated by means of two recurrence relations. A chart was also developed for a rapid estimation of this leak. In the absence of a reliable experiment to measure the heat leak, this paper provides a viable alternative for accurate leak determination. (13 refs.)

07.20H Furnaces

74469 Resistively heated high-temperature furnace for PES experiments on free atoms in the UHV with synchrotron radiation. K.-G.Wagner (D. Weinhagen mbH Co. KG, Elmshorn, Germany).

Vak.-Tech. (Germany), vol.32, no.3, p.67-9 (April 1983). In German.

Atomic spectroscopy with synchrotron (beam source of high intensity and continuous spectral distribution) makes it possible to prove the theoretical calculations for many-electron systems (momentaneous correlation of electron orbitals in the initial state, in the course of excitation and in the final state). The sample has to be converted in the vapour state to avoid interferences of neighbouring atoms. The high-temperature furnace developed and built for temperatures up to more than 1400°C for evaporation of transition elements and rare earths is described. (7 refs.)

07.20M Cryogenics

74470 A wide range low temperature digital display thermometer. Chen Shu-ch'i Fang, Chung-liang Ku, Shao-shan Sheng, Ling-hui (Shanghai Univ. of Sci. & Technol., Shanghai, China).

Chin. J. Sci. Instrum. (China), vol.4, no.1, p.37-43 (Feb. 1983). In Chinese.

The relationship between the forward voltage and temperature of Si switch diodes at the temperature range from liquid nitrogen temperature to room temperature under the conditions of different injection is discussed. The error due to approximating the nonlinear curve by a linear one is estimated. The design principle and operation of the sensor in a wide range low temperature digital display thermometer is discussed. It operates over the 70-300K range with an error below 0.5K. A conclusion is made that the V-T curve of the diode sensor at the whole temperature range can be approximated by a single straight line and that the contradiction between the high level injection and self-heat of the diode can be greatly reduced. The LT-1 low temperature thermometer is introduced. (10 refs.)

74471 Thermal design and tests of a subcooled superfluid helium refrigerator. Y.Hakuraku, H.Ogata (Mech. Engng. Res. Lab., Hitachi Ltd., Ibaraki, Japan).

Cryogenics (GB), vol.23, no.6, p.291-7 (June 1983).

Design methods for a subcooled superfluid helium refrigerator with high efficiency are studied. The design details are presented for a He I heat exchanger (perforated disk stack type), a He II heat exchanger (low fin tube type), an expansion valve, a safety valve, an initial filling valve and a pumping system. Heat loss, cooling capacity and cool-down time are also calculated. The test results for the trial-manufactured refrigeration system are presented in comparison with the designed values. (11 refs.)

74472 Continuous flow cryostats for experiments in the presence of appreciable heat influx to the specimen. A.I.Belyaeva, V.I.Silaev, Yu.N.Stelmakhov, Yu.E.Stetsenko (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, USSR).

Cryogenics (GB), vol.23, no.6, p.303-8 (June 1983).

The review describes several cryostat designs for spectral and magneto-optical studies representing continuous flow systems with sample cooling by preset temperature vapour blow-over. The characteristic features and advantages are discussed. It is shown that among present-day heat transfer methods, this one is the most efficient for studies involving appreciable heat influx to the cooled sample. (20 refs.)

74473 Use of commercial metallic strain gauges as low temperature heaters. D.Moy, A.C.Anderson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).

Cryogenics (GB), vol.23, no.6, p.330-1 (June 1983).

The heat capacity of a resistive strain gauge has been measured. Such gauges may be used as electrical heaters in low-temperature applications. The units are small, inexpensive, durable and reusable. (8 refs.)

07.25 HYGROMETRY

74474 Hygrometer classification and standardization models for static and dynamic characteristics. D. Heinze.

Meas. Tech. (USA), vol.25, no.9, p.758-63 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.51-4 (Sept. 1982). [received: May 1983] Two completely different principles that can be distinguished on the basis of the physical process in the primary transducer and therefore the character of the energy interaction between the medium and the transducer are considered. The first is that the water in the medium attenuates an energy flux emitted by a source; the mass proportion of water is indicated by the flux reaching the detector. Examples are infrared, ultraviolet, UHF, and acoustic hygrometers. The second principle employs two-way energy transfer between the medium and the transducer. The state of thermodynamic equilibrium (stationary or static) is set up between the medium and the transducer. Relations are presented which enable one to describe various methods of humidity measurement. (6 refs.)

74475 Standard humid-air generator for checking high-temperature hygrometer. V.M.Belozhko, A.S.Gridnev, I.B.Kreps, V.F.Mandrokhlebov.

Meas. Tech. (USA), vol.25, no.9, p.767-71 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.56-9 (Sept. 1982). [received: May 1983] Humid-air generators (HAG) for producing vapor-air mixtures with given parameters employ various methods in the Soviet Union and elsewhere, and the choice of these for a particular application is determined by technical and economic factors. The use of saturated salt solutions is the commonest, along with mixing of gas flows, and two-pressure and two-temperature methods. To choose a method corresponding best to the requirements for a high-temperature HAG, the authors evaluated the expected metrological characteristics of generators employing these methods. Using as the basic criterion (the expected overall error, the PSG-120 hygrometer test facility is described in some detail. (11 refs.)

74476 Salt-solution hygrometer generators [hygrometer test facilities]. A.S.Gridnev, V.F.Mandrokhlebov.

Meas. Tech. (USA), vol.25, no.9, p.772-6 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.59-62 (Sept. 1982). [received: May 1983] The availability of special facilities for determining the static and dynamic characteristics of hygrometers is one of the most important factors characterizing the accuracy and unification of humidity measurements for vapor-gas media. The authors consider the salt-solution generators (SSG) produced in the Analitpribor cooperative on the basis of saturated salt solutions. The major error components involved in SSG are examined and a brief description of the stationary GST-510, the portable GPT-130 and the UPG-110 models is presented. (16 refs.)

74477 The Rodnik-2VK standard humid-gas generator [hygrometer test facilities]. I.A.Sokov, A.A.Zhilinskii, A.P.Beloshitskii, T.A.Satyr, N.P.Guzhva, E.P.Grokh.

Meas. Tech. (USA), vol.25, no.9, p.777-9 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.63-5 (Sept. 1982). [received: May 1983]

To extend the working range in measuring relative humidity and to increase the number of transducers that can be checked simultaneously, the Kiev Automatics Institute has collaborated with Angarsk special designs office in designing the Rodnik-2VK humid-gas generator. This is a two-pressure and two-temperature generator. It consists of a Rodnik 2 generator and an external VK thermostatic chamber made by the experimental plant attached to the Kiev Automatics Institute. The Rodnik-2VK produces a vapor-gas mixture with a temperature of 5-60°C in the working volume of the outer chamber, which has an excess of 0.3-5 kPa and a relative humidity of 10-97%. The relative humidity is set by separate adjustment and stabilization of the pressure and temperature of the gas in the Rodnik 2 generator and in the working chamber. (5 refs.)

74478 Standard apparatus for checking and calibrating hygrometers at negative temperatures. E.A.Gershovich, L.D.Mchedlidze, N.D.Kol'shev.

Meas. Tech. (USA), vol.25, no.9, p.780-8 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.67-8 (Sept. 1982). [received: May 1983]

A standard apparatus for calibrating, checking, and testing is described. It consists of the following major units: a Polys-1 standard dynamic moist-gas generator and a thermostatic test volume, in which the hygrometers to be tested or calibrated are installed. The generator supplies this volume continuously with a flow of vapor-gas mixture with a specified and accurately known humidity. The action of the Polys-1 generator is based on phase equilibrium at negative temperatures. The generator provides a vapor-gas mixture whose humidity corresponds to a dewpoint (ice point) in the range from -60 to +20°C with an error of $\pm 0.2^\circ\text{C}$ in the dewpoint. (8 refs.)

74479 Standard hygrometer facilities at the Promengoremont cooperative. G.V.Gorev, N.E.Osipova, R.L.Tarshish.

Meas. Tech. (USA), vol.25, no.9, p.783-5 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.69-70 (Sept. 1982). [received: May 1983]

The Promengoremont production cooperative at Ivanovo operates relative-humidity transducers of EVCh type of its own manufacture in conjunction with various secondary instruments. The metrological equipment and standard facilities available at this cooperative are discussed. These include the PER-64 and PER-65 metrological chambers, a microchamber, a classification chamber and dynamic humid-gas generators operating on the two-pressure principle. A data acquisition system built for the parameters of the microclimate which is based on standardised humidity and temperature transducers is also described. (6 refs.)

74480 Standard facilities for measuring microconcentration of water in gases. A.P.Beloshitskii, Yu.A.Belousov, M.D.Simulik, L.Z.Savkun.

Meas. Tech. (USA), vol.25, no.9, p.785-7 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.70-1 (Sept. 1982). [received: May 1983]

Discusses the Soviet development of methods and facilities for measuring volume proportions of water in the range 10^{-3} - $10^{-6}\%$. The Angarsk special designs office and the Irkutsk Etalon experimental plant in the period from 1963 to 1980 produced about 30000 hygrometers for measuring the volume proportion of water and relative humidity. It is suggested that there were only about 100 metrological facilities available in 1982 (the Lena hygrometers, the Angara apparatus, and the Rodnik and Rodnik-2 humid-gas generators) and that this is far from meeting the increasing demand for instrumentation in this field. (5 refs.)

74481 Automatic digital multichannel thermohygrometer. Yu.V.Arutyana, R.Sh.Gurgenidze, T.A.Gachechiladze, R.G.Gachechiladze, N.I.Narimanidze.

Meas. Tech. (USA), vol.25, no.10, p.844-5 (Oct. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.10, p.44 (Oct. 1982).

Describes the principle of a six-channel thermohygrometer with simultaneous measurement, transformation, display, and output of the relative humidity and temperature at each interrogated point. Microelectronic and hybrid circuits can be widely used in assembling the units to measure, display, and switch the signals in a single compact unit, and it is possible to combine rack-

mounting and desk-top forms. The instrument is suitable for laboratory or industrial applications. (no refs.)

74482 Automatic high-temperature psychrometers. G.V.Bauer, L.E.Murycheva, P.A.Pidzhimyan, T.Yu.Kharlamova.

Meas. Tech. (USA), vol.25, no.10, p.845-7 (Oct. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.10, p.45-6 (Oct. 1982).

Automation and acceleration of engineering processes have increased the demand for monitoring humidity on working gas mixtures at high temperatures. The operation and technical parameters of two hygrometers developed in the Soviet Union are described: the APV-201 automatic psychrometric humidity meter; and the APG-206 automatic psychrometric hygrometer. Both meters employ thermistors as the sensing elements and can be used for measuring humidity at the 30 to 100°C and 40 to 200°C ranges, respectively. (3 refs.)

74483 Piezoelectric sorption hygrometers. L.Z.Savkun, I.A.Rudykh, A.N.Dryanov, V.E.Ivashchenko.

Meas. Tech. (USA), vol.25, no.10, p.853-5 (Oct. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.10, p.52-3 (Oct. 1982).

One of the various sorption methods for measuring humidity is the so-called piezoelectric sorption kind based on the mass sensitivity of piezoelectric quartz resonators that utilize the thickness-shear type of vibrations. A single-channel sorption hygrometer developed on the basis of the humidity-sensitive piezoelectric sorption element with a film of silica-gel. The type Istok-1 hygrometer operates on the following principle: it converts simultaneously the relative humidity by means of a quartz thermal converter into discrete signals which are proportional to the relative humidity and the volumetric fraction of moisture of the saturated gas, and multiplies these signals by utilizing the relationship $B = \phi B_s$, where B is the volumetric fraction of moisture in the gas and B_s is the volumetric fraction of moisture in the saturated gas. (3 refs.)

74484 Heated hygrometer suite. A.M.Saradzhev, V.F.Mandrokhlebov, G.A.Nersesyan, R.Ya.Tiraspol'skaya, Z.F.Edzhubyan.

Meas. Tech. (USA), vol.25, no.10, p.862-4 (Oct. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.10, p.58-60 (Oct. 1982).

A system of heated hygrometers is described which is based on a unified transducer consisting of humidity and temperature transducers together with universal equipment providing measurement over wide ranges in the one-parameter humidity characteristics for air and gases under various working conditions (dewpoint and mass proportion of water), or two-parameter ones (relative humidity and heat content). The natural output characteristics of the humidity and temperature transducers are converted to unified electrical signals as a current (from 0 to 100 μA) and a voltage (from 0 to 10 mV) by means of various intermediate transducers based on standardized designs providing direct measurement of any of the above parameters on uniform (linear) scales in measuring or recording instruments. A high degree of unification has been attained by using the same circuit for all the intermediate transducers, which in each particular case differs only in the nominal values of the resistors. (no refs.)

74485 Improvements in thermoelectrolytic humidity transducers. A.M.Litvinov.

Meas. Tech. (USA), vol.25, no.10, p.867-70 (Oct. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.10, p.62-4 (Oct. 1982).

Describes the Soviet development of standard thermoelectric humidity transducers of LiCl type. Amongst the topics discussed are advancements of manufacturing technology, development of models which provide for explosion safety, protection from dust and spark safety in the power supply; and construction of the nominal static characteristic by means of nonuniform piecewise-linear approximation. The DV-1K model is considered in some detail. (13 refs.)

74486 Method of improving the accuracy of a thermoelectrolytic humidity transducer. Yu.G.Zav'yalov, A.M.Litvinov.

Meas. Tech. (USA), vol.25, no.10, p.870-3 (Oct. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.10, p.64-6 (Oct. 1982).

Heated thermoelectrolytic humidity transducers are widely used in measurement and control systems for gas humidity because of their high accuracy, reliability, and interchangeability. However, their use is held back to some extent by the fact that the readings are slightly dependent on the uninformative parameters. An analytical expression is derived that enables one to eliminate the dependence of the readings on the uninformative parameters. A test is proposed for remote checking of the reading reliability. The results can be used to improve the accuracy in measuring atmospheric humidity without altering the design of the device. (4 refs.)

74487 UHV-compatible reaction cell for combined high-and low-pressure studies of surface reactions. K.-E.Keck, B.Kasemo (Phys. Dept., Chalmers Univ. of Technol., Göteborg, Sweden), A.Hoglund.

Rev. Sci. Instrum. (USA), vol.54, no.5, p.574-8 (May 1983).

The construction and performance of a combined reaction cell and sample exchange lock for studies of surface reactions at pressures up to a few atmospheres is described. In combination with a specially designed sample holder this construction allows simple and rapid transfer to the sample between the ultrahigh vacuum system and the reaction cell. The reaction cell is a self-contained unit that can be mounted on, e.g. a 2 $\frac{1}{2}$ -in. Con-Flat flange (or any other vacuum port with an ID ≥ 38 mm). The sample holder can be mounted on any commercial sample manipulator. In both the high- and low-pressure positions the sample can be heated and cooled. Results are presented for the times involved in moving the sample from high to low-pressure environments, pump-out times, etc. The use of this equipment in studies of the catalytic activity of Pt for the H_2 oxidation is briefly described. (6 refs.)

74488 Electromagnetic bearing for an epitaxy centrifuge in high vacuum. V.G.Schweitzer, A.Traxler, H.Bleuler (Inst. fur Mech., ETH, Zurich, Switzerland), E.Bauser, P.Koroknay.

Vak.-Tech. (Germany), vol.32, no.3, p.70-4 (April 1983). In German.

The principle of the contactless, electromagnetic suspension can be very well applied to vacuum techniques. This kind of bearing is used to suspend the rotor of an epitaxy centrifuge within a thin-walled vacuum tank. The bearing magnets and the rotor drive are outside the tank. The vertically hovering

rotor carriers on its lower end a heated crucible for the epitaxy experiments in the centrifugal field. These experiments require high vacuum conditions and an absolute absence of hydrocarbons. The authors describe the setup of the magnetic suspension, its dynamic behaviour. They describe the setup of the magnetic suspension, its dynamic behaviour, the vacuum-technical equipments of the construction, and its application to liquid phase epitaxy. (6 refs.)

07.30D Vacuum meters

74489 Method for measuring a vacuum in an environment at liquid helium temperatures. L.Cesnak, C.Schmidt (Kernforschungszentrum Karlsruhe, Inst. für Tech. Phys., Karlsruhe, Germany).

Cryogenics (GB), vol.23, no.6, p.317-19 (June 1983).

The experimental results of a new method to measure a vacuum in an environment at liquid helium temperatures are presented. The method uses a thin superconducting wire suspended in the vacuum vessel, the wire is heated by a current pulse $>I_c$. The cool down time, which depends on the heat transfer into the rest gas and on the axial heat conductance of the wire, is a measure of the vacuum and it is detected by the recovery of the wire to superconductivity. The results exhibit good resolution in the range of pressures from 5×10^{-3} to 5 Pa (5×10^{-5} to 5×10^{-2} mbar). (4 refs.)

74490 A simple measurement method of pyroelectric coefficient for ferroelectric crystals. Shao Shi-ping.

Chin. J. Sci. Instrum. (China), vol.4, no.1, p.94-7 (Feb. 1983). In Chinese. (8 refs.)

74491 A new method of minority carrier lifetime measurement by the microwave photoconductive decay technique. Wang Zong-xin, Bao Zong-ming.

Fudan J. (China), vol.21, no.4, p.462-7 (Dec. 1982). In Chinese. [received: June 1983]

A new experimental method of contactless measurement of the minority carrier lifetime of a semiconductor using dielectric waveguides is introduced, and an analytical result is given. It has been proved that the decay process of minority carriers in the wafer can be determined from the decay curve proportional to the microwave transmission coefficient. By this, one can calculate the minority carrier lifetime of the semiconductor sample. The results coincide well with those of high frequency photoconductive decay method. Using this technique, one can also measure the distribution of minority carrier lifetimes in a wafer. This technique can be used as a monitor in semiconductor wafer processes. (7 refs.)

74492 Permittivity measurements of lossy liquids at millimeter-wave frequencies. L.Zanforline (Istituto di Elettrotecnica ed Elettronica, Univ. di Palermo, Palermo, Italy).

IEEE Trans. Microwave Theory & Tech. (USA), vol.MTT-31, no.5, p.417-19 (May 1983).

A measurement system is described which allows the determination of the complex permittivity of high-loss liquids at millimeter waves. Basically, the setup consists of a waveguide interferometer whose unknown arm embodies a liquid holder irradiated by an open-ended rectangular waveguide. The sample thickness is varied by means of a piston driven by a micrometer screw. The bridge output then is read as a function of the liquid thickness. Best fitting between experimental and computed data through a suitable model of the system enables the permittivity to be determined. The system can operate, with high sensitivity, over the whole frequency range of the dominant mode propagating in the waveguide setup employed. System performance is described through a set of experimental results obtained on ethanol, methanol, and pure water at 20°C and 70 GHz. (9 refs.)

74493 Peak sampled vibrating-reed for the measurement of electric fields in the presence of space charge. M.N.Horenstein (Dept. of Electrical Engng., Boston Univ., Boston, MA, USA).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.591-3 (May 1983).

An electronically sampled vibrating-reed DC electric field sensor of the chopping field-mill variety is described. The compact, battery powered, self-contained sensor, which can be imbedded in any electrode surface, is capable of measuring true DC fields up to the 10^6 V/m range over an indefinite period of time; however, continuous peak sampling of the chopped periodic signal allows transients on the order of 10 ms to be monitored. Measurement in the presence of ionic space charge is made possible by keeping all structural components exposed to the field at a single equipotential. (8 refs.)

74494 A device for measuring the residual electrical conductivity of single crystals. V.A.Sandovskii, V.A.Romanov, Yu.I.Rebrin (Inst. of Metal Phys., Acad. of Sci., USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.745-7 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.89-91 (Sept. 1982).

The authors have developed and constructed a device with an attached small eddy-current transducer for measuring the residual electrical conductivity of single crystals. (2 refs.)

74495 Evaluation of a synthetic time domain reflectometry system. M.R.Yeo (Marconi Electronic Devices, Lincoln, England).

Colloquium on 'Microwave Circuit CAD Techniques', London, England, 18 April 1983 (London, England: IEE 1983), p.2/1-4

Using Fast Fourier Transform (FFT) the accurate frequency domain measurements are converted into the time domain and a trace is produced which is similar to the sampling scope trace on a conventional TDR. This can then be used in the conventional way to study individual discontinuities. The difference between the synthetic TDR and the conventional TDR is that measurements made with the automatic network analyser are far more accurate than those from the sampling oscilloscope and more importantly, the practical difficulties of generating fast rise time pulses no longer limits the power available in high order harmonics (necessary for higher resolution measurements or discontinuities), since the synthetic TDR technique uses discrete frequency measurements with ample available power all the way through 18 GHz. A further advantage of the synthetic TDR technique is that the data can be manipulated. (4 refs.)

74496 Cryostats for SQUID magnetometers. O.A.Testard (CENS, Gif-sur-Yvette, France), M.Locatelli.

Cryogenics (GB), vol.23, no.6, p.299-302 (June 1983).

A non-metallic and non-magnetic cryostat, with a very low thermal budget and a container type autonomy was developed, to condition SQUID magnetometers whose maximum sensitivity reaches $10^{-14} \text{ T Hz}^{-1/2}$. This instrumentation uses composite materials, thermal shock and vibration resistant, multilayer thermal radiative insulation, to detect vibrations with thermal equivalent emissivity lower than 10^{-3} . (11 refs.)

74497 Magnetic sensors with good signal-to-interference discrimination [biomagnetism application]. J.R.Storey (Dept. of Phys., Univ. of Auckland, Auckland, New Zealand).

Nuovo Cimento D (Italy), vol.2D, ser.1, no.2, p.153-65 (March-April 1983). (Proceedings of the Fourth International Workshop on Biomagnetism, Rome, Italy, 14-16 Sept. 1982).

Principles are established for the design of coil arrays which generate distant magnetic fields diminishing as a high inverse power of the distance. By a principle of reciprocity these arrays, when used as sensors in induction and SQUID magnetometers, have an inherently low sensitivity to distant sources of magnetic field. (8 refs.)

74498 Optimisation of the second-order gradiometer base length that has been designed for the measurement of weak inhomogeneous magnetic fields [biomagnetism application]. V.Zrubec, P.Vrabcek, P.Tekel (Inst. of Measurement & Measuring Tech., Slovak Acad. of Sci., Bratislava, Czechoslovakia).

Nuovo Cimento D (Italy), vol.2D, ser.1, no.2, p.175-83 (March-April 1983). (Proceedings of the Fourth International Workshop on Biomagnetism, Rome, Italy, 14-16 Sept. 1982).

Deals with an optimisation problem of the second-order superconducting gradiometer sensor systems that have been designed for measurement of the weak inhomogeneous magnetic fields in a magnetically disturbed environment. The conditions of maximum signal-to-noise ratio of the output of superconducting quantum magnetometers are considered. The influence of measured signal source parameters, of an outside disturbing source and of the own noise of the magnetometer on the gradiometer base length selection is analysed. (3 refs.)

74499 Flux quanta counting magnetometer using a thin-walled superconducting ring. D.S.McLachlan (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.11A, p.5532-3 (April 1983).

Describes a flux quanta counting magnetometer which can also be used as a digital voltmeter or ammeter. (no refs.)

74500 Permanent magnet undulators. K.Halbach (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

J. Phys. Colloq. (France), vol.44, no.C-1, p.211-16 (Feb. 1983). (Bendro Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982).

Pure rare earth cobalt (REC) undulators and hybrid undulators, using both REC and steel, are described and compared with each other and with conventional and superconducting undulators. (5 refs.)

74501 An effective phase correction method in Fourier transform spectroscopy. Meng Ching-an (Inst. of Phys., Acad. of Sci., Peking, China).

Chin. J. Sci. Instrum. (China), vol.4, no.1, p.15-17 (Feb. 1983). In Chinese.

An effective method of correcting the first order phase shift resulting from the delayed sampling of time-domain signal of pulsed NMR is proposed. The correct shift time domain data are obtained by means of Fourier transforms with the aid of a computer. The method is especially effective in solid state NMR spectroscopy. (3 refs.)

74502 Trial-production of variable temperature equipment for ESR spectra instrument. Hsi Dan, Chao Pau-In, Wang Tah-hui (Inst. of Biophys., Acad. of Sci., Peking, China).

Chin. J. Sci. Instrum. (China), vol.4, no.1, p.72-6 (Feb. 1983). In Chinese.

With the development of electron spin resonance spectra technology, variable temperature equipment has become an important accessory. The authors describe the principle, construction and performance of a trial-produced variable temperature equipment and present some experimental results obtained with this equipment. (5 refs.)

74503 Computer simulation of NMR excited by synthesis frequencies. Wang Tung-sheng, Wu Hsueh-wen (East China Normal Univ., China).

Chin. J. Sci. Instrum. (China), vol.4, no.1, p.81-7 (Feb. 1983). In Chinese.

The synthesis frequency excited NMR is a novel method in high resolution Fourier transform NMR. In the synthesis frequency excitation, the intensity of the spectrum is not uniform and its distribution may be designed according to requirements. The synthesis frequency excitation may be performed with a modified continuous wave spectrometer. It has the same sensitivity as pulse Fourier transform NMR, but without the shortcomings of the latter. The principles of this novel method are described. For exploring its applications, a computer simulation of the experiment has been carried out using the DJ5-130 computer. It is shown that this method can be used to suppress strong solvent peak, to reduce the dynamic range of NMR signal, and to excite certain parts of the spectra. The method is not suitable for relaxation time measurements. (6 refs.)

74504 Phase shifter for the phase-detection scheme of magnetic resonance. S.Sanyal, A.K.Roy (Saha Inst. of Nuclear Phys., Calcutta, India), P.K.Nandi.

Indian J. Pure & Appl. Phys., vol.21, no.3, p.171-5 (March 1983).

A simple phase shifter for the reference signal is capable of handling the entire range of field modulation frequency used in magnetic resonance spectrometers. A discussion of the normally adopted technique for the reduction of the unavoidable switching spikes which arise when JFETs are used as analog switches in the phase-detector, is also given. (6 refs.)

74505 Frequency-pulling superregenerator for observing NQR. O.N.Bryukhanov, T.N.Rudakov (Kalininingrad Univ., Kaliningrad, USSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.4, pt.2, p.947-8 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.151-3 (July-Aug. 1982). [received: May 1983]

A description is given of a superregenerator with frequency pulling from an external source for the range 20-70 MHz. The design allows one to obtain the NQR absorption of dispersion signal at the output. The quenching frequency is 38 kHz, while the oscillation amplitude in the tuned circuit is 0.5 V, the modulation frequency is 30 Hz, and the frequency deviation in frequency modulation is 3 kHz. The superregenerator described can be used in an NQR spectrometer. It has been tested as a temperature transducer for the range 77-443K. (5 refs.)

74506 Use of a spiral fitting in observing nonstationary ESR signals. Yu.F.Panferov, O.Ya.Grinberg, A.A.Dubinskii, Ya.S.Lebedeve (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.4, pt.2, p.949-50 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.153-4 (July-Aug. 1982). [received: May 1983]

A method is described for substantially increasing the amplitude of the magnitude UHF field at the specimen in a pulsed ESR spectrometer, which involves placing a spiral fitting on the ampul. (5 refs.)

74507 Extension of the lower limit of current measurements by the NMR method. A.I.Zhernovoi, N.M.Mel'nikov. *Meas. Tech. (USA)*, vol.25, no.10, p.879-80 (Oct. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.10, p.72-3 (Oct. 1982).

Describes the construction of a primary NMR converter for measuring both high and low DC currents. It uses a permanent magnet to obtain an additional uniform magnetic field, which produces the NMR signal, on which the field produced by the current being measured is superimposed. The permanent magnet produces in the air gap of the primary transducer, in which the NMR pickup is placed, a magnetic field with parameters which ensure a signal/noise ratio of not less than five when there is no current flowing in the conductor. 74508 A quasi-optical nulling method for material birefringence measurements at near-millimeter wavelengths. G.J.Simonis (Army Electronics Res. & Dev. Command, Harry Diamond Labs., Adelphi, MD, USA). *IEEE Trans. Microwave Theory & Tech. (USA)*, vol.MTT-31, no.4, p.356-8 (April 1983).

A quasi-optical technique for the measurement of birefringence is demonstrated at 245 GHz. The technique is applied to crystal quartz. The measured values are compared with values reported at nearby frequencies. The technique is used to determine the difference between the ordinary and extraordinary real indices of refraction directly, rather than by deducing the difference from separate measurements of the two indices. The technique is based on establishing a transmission null, thus providing appreciable sensitivity and precision for the measurement. (11 refs.)

74509 A Computer controlled time resolved optical intensity profile measurement system. I.H.White, J.E.Carroll (Dept. of Engng., Cambridge Univ. Engng., Cambridge, England). *Opt. Commun. (Netherlands)*, vol.45, no.5, p.289-94 (1 May 1983).

Describes a computer controlled system which provides data management and position control for time resolved measurement of near and far field, along with charge carrier concentration distributions of semiconductor lasers. Of particular interest is the manner in which microprocessor control of inexpensive motorised micrometers is used to provide accurate repeatable movements on submicron scales. Due to its noise reduction capability through computer averaging this system has been operated in conjunction with a 50 ps risetime photodiode, and thus is believed to allow time resolved measurement on the shortest reported timescales. The system provides a further advantage in that experimental data may be stored to give easy access for further processing. (6 refs.)

74513 Measurement of Stokes parameters and their transformation matrices with the help of a magneto-optical cell. V.B.Karavanov, M.Yu.Sakhnovskii.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.599-604 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.831-6 (May 1982). [received: Feb. 1983]

Examines a procedure for measuring the Stokes parameters with the help of a magneto-optical cell, separating the polarized (coherent) part of the beam, determining the difference in phases and ratio of the amplitudes of the linearly polarized components of radiation under conditions of specular reflection directly from intensity measurements. (11 refs.)

74514 Highly sensitive polarimetric techniques (review). V.S.Zapasskii. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.857-69 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.181-96 (Aug. 1982). [received: April 1983]

The author discusses existing methods of obtaining high sensitivity in polarimetric measurements. He concentrates his attention on measurement techniques that do not make particularly high demands on the optical quality of the investigated sample, i.e. the most practical schemes, which can be used in the design of commercial polarimeters and spectropolarimeters. He also briefly discusses the recently developed 'supersensitive' intracresonator methods, which can be used to detect the smallest values of optical anisotropy and are of particular promise for use in fundamental physical research. (28 refs.)

74515 Determination of the gain and absorption coefficients from Faraday rotation of the polarization plane of radiation. V.V.Mashko.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.916-21 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.250-6 (Aug. 1982). [received: April 1983]

The search for active laser media, the recording of low concentrations of materials, and other problems require the development of sensitive methods for the determination of the gain and absorption coefficients. One of these methods of determining optical densities is based on measurement of the phase anisotropy induced in a medium by an external field. Due to the high sensitivity of the measurement of the Faraday rotation angle of the polarization plane of radiation, the sensitivity of the determination of the optical densities by such measurements can attain a few times 10^{-8} even in the intracresonator version. Placement of the sample being investigated into a Fabry-Perot interferometer or a laser resonator permits increasing the sensitivity of one to two more orders of magnitude. The author considers the following measuring scheme: radiation of the probing source which is linearly polarized along the X axis passes through a cell containing the medium being investigated. A longitudinal magnetic field is imposed on the medium, as a result of which rotation of the polarization plane of the probing radiation occurs which is recorded with a scheme having a crossed polarizer, which consists of a polarizer and a photorecording system, or by a balance scheme which includes a Glan prism which splits the light beam incident on it into two orthogonally polarized beams (whose polarization planes make angles $\pm 45^\circ$ with the X axis), two photocells, and a balance amplifier. (9 refs.)

74516 Signal-to-noise ratio analysis of a digital polarimeter application to thermal imaging. B.F.Lamoureux, B.S.Prade (Lab. d'Optique Appl., Ecole Polytech.-ESTA, Palaiseau, France).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.582-5 (May 1983). A digital scanning polarimeter is described. It measures the local variations of the rotatory power of a thin liquid crystal target. This device is used for thermal imaging purposes. The incident scanning beam is split after traversing the target in two parts and then analyzed with two analyzers and detectors. Taking into account the photon noise, the existence of an optimal angle of the analyzer azimuth is shown. A numerical example is given. (3 refs.)

74517 Polarimetric sensors: exploiting the axial stress in high birefringence fibers. S.C.Rashleigh (Naval Res. Lab., Washington, DC, USA).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.210-13

An alternative configuration for polarimetric fiber-optic sensors has been proposed and demonstrated. It exploits the relationship between the axial stress and the transverse stress asymmetry in high birefringence fibers. Axially straining the fiber induces a large change in the fiber birefringence. In some applications, adequate sensitivity may be obtained by just axially stressing the birefringent fiber. This greatly simplifies the fabrication of polarimetric sensors as it may not be necessary to fabricate the sensor such that the field to be detected stresses the fiber asymmetrically. However, increased sensitivity can be obtained by fabricating the sensor such that the action of the physical field stresses that fiber both axially and transversely in the appropriate direction. For either configuration, sensitivities comparable to those of the Mach-Zehnder interferometric sensors can be expected. Also sensitivities up to ~ 20 times larger than those previously reported for polarimetric sensors have been demonstrated. (12 refs.)

07.60H Refractometry and reflectometry

74518 Heterodyne OTDR at 0.82 μ m. E.Bodtker, B.Tromborg (Telecommunication Res. Lab., Copenhagen, Denmark), J.Mark, C.J.Nielsen. *Electron. Lett. (GB)*, vol.19, no.10, p.361-2 (12 May 1983).

The authors report on a heterodyne OTDR measurement on a single-mode fibre at a wavelength of 0.82 μ m using a stabilised semiconductor laser. In the actual set-up the dynamic range is limited by polarisation noise. (4 refs.)

74519 Application of photon counting techniques to POTDR. J.N.Ross (CEGB, Bristol, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.169-72.

Polarization optical time domain reflectometry (POTDR) is a technique for measuring the change in polarization state of light as it travels along a single mode optical fibre. The technique enables an optical fibre to be used as a distributed sensor which is able to make local measurements of stress, magnetic and possibly electric fields. The author reports the use of a photon correlation technique to process the signal from the detector and compares this method of signal processing with the analogue method used by Ross (see Appl. Optics, vol.21, p.3489, 1982). (5 refs.)

07.60L Interferometry

74520 Complex interferometry. L.Mertz (Phys. Sci. Lab., Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).

Appl. Opt. (USA), vol.22, no.10, p.1530-4 (15 May 1983).

An efficient device using a transparent grooved screen and three detector channels is described for measuring the complex coherence factor between two optical beams. The device statically provides both in-phase and quadrature fringe components, the same signals as are customarily available in radio interferometry. The deleterious effects of a nonplanarism in stellar interferometry are described along with a novel configuration for interferometrically combining two telescopes to provide simultaneously fringes anywhere in the field of view with the goal of optical aperture synthesis. Complex fringe detection also has certain applications in spectral interferometry, and a suitable interferometer with achromatized throughput is described. That interferometer may also be used for distance or thickness measurement. (17 refs.)

74521 Real-time fringe-pattern analysis. L.Mertz (Phys. Sci. Lab., Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).

Appl. Opt. (USA), vol.22, no.10, p.1535-9 (15 May 1983).

The task is to learn the phases of real positive intensity fringes from an optical testing interferometer. The introduction of substantial tilt into the interferometer establishes a field of finely spaced fringes that serve as a spatial heterodyne carrier. Sequential pixel values from a TV video signal of the picture are distributed among three separate signal channels, every third pixel going to the same channel. The distribution rate is set at ~ 3 pixels/fringe so that each channel senses one phase of a three-phase stroboscope or moiré. Complex weighting of the channel signals eliminates the common mode to provide an in-phase and quadrature analog fringe signals. A direct analog-to-digital arctangent converter, with that analog signal pair as input, provides 4-bit ($1/16$ -cycle resolution) fringe phase at a 5-MHz sampling rate. The converter is coupled to a turns counter that automatically registers unwrapped phase. The similarity of the signals to NTSC color TV encoding is noted along with certain other applications. (3 refs.)

74522 Talbot interferometry with a vibrating phase object. H.Kaijun, J.Jahns, A.W.Lohmann (Phys. Inst., Univ. Erlangen, Erlangen, Germany).

Opt. Commun. (Netherlands), vol.45, no.5, p.295-300 (1 May 1983).

Describes a Talbot interferometer for measuring a vibrating phase object. The time-average fringes are moiré patterns modulated by the zeroth-order Bessel function. They provide information about the tilt at every point of a vibrating plate, for example. The Talbot interferometer is robust (common path) and cheap (printers grids as beam-splitters). The experiments can be performed with laser illumination or with a collimated beam of white light. Some experimental results are shown. (9 refs.)

74523 Autocorrelation of ultrashort optical pulses using polarization interferometry. Pochi Yeh (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).

Opt. Lett. (USA), vol.8, no.6, p.330-2 (June 1983).

A proposal and an analysis are presented for the autocorrelation of ultrashort optical pulses by using polarization interferometry in a birefringent crystal wedge. (8 refs.)

74524 Outlook for the use of the Michelson interferometer for measuring the physical parameters of nonuniform semiconductor structures. V.E.Kaminskii, A.A.Kokin.

Sov. Microelectron. (USA), vol.11, no.5, p.231-7 (Sept.-Oct. 1982). Translation of: *Mikroelektronika (USSR)*, vol.11, no.5, p.393-401 (Sept.-Oct. 1982). [received: May 1983]

The Michelson interferometer is a quite universal device which can be used for investigations, in particular of semiconductor structures. It allows one to determine the thickness of dielectric films, the refractive index and the profile of the carrier concentration distribution in semiconductors over a quite broad range of values. The Tikhonov regularization method with a stabilizer of the first order allows one to reproduce the carrier concentration distribution profile with good precision. The spatial resolution of the method described with the use of a Michelson interferometer is determined by the position of the short-wavelength edge of the spectrum from the radiation source. For semiconductor wafers, using the IR region of the spectrum, it turns out to be possible to achieve resolution of structural details even with submicron dimensions. Here the requirement of a large dynamic range of the detection apparatus is essential. (7 refs.)

74525 Automated laser speckle interferometry displacement contour analyzer. J.A.Schaeffel, Jr. (US Army Missile Command, Redstone Arsenal, AL, USA).

In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.77-98. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The theory and an experimental configuration were developed for automated displacement contour analysis of laser speckle interferograms. The number of displacement contours available is proportional to the number of diffraction fringe orders n available throughout the offset distance x . The system was checked to determine how well fringe contours could be measured and found to be accurate to at least 4% of the measured distance by hand. System scanning speed is extremely important, and it was found that 5000 data points could be analyzed in about 4 min when the system was operating at about 20% of its maximum rated speed. This is very encouraging for systems in which as many as 10^6 data points would be analyzed. Advantages of the present system over those of the past include virtual operator-free scanning, high speed, low cost and full field displacement field mapping. (no refs.)

74526 Aperture analysis of laser speckle interferograms. J.A.Schaeffel, Jr. (US Army Missile Command, Redstone Arsenal, AL, USA).

In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.99-111. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The aperture analysis of laser speckle interferograms is a simple direct approach to low-cost quantitative analysis. The process is simple to perform and provides a permanent record of the analysis. Basic advantages of this analysis include: low cost, simple optical alignment, simple system, permanent record of the data, excellent fringe contrast, high signal to noise ratio, real time inspection, and variable sensitivity. The specific disadvantage is that a slight amount of interpretation and formula usage is required. This is so insignificant that it is of little concern. (3 refs.)

74527 Partially coherent sources in interferometric sensors. S.A.Al-Chalabi, B.Culshaw, D.E.N.Davies (Dept. of Electronic & Electrical Engng., Univ. Coll. London, London, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.132-5

Describes a system which is capable of measuring the state of remotely set interferometers which can be connected to the receiver via single mode optical fibres. The essence of the technique used is that a partially coherent optical source—such as a superluminescent diode—is used to illuminate the interferometer, which has to have a path length difference between its arms of at least one coherence length of the transmitted signal. The difference in the path lengths of the remote interferometer arms is measured at the receiver using another interferometer with a calibrated length (time) difference between its arms and the interferometric sensor system is configured such that all the transmitted power is utilized in the measurement. (3 refs.)

74528 Remote interferometric sensors using frequency modulated laser sources. D.Uttam, I.P.Gile, B.Culshaw, D.E.N.Davies (Dept. of Electronic & Electrical Engng., Univ. Coll. London, London, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.182-4

Most interferometric sensors are designed to use highly coherent optical sources for measurement of small phase deviations. The authors describe the use of a frequency modulated source to excite an interferometer. It is shown that it is possible to read the state of a totally passive, remotely located interferometer with great accuracy. Further it is shown that multiplexing of several cascaded sensors is possible using saw-tooth FM. Initial experimental results, from an air-path Michelson interferometer, are presented. (8 refs.)

74529 Performance characteristics of a passively stabilized fiber interferometer using a (3x3) fiber directional coupler. K.P.Koo, A.Dandridge, A.B.Tveten (Naval Res. Lab., Washington, DC, USA).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.200-4

In the field of fiber optic interferometry, there is increasing interest in passive stabilization schemes to overcome the signal fading problem inherent in the free running interferometer. The basic concept of the authors' passive detection schemes is to produce two optical signals from the interferometer with a $\pi/2$ phase difference, these may then be electronically processed to give a stable output. Recently, the authors have demonstrated such a passive stabilization scheme using a (3x3) fibre directional coupler (see Appl. Phys. Lett., vol.41, no.7, p.616, 1982). The authors now present additional results, relating the performance of such a passively stabilized system to the properties of the (3x3) fiber coupler and various parameters which govern the characteristics of the fiber interferometer. (3 refs.)

74530 Fiber-optic interferometric signal processor employing a differentiate and cross-multiply frequency discriminator. S.A.Kingsley (Batelle Columbus Labs., Columbus, OH, USA).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.205-9

Describes two passive homodyne detection techniques and a compact signal processing unit which the author is developing for the Naval Research Laboratory (NRL). By passive, the author means a system which does not require feedback either to the interferometer via a PZT transducer or to the laser. Both the systems described employ a 'phase generated carrier' technique. The prototype brassboarded unit which the author is building for NRL uses a new type of phase detector which is called a differentiate and cross-multiply frequency discriminator. (12 refs.)

07.60P Optical microscopy

74531 Scanning optical microscope incorporating a digital framestore and microcomputer. I.J.Cox, C.J.R.Sheppard (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).

Appl. Opt. (USA), vol.22, no.10, p.1474-78 (15 May 1983).

A scanning optical microscope is particularly well suited for image digitization since the image is already in the form of an electronic signal. A mechanically scanned optical microscope is described, which is controlled by a microcomputer and the image displayed on a framestore. The results of several simple digital image-processing algorithms applied to the micrographs are presented. (6 refs.)

74532 Temperature-controlled microscope with millidegree stability. H.Yokoyama, S.Kobayashi, H.Kamei (Materials Div., Electrotech. Lab., Ibaraki, Japan).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.611-12 (May 1983).

The authors constructed a simple polarizing microscope in which the sample temperature can be controlled with an accuracy of 10^{-3} °C from room temperature to about 60°C. The temperature stability at a sample was directly assessed using the temperature-dependent birefringence of a liquid-crystal sample. (5 refs.)

07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

74533 Electron-photon coincidence technique for the absolute calibration of VUV detectors. R.McAdams (Chem. Dept., Univ. of Southern California, Los Angeles, CA, USA), S.K.Srivastava.

Appl. Opt. (USA), vol.22, no.10, p.1551-4 (15 May 1983).

A method is described whereby VUV photon detectors can be accurately calibrated. This method is illustrated by taking the 58.4-nm transition of He as an example. The technique consists of crossing a monoenergetic electron beam with a beam of He atoms. When inelastically scattered electrons which have excited the 2^1P state are detected in coincidence with the 58.4-nm photons emitted in the decay of the excited state, the interaction volume formed by the crossed beams constitutes a standard source of photons. By comparing the number of detected coincidences with the predicted number the calibration can be made. A total detector efficiency of 0.024 ± 0.003 is obtained for a Galileo 4830 channeltron. (15 refs.)

74534 Picosecond CdSe photodetector. W.Margulis, W.Sibbett (Blackett Lab., Imperial Coll., London, England).

Appl. Phys. Lett. (USA), vol.42, no.11, p.975-7 (1 June 1983).

The performance of a photoconductive device in which an evaporated CdSe film is used as the semiconductor medium is described. The results indicate an ultrafast response and a recovery time ~ 20 ps. (11 refs.)

74535 New devices and materials for ultrafast high speed photodetectors for the ultraviolet through to the infrared. B.K.Garside, F.L.Gouin (Opto-Electronics Ltd., Oakville, Ontario, Canada).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.355, p.27-36 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982).

Recent developments in fiber optics and laser sources have emphasised the need for high efficiency semiconductor photodetectors responding at unprecedented speeds over an ever-expanding wavelength range. To meet these needs, new types of device structures and new materials are increasingly being explored. The influence of general device and material characteristics on device capability is discussed, and the limitations explained through the use of general, time-dependent detector models. Appropriate device structures and materials are discussed for the development of high quantum efficiency, fast detectors at wavelengths ranging from the ultraviolet through to the infrared region appropriate to future optical communications systems. Recent results using junction and modified Schottky barrier structures are described, and the development of new materials for detector applications in the visible and infrared spectral regions is discussed. (13 refs.)

74536 Pressure pulse in an infrared pneumatic detector: theory based on the Einstein coefficient for induced absorption. J.P.Gupta, R.N.Sachdev, K.G.Vohra (Air Monitoring Section, Bhabha Atomic Res. Centre, Bombay, India).

J. Appl. Phys. (USA), vol.54, no.5, p.2183-7 (May 1983).

The kinetics of gases due to absorption of infrared radiation on closed cells has been discussed with the use of the Einstein coefficient for emission and absorption of radiation. The expression derived for the magnitude of pressure pulse in the cell explains satisfactorily the observed characteristics of the pneumatic detector. (21 refs.)

07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

74537 System analysis and time delay spectrometry. I. H.Biering, O.Z.Pedersen.

Bruel & Kjaer Tech. Rev. (Denmark), no.1, p.3-51 (1983).

Time delay spectrometry (TDS) is a relatively new method for measurement of system response. Based on a linear sine sweep it optimizes measurement performance eliminating some earlier drawbacks of swept measurements. This method leads to adopting an identical complex description in the time and frequency domains. To fully utilize the benefits from this description it is essential to consider the general behaviour of two-port systems and the problems encountered in the measurement of these. The present part of the article is an overview of the theoretical foundation for analysis of linear and time invariant systems. (6 refs.)

74538 A broadband submillimeter wave spectrometer system with on-line microcomputer data analysis. E.Schafer, M.Winnewisser (Phys. Chem. Inst., Justus-Liebig-Universität, Giessen, Germany).

Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.4, p.327-34 (April 1983). A submillimeter wave spectrometer operating in the frequency range 100 to 800 GHz has been constructed for the study of transient molecules in the gas phase. The instrument employs harmonic generation of millimeter wave frequencies and a He-cooled InSb photoconducting detector. A high degree of flexibility is achieved using an exchangeable free-space Pyrex absorption cell and a microcomputer for on-line data analysis. The spectrometer can be operated in a free-running video mode together with a fast signal averager or phase-locked to a microwave reference with source modulation. It is shown that the reproducibility of line center frequency measurements up to 600 GHz is ± 10 kHz. Transitions with absorption coefficients of at least $3 \cdot 10^{-8}$ cm⁻¹

can be detected in the range from 150 to 250 GHz. Ground state rotational transitions of OCS between 200 and 690 GHz are reported and analysed. (35 refs.)

74539 An automated high resolution spectrometer with data system. L.Ramaley, S.C.Foster, J.A.Coxon (Dept. of Chem., Dalhousie Univ., Halifax, NS, Canada).

Chem. Biomed. & Environ. Instrum. (USA), vol.12, no.4, p.229-52 (1982-1983).

Describes a spectrometer used for recording rotationally-resolved spectra of small molecules. The spectrometer consists of a high resolution scanning monochromator and photon counting detector interfaced to a dedicated minicomputer. The interface is very versatile, providing operation in several modes with minimum demands on the computer. This allows the computer to run in a foreground-background mode in which data previously acquired can be analyzed or new software developed while simultaneously acquiring new data with almost complete invisibility. (12 refs.)

74540 Installation to determine the index of the heterogeneity of glass.

V.I.Shelyubskii, I.A.Megerdicheva.

Glass & Ceram. (USA), vol.39, no.5-6, p.271-4 (May-June 1982). Translation of: *Steklo & Keram. (USSR)*, vol.39, no.6, p.9-10 (June 1982). [received: March 1983]

A method of quantitative determination of the index of the heterogeneity of glass based on variation of scattering of a parallel beam of monochromatic light by fine glass powder in an immersion liquid with small temperature variations was proposed earlier (V.I. Shelyubskii 1969). To accelerate introduction of the method into plant practice, the authors developed a simple installation based on the standard SF-10 spectrophotometer, in which a considerable part of measuring the heterogeneity has been automated. The installation permits one to make measurements at any wavelengths. Similar auxiliary assemblies can be used in spectrophotometers of other types. (4 refs.)

74541 Anisotropy of nonresonant cubic susceptibility in three-frequency active spectroscopy of Raman scattering. V.V.Kvach, V.P.Kozich, V.A.Orlovich.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.913-15 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.247-9 (Aug. 1982). [received: April 1983]

The methods of active spectroscopy of Raman scattering (ASRS) permit investigating nonlinear cubic susceptibility $\chi_{ijk}^{(3)}$ ($\nu_1, \nu_2, -\nu_3$), which determines the generation of radiation of frequency $\nu_3 = \nu_1 + \nu_2 - \nu_3$ under the action on a medium of fluxes with frequencies ν_1, ν_2 , and ν_3 (ν_2 and ν_3 are the frequencies of biharmonic pumping, and ν_1 is the frequency of the probe wave). When these methods are used spectroscopically, the susceptibility consists, as a rule, of a resonant part $\chi_{ijk}^{(3)R}$, which takes into account the contribution of the vibration (transition) under investigation to the ASRS signal, and a nonresonant part $\chi_{ijk}^{(3)NR}$, which is caused by all the other processes in the medium and which forms an undesirable background signal. A simple method is proposed for the measurement of the anisotropy of nonresonant cubic susceptibility in a three-frequency ASRS scheme ($\nu_1 \neq \nu_2 \neq \nu_3$). (7 refs.)

74542 10-Hz coherence anti-Stokes Raman spectroscopy apparatus for turbulent combustion studies. L.P.Goss, D.D.Trump, B.G.MacDonald, G.L.Switzer (Systems Res. Labs. Inc., Dayton, OH, USA).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.563-71 (May 1983).

A 10-Hz coherent anti-Stokes Raman spectroscopy (CARS) instrument capable of simultaneous thermometry and N_2 concentration measurements in a turbulent flame has been designed and constructed and is described in detail. The instrument employs the doubled output of a pulsed Nd:YAG laser for pumping a broadband dye laser and also for the CARS pump beam. The broadband dye laser is used to excite, during a single pulse, the entire Q Branch of N_2 , the CARS signal of which is recorded by a multichannel analyzer. Special problems which were encountered with the multichannel analyzer include signal retention and limited dynamic range. The former was greatly reduced by employing cleansing scans between laser firings, and the latter was circumvented by employing a multiple beamsplitter arrangement in which the CARS signal was divided into four separate intensity regions, each of which covered a specific temperature range. The 10-Hz operation of the instrument required the use of a mass storage device such as an 800-bits-per-inch tape. CARS data recorded and digitized by the multichannel analyzer were transferred via machine-coded instructions to a minicomputer for storage on tape. Analysis of the CARS data consisted of a nonlinear least-squares fit of the CARS bandshape for thermometry and integration of the CARS signal for N_2 concentrations. CARS measurements in a near-stoichiometric premixed propane flame and a turbulent diffusion flame are reported. Results of calibration measurements indicate that uncertainties of 4% in temperature and 6% in concentration are obtainable with this instrument. (28 refs.)

74543 An automatic microcomputer-based system for measuring reaction rates by UV spectroscopy. H.Maskill, J.T.Thompson (Chem. Dept., Univ. of Stirling, Stirling, Scotland).

Lab. Microcomput. (GB), vol.1, no.1, p.11-14 (Spring 1982).

Describes a microcomputer-based system for analysing UV absorption spectra to give chemical reaction rates. The system is based on a Pye Unicam SP8-300 double beam UV spectrophotometer with cell-changer and an Apple II microcomputer fitted with a clock, single disc drive and Hitachi monitor. The cell changer can be controlled by the Apple. (no refs.)

74544 An electron-retardation device to improve the resolution of a Turner-type UV photoelectron spectrometer. R.Dressler, L.Neuhaus, M.Allan (Inst. de Chimie Phys., Univ. Perolles, Fribourg, Switzerland).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.2, p.181-9 (May 1983).

A simple pre-retardation device without intermediate images that may be used to increase the resolution of Turner-type UV photoelectron spectrometers has been analyzed by means of electron trajectory calculations. A set of qualitative rules based on the calculations as well as performance tests of the actual device are presented. High-resolution spectra of naphthalene and anthracene are presented as an illustration and compared in detail with recent model calculations of Franck-Condon profiles by Ohno (1979). (11 refs.)

- 74550** Reverse or negative bluescreen traveling matte process. J.Erland (Apogee Inc., Van Nuys, CA, USA). *SMPTE J. (USA)*, vol.92, no.3, p.268-75 (March 1983).
This article outlines a new approach to the production of motion picture traveling matte photography. A solution is demonstrated to overcome the problems encountered when photographing models, i.e. aircraft, space ships, etc., when these incorporate surface finishes such as specular metallic or glossy paint, or when they include thin sections such as struts or antennae. The process requires a sophisticated motion control system capable of multiple passes in registration. (no refs.)
- 74551** IMAX and OMNIMAX theatre design. W.C.Shaw, J.C.Douglas (Imax Systems Corp., Oakville, Ontario, Canada). *SMPTE J. (USA)*, vol.92, no.3, p.284-90 (March 1983).
Theatre design for both IMAX and OMNIMAX presentations opens up a variety of new possibilities and presents a host of problems, some old, and many new. Many traditional concepts of theatre design, such as clear sightlines to the bottom of the screen, are no longer justified, or even desirable. Conversely, because of the large included angles in the projection beam, projector light-ray clearances become critical at many points in the auditorium. Audience movement and safety are important factors, and several unusual concepts are discussed. Since most IMAX and OMNIMAX theatres are in new construction, there are unique opportunities to optimize the audience environment, including picture, sound, and acoustics. Existing IMAX theatres range in size from 120 to 980 seats, with 1400 seats projected. OMNIMAX theatres range from 94 to 380, with larger theatres in the planning stage. (6 refs.)
- 74552** The interface of color negative film and telecine. K.Staes, W.Markie. *SMPTE J. (USA)*, vol.92, no.3, p.303-7 (March 1983).
This article discusses the interface between color negative film and telecine systems, reviewing basic facts about the negative-positive process, and the spectral responses of telecines and color print film. Figures and equations are provided in a discussion of appropriate interface corrections in color reproduction using different films with different telecines. The article gives details of a telecine alignment that provides a reproducible, easy-handling method yielding excellent color reproduction quality. (2 refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

- 74553** A combination field desorption/fast atom bombardment source for the MS-50 mass spectrometer. G.Hansen, D.Heller, J.Yergey, R.J.Cotter, C.Fensclau (Dept. of Pharmacology, Johns Hopkins Univ. School of Medicine, Baltimore, MD, USA). *Chem. Biomed. & Environ. Instrum. (USA)*, vol.12, no.4, p.275-88 (1982-1983).
Conversion of the combination EI/FD source supplied by Kratos for the MS-50 mass spectrometer to a combination FD/FAB source is described. Sensitivities in the combination source are equivalent to those of the stand alone FAB source supplied by Kratos and the EI/FD source. Some compounds could be analyzed by FAB only, others by FD only and a third group were susceptible to both techniques. The advantage of the combination source is that both techniques may be used without having to change ion sources or perform extensive instrumental manipulations. (11 refs.)
- 74554** Automation of a gas analyser by personal computer. J.Canteloup, J.P.Vassilakis (Lab. d'Etudes des Procédés d'Analyse Phys., IUT, Orsay, France). *Mes. Regul. Autom. (France)*, vol.48, no.8, p.29, 31-2 (16 May 1983). In French.
A microcomputer-controlled quadrupole mass spectrometer for quantitative analysis of the gaseous phase in modern vacuum treatment processes is presented. Its three main components (an ionisation chamber, an ion-separating quadrupole filter and an electron multiplier) are supplied and controlled from an electronics package. The automation of signal acquisition, digitised spectrum storage and restitution after processing, and spectral analysis is explained. Programs for spectrum acquisition and analysis, and monitoring of peripherals including calibration of converters and multiplexer and switching of relays, are mentioned. An example of an experiment with a Riber QX100 quadrupole spectrometer and Apple II Plus microcomputer is described, and spectra obtained for Ar in Ne are presented. (no refs.) M.B.D.

- ## 07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS
- (see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)
- 74555** Apparatus for measurements on the fragmentation of MeV molecular-ion beams. B.J.Zabransky, P.J.Cooney, D.S.Gemmel, E.P.Kanter, Z.Vager (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.5, p.531-40 (May 1983).
An apparatus for the study of the fragmentation of MeV molecular ions is described. The system permits high-resolution measurement of the joint distribution in energy and angle for fragment ions of selected charge and mass. Two movable detectors allow the study of spatial and temporal correlations among up to three fragments resulting from a single dissociation event. All experimental parameters are monitored, controlled, displayed, and recorded by a computer system that uses a linked network of four processors. Real-time, computer-generated color graphics, are employed to give a visual rendition of the relation between the detector positions and the trajectories of outgoing fragments. (23 refs.)
- 74556** Angular resolution in total cross-section measurements. I.Lazzizzera (Dept. of Phys., Univ. of Trento, Trento, Italy), A.Zecca. *Rev. Sci. Instrum. (USA)*, vol.54, no.5, p.541-3 (May 1983).
This paper deals with the calculation of the detection efficiency in total cross-section measurements for two geometries: rectangular beam-rectangular detector of equal (finite) dimensions and circular beam-circular detector. The solutions are given in analytical and graphical form. The use of the term 'angular resolution' is discussed and a new definition is proposed. (3 refs.)

- (see also in condensed matter 61.16D Electron microscopy, 61.16F Field ion microscopy)
- 74557** Net grating and the testing of magnification in the TEM. Chen Hsiang-chen, Yin Sen-Yu (Shanghai Optical Instrument Res. Inst., Shanghai, China). *Chin. J. Sci. Instrum. (China)*, vol.4, no.1, p.9-14 (Feb. 1983). In Chinese.
The testing and determining of magnification for TEM is a fundamental testing technique in the transmission electron microscope (TEM). A simple

method of testing the groove-spacing of the gratings and replicas by means of a conventional microscope is described and errors encountered are statistically evaluated. (5 refs.)

74558 Clamping device for surface electron microscope samples with background neutralization. L.-A.Gang. *Feinwerktech. & Messtech. (Germany)*, vol.91, no.3, p.107-8 (April-May 1983). In German.

With the flexible clamping devices described, samples differing in structure, material and geometry can be quickly and simply placed in the beam path of the surface electron microscope. A screen attached to the clamping device permits neutralization of disturbing background appearances. (no refs.)

74559 AES investigation of silicon nitride film. Dai Dao-xuan, Ling Rong-fu, Wang Ji-tao, Wang De-xin, Dong Xi-wei, Luo Xing-hua. *Fudan J. (China)*, vol.21, no.4, p.468-73 (Dec. 1982). In Chinese. [received: June 1983]

The composition profiles of LPCVD silicon nitride films on silicon dioxide have been measured by AES using a PHI-550 type electron spectrometer. The Auger peak lines in nitride/silicon dioxide interface transition region have also been taken. The chemical compositions in the interface region have been analysed. (10 refs.)

74560 A modified bias-method for the determination of spectrometer functions. H.Ebel, G.Zuba, M.F.Ebel (Inst. für Angewandte und Tech. Phys., Tech. Univ. Wien, Wien, Austria). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.31, no.2, p.123-30 (May 1983).

The results of quantitative surface analysis by means of X-ray photoelectron spectroscopy show a marked influence of the spectrometer function of the instrument employed. For an instrument without retardation and electron lenses the spectrometer function can be calculated, but for a more sophisticated type of instrument experimental determination of the spectrometer function is indispensable. In this paper a suitable method (variation of the bias) is described, which furthermore offers a possibility of checking the results. (3 refs.)

74561 Recent improvements to the Cambridge University 600 kV high resolution electron microscope. D.J.Smith, R.A.Camps, L.A.Freeman (High Resolution Electron Microscope, Univ. of Cambridge, Cambridge, England), R.Hill, W.C.Nixon, K.C.A.Smith.

J. Microsc. (GB), vol.130, pt.2, p.127-36 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982). Several recent modifications to the Cambridge University 600 kV HREM have resulted in increased levels of performance and greater operating efficiency. Changes include new Permenur pole-pieces with a reduced gap leading to improved aberration coefficients, and an attachment to the tilt/shift supplies which facilitates accurate beam alignment. Resolution figures include: (a) an axial CTF extending, without zeros, beyond 1.8 Å at 575 kV; (b) tilted beam CTFs extending beyond 1.1 Å; and (c) lattice fringes of 0.72 Å spacing. (24 refs.)

74562 Procedures for focusing, stigmating and alignment in high resolution electron microscopy. W.O.Saxton, D.J.Smith (High Resolution Electron Microscope, Univ. of Cambridge, Cambridge, England), S.J.Erasmus.

J. Microsc. (GB), vol.130, pt.2, p.187-201 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982). Several different approaches to the alignment, stigmating and focusing of a high resolution electron microscope are evaluated theoretically and experimentally. Ambiguities in the interpretation of diffractograms are pointed out which make it necessary to explore a range of incident beam directions before the correct alignment can be established. The variation of image contrast with the imaging conditions is examined in detail, and its global minimization is shown to be a reliable criteria for adjustment of all parameters. Recommendations are made as to the best procedures to adopt in various circumstances, and a computer-controlled procedure based on the image contrast is described which sets all parameters automatically in less than a minute. (37 refs.)

74563 Morphological SEM picture processing. D.Jeuin (Inst. de Recherches de la Siderurgie Française, Maizières-les-Metz, France).

J. Microsc. & Spectrosc. Electron. (France), vol.8, no.1, p.1-18 (Feb. 1983). A new system of quantitative image analysis of SEM images was developed in IRSID. It combines a SEM under the control of an EDS micro-analyzer with a scan generator, a microcomputer, and a texture analyzer. Morphological picture transformations are implemented on different kinds of data (digital or threshold electron images or X-ray maps) in order to make automatic image segmentation and to get quantitative morphological and chemical data on material microstructures. Position of the SEM beam on sample may be controlled by processed binary pictures for automatic local X-ray spectra or maps acquisitions. (39 refs.)

74564 Automatic electron probe microanalyser based on double measurement of dose. C.Marion, M.Vannier (Ecole des Mines de Paris, Centre de Géologie Générale et Minière, Fontainebleau, France).

J. Microsc. & Spectrosc. Electron. (France), vol.8, no.1, p.31-46 (Feb. 1983). In French. The automation of quantitative analysis using a wave dispersive spectrometer microprobe requires a high accuracy in the motions of the spectrometer. A new method, based on a double measurement of X-rays intensities on each side of the peak instead of one measurement on top is presented. This method allows a better analytical reproducibility and a permanent control of the working order of the spectrometers. (3 refs.)

74565 Electron microscope grid holders for a multipurpose specimen stage. C.E.Warble (CSIRO Div. of Chem. Phys., Clayton, Victoria, Australia).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.607-10 (May 1983). In this article improved grid holders for use in a multipurpose electron microscope stage are described. Two models, made from copper, bronze, or brass, both allowing cooling and tilting, provide either (1) a heating capability with the grid in a strip configuration or (2) a full-circle grid without the heating facility. The mechanical stability, electrical, thermal, and anticontamination characteristics, and tilt movements are excellent. (3 refs.)

74566 Dependence of the maximum magnetic induction and half-width of the field of electron-microscope lenses on the shape and material of the pole pieces. S.F.Zelev.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.557-9 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.20-2 (Sept. 1982).

The dependence of the maximum magnetic induction B_0 and the half-width d of the field of electron-microscope electromagnetic lenses on the shape parameters $p=s/b$ of the pole pieces has been investigated, taking into account the materials that are usually used for them in Soviet electron microscopes (K50F2 Permenur, 50N and 79NM Permalloy). Graphs are presented that illustrate this dependence and are convenient to use for practical calculations of electromagnetic lenses. (3 refs.)

07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

74567 The cobalt 60 radiation equipment of Seibersdorf Research Centre. K.Mayr, G.Nezavdal, K.Spalek (Österreichisches Forschungszentrum Seibersdorf GmbH, Seibersdorf, Austria).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.443-54 (1982). In German. [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Győr, Hungary, 28 Sept.-1 Oct. 1981). Describes the ^{60}Co irradiation equipment of Seibersdorf (Austria) Research Center, now expanded to 4.1 Peta-Becquerel (3.7 Peta-Becquerel for industrial purposes, 0.44 for scientific purposes: biology, radiation chemistry). The screening system, transport arrangements, controls and fire fighting system are described in detail. (no refs.) J.S.

74568 X-ray spectrograph design. M.P.Chrisp (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Appl. Opt. (USA), vol.22, no.10, p.1519-29 (15 May 1983). An aberration theory is applied to spectrograph design. The initial system considered has a toroidal mirror in front of a concave grating spectrograph giving spatial resolution perpendicular to the dispersion direction. The accuracy of the theory is shown by comparison of spot diagrams obtained from the aberrations with those produced by raytracing. The major aberrations affecting the vignetting at the intermediate slit and the spatial resolution are identified. A new system, using a holographic grating to give a flat focal plane, is then designed and optimized. It has increased spatial resolution over the wavelength range and is particularly suitable for microchannel array detectors. (8 refs.)

74569 Computer evaluation of real-time X-ray and acoustic images. M.H.Jacoby, R.S.Loe, P.A.Dondes (Lockheed Missiles & Space Co. Inc., Sunnyvale, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.359, p.273-7 (1983). (Applications of Digital Image Processing IV, San Diego, CA, USA, 24-27 Aug. 1982). The weakest link in the inspection process is the subjective interpretation of data by inspectors. To overcome this troublesome fact computer based analysis systems have been developed. In the field of nondestructive evaluation (NDE) there is a large class of inspections that can benefit from computer analysis. X-ray images (both film and fluoroscopic) and acoustic images lend themselves to automatic analysis as do the one-dimensional signals associated with ultrasonic, eddy current and acoustic emission testing. Computer analysis can enhance and evaluate subtle details. Flaws can be located and measured, and acceptance decisions made by computer in a consistent and objective manner. The authors describe the interactive, computer-based analysis of real-time X-ray images and acoustic images of graphite/epoxy adhesively bonded structures. (11 refs.)

74570 Data acquisition and analysis in X-ray photoelectron spectroscopy using an Apple II microcomputer. A.F.Carley (Chem. Dept., Univ. Coll., Cardiff, Wales).

Lab. Microcomput. (GB), vol.1, no.2, p.8-13 (Summer 1982). Describes the author's system for automated X-ray photoelectron spectroscopy. Hardware described includes: Apple II microcomputer; 2 channel 12-bit D/A converter and 8-bit parallel port; 4 channel 12-bit A/D converter; parallel interface card; clock/calendar card; ROM+ card with keyboard filter ROM; disc drive interface. Also discussed is the software used for data acquisition and data analysis. (no refs.)

74571 An economical transfer vessel with detachable reactor for XPS studies. T.P.Debies, D.M.Schrall (Gulf Res. & Dev. Co., Pittsburgh, PA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.2, p.191-6 (May 1983). The authors describe an economical transfer vessel with a detachable reactor for the performance of chemical reactions. The device was designed for use in combination with the Physical Electronics Model 550 ESCA/SAM/SIMS instrument, but can be modified for use with other spectrometers. (8 refs.)

74572 Gamma-reflection densitometer for the qualification of concrete shielding. B.Szepessy (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.145-52 (1982). A gamma-reflection densitometer had been developed by the author. By analysis the gamma-spectra conclusions can be drawn about the inclusions in the concrete concerning their size and their depth. The device can be used in industry or other fields too. (5 refs.)

74573 Simple quasi-two-crystal X-ray spectrometer. K.Taniguchi (Dept. of Solid-State Electronics, Faculty of Engng., Osaka Electro-Communication Univ., Osaka, Japan).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.559-62 (May 1983). A simple two-crystal spectrometer was constructed using a commercial single-crystal spectrometer, i.e. the second crystal and the detector were attached on the 2θ arm of a single-crystal spectrometer. The angle between the second crystal and the detector is preset to an optimum angle for the measurement region of interest. The condition for geometrically ideal analysis can be satisfied by rotating the θ axis and detector arm (2θ arm) at a rotation ratio of 1:3 using an external pair of gears whose ratio is 3:1. The wavelength can be directly read according to Bragg's diffraction law, like a commercial two-crystal spectrometer. The author measured sulphur-K β spectra for several sulphur compounds. It is concluded, from several measurements, that the spectra obtained with a high-resolution can be an important and powerful tool for the study of the valence band and can also be applied to chemical-state analysis. (4 refs.)

74574 Use of carbon felt as a cold cathode for a pulsed line X-ray source operated at high repetition rates. G.F.Erickson, P.N.Mace (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.586-90 (May 1983). Tests to determine the usefulness of carbon felt as a cold cathode in high repetition rate X-ray systems are described. Application of these test results to design and operation of an X-ray preionizer for an excimer laser system

has resulted in a simple, reliable X-ray source which can be used at pulse rates up to 500 Hz for $>2 \times 10^7$ shots before the carbon felt must be replaced. (4 refs.)

74575 Radiation image converters for industrial introsopes. E.A.Gusev, B.I.Leonov, F.N.Novitskii (Sci.-Res. Inst. of Introscopy, Moscow, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.669-71 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.4-7 (Sept. 1982). Methods of visualizing the fields of penetrating radiations are examined and the advantages of converters with rare-earth elements and polycrystals of alkali-halogen compounds are pointed out. The possibilities of modern converters are shown and their comparative analysis is given. (8 refs.)

74576 X-ray lithography with a plasma-point source of soft X-radiation. V.A.Veretennikov, A.N.Dolgov, A.I.Isakov, V.L.Kantsyrev, O.N.Krokhin, A.P.Nekunde, O.V.Sagalovskaya, O.G.Semenov, Yu.V.Sidel'nikov, V.V.Ul'yanov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.9, p.448-9 (Sept. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1041-5 (Sept. 1982). [received: May 1983]

One of the major problems in the development of X-ray lithography is to produce a small, highly efficient, easily serviced source of soft X-radiation with an acceptable spectrum. Generally acknowledged as candidate sources for X-ray lithography are X-ray tubes with a rotating anode, synchrotron radiation sources, and laser-plasma sources. Each of these sources has its own advantages and disadvantages, which determine its practical value. The authors used a vacuum-spark apparatus as a plasma source. (15 refs.)

74577 Installation and commissioning of a Siemens SRS200 sequential X-ray-fluorescence spectrometer. A.M.E.Balacs, J.J.Jacobs. *Report M80*, Council for Miner. Technol., Randburg, S. Africa (25 Feb. 1983). 6 pp.

The operation of the Siemens SRS200 automatic X-ray spectrometer, which can also be operated manually, is described. Details of its application to routine analysis are given, and these demonstrate its high level of performance, even in the analysis of elements present in part-per-million concentrations. Modifications that were made to the sample cups and the installation of a nondedicated computer are discussed. (2 refs.)

74578 Nucleonic techniques for non-invasive, on-line measurement [industrial applications]. D.W.Neild (Salford Electrical Instruments Ltd., Eccles, England).

Colloquium on 'Non-Invasive On-Line Measurement in Industry', London, England, 13 April 1983 (London, England: IEE 1983), p.2/1-7

The word 'nucleonic' is intended to encompass gamma radiation in the energy range 40 KeV to 2.5 MeV (neutrons are not dealt with). The more conventional gamma absorption and 'back scatter' measurement systems are first considered and their disadvantages are outlined 'low-level' systems which are capable of replacing them in many applications are then discussed. 'Low level' gamma radiation is interpreted as implying a gamma flux rate of less than 0.75 milliroentgens/hour (7.5 μ Sv/hr). (no refs.)

07.90 OTHER TOPICS IN SPECIALISED INSTRUMENTATION

74579 Analysis of precision in determination of diffusion coefficients by the isotope exchange technique. M.Nanba, Y.Oishi, K.Ando (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan). *Mem. Fac. Eng. Kyushu Univ. (Japan)*, vol.42, no.4, p.245-50 (Dec. 1982). [received: May 1983]

The precision of diffusion coefficients determined by the gas-solid isotope exchange technique was analysed for the case where planar sheet diffusion is rate-controlled by the isotope exchange reaction. An objective function was employed to estimate the degree of fitting of the theoretical calculation to the experimental diffusion profile as a function of the sample size (l), the diffusion coefficient (D), the surface exchange coefficient (K), and the atoms in the gas and solid phases. The results indicated that the diffusion coefficient could be determined to a high degree of precision when (Kl/D) is greater than 1 and that with this condition satisfied, the precision of the determined diffusion coefficient increased with increased diffusion times. (6 refs.)

11.10 FIELD THEORY

74580 Properties of the vacuum. I. Mechanical and thermodynamic. J.Ambjorn, S.Wolfram (Dept. of Phys., California Inst. of Technol., Pasadena, CA, USA).

Ann. Phys. (USA), vol.147, no.1, p.1-32 (15 April 1983).

Casimir energies are calculated for quantized fields in cavities with a variety of forms. Consequences for models of the vacuum state are considered. The possibility of negative mass systems is discussed. Results on energy and entropy of finite quantum systems at non-zero temperature is given. (50 refs.)

74581 Fock space construction of the massless dipole field. A.Z.Capri, G.Grubl, R.Kobes (Theoretical Phys. Inst., Univ. of Alberta, Edmonton, Alberta, Canada).

Ann. Phys. (USA), vol.147, no.1, p.140-70 (15 April 1983).

The authors construct the Fock space representation of the free massless scalar dipole field in terms of creation and annihilation operators for the eigenvectors of the momentum operator. The Poincare group is implemented unitarily only on a subspace of the full (positive metric) Hilbert space. The subspace possess a Hermitean, local, irreducible scalar field constructed out of the (non-hermitean) dipole field. Thus this subspace is a perfect candidate for a physical subspace of observable particles. They show that this possibility is however excluded by the fact that these particles interact with an external c -number source in a manner that violates unitarity. They illustrate the construction by applying it to the linearized Higgs model with external c -number source and examine the (non-trivial) dynamics of the dipole degrees of freedom in this case. An explicit separation of the physical degrees of freedom from the unphysical ones is presented for this interacting model. (11 refs.)

74582 A microscopic theory of the Lambda transition. II. T.Toyoda (Inst. fur Theoretische Phys., Univ. Tübingen, Tübingen, Germany).

Ann. Phys. (USA), vol.147, no.1, p.244-66 (15 April 1983).

For pt.1 see *ibid.*, vol.141, p.154, (1982). The previously proposed finite temperature field theory of the lambda transition based on the Schwinger functional method is investigated further. A systematic method for calculating the higher-order loop terms is presented by introducing the one-loop Green's functions, which are found to be a natural finite temperature extension of the Beliaev-Hugenholtz-Pines-Gavoret-Noziers zero-temperature Green's functions. The application of the finite temperature loop expansion to the dynamical properties is presented by calculating the retarded density correlation functions at the one-loop level. The result gives a microscopic basis for the form of the dynamical structure factor recently proposed by Woods and Svensson (1978). From a general point of view, without using any approximations or model interactions. Goldstone's theorem for the lambda transition at finite temperature is presented. (24 refs.)

74583 A study of CP^{n-1} models on the sphere within the $1/n$ expansion. G.Munster (Inst. fur Theoretische Phys., Univ. Bern, Bern, Switzerland). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.1-31 (30 May 1983).

Two-dimensional CP^{n-1} models are considered within the $1/n$ expansion. Space-time is taken to be a sphere, which provides an infrared cut-off. In a sector with fixed topological charge the leading term of the $1/n$ expansion of the partition function is calculated exactly and its volume dependence is studied. In the limit of small volume it approaches the semiclassical instanton contribution. For large volumes it represents a flat Gaussian distribution of topological charge number. The large- n and large volume limits do not commute. (25 refs.)

74584 'Heating the quenched Eguchi-Kawai model. F.R.Klinkhamer (Leiden Obs., Leiden, Netherlands).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.1, p.32-42 (30 May 1983).

Considers the Eguchi-Kawai reduction, in the momentum-quenched prescription, of the $SU(N)$ lattice gauge theory for $N \rightarrow \infty$ and address the problem of how finite temperature might be incorporated. This is of interest in order to establish quark deconfinement at high temperatures. The author also shows that different procedures may be inequivalent. (33 refs.)

74585 A model regularizing gauge fields in the strong coupling region. J.M.Drouffe (CERN, Geneva, Switzerland).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.1, p.89-109 (30 May 1983).

Proposes a model using an effective lagrangian for bilocal gauge extended fields, looking somehow as an average over all open strings with fixed end points. The locality of the action is retrieved as a range parameter, which acts as a regulator, shrinks, and the Yang-Mills theory is recovered in this limit. The system is invariant by rotation and translation, generalizes lattice gauge theories and allows regularized strong coupling expansions for Yang-Mills field theory. (9 refs.)

74586 Superfield formalism for gauge theories with ghosts and gauge fixing terms from dynamics on superspace. J.Hoyos, M.Quiros, J.Ramirez Mittelbrunn, F.J.de Urries (Inst. de Estructura de la Materia, Madrid, Spain). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.159-72 (30 May 1983).

The geometrical condition of soul-flatness needed in the superfield approach to quantized gauge theories and extended BRS transformations, is derived from a lagrangian theory on a superspace $S^{4,2}$. Invariance of the superlagrangian and the lagrangian of quantized gauge theories under $Sp(2,R)$ and hermitian conjugation is discussed in different gauges. (18 refs.)

74587 Quantum meaning of classical (field) theory for Fermi systems. P.Garbaczewski (School of Theoretical Phys., Dublin Inst. for Advanced Studies, Dublin, Ireland).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.2, p.321-32 (6 June 1983).

The author gives a path integral reconstruction of two quantum problems: the Fermi oscillator and the chiral invariant Gross-Neveu model. Integrations are carried out with respect to genuine (i.e. c-number, non-Grassmann) paths, so that one is able to identify explicitly contributions of the c-number classical models to the transition amplitudes of their quantized Fermi partners. Stationarity 'points' of the respective actions are verified to coincide with the classical trajectories: of the classical oscillator and of the classical chiral invariant Gross-Neveu field. (21 refs.)

74588 Superspace formulation of supersymmetric gauge theories in 4 and 10 dimensions. M.Tonin (Istituto di Fisica, Univ. di Padova, Padova, Italy).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.2, p.366-80 (6 June 1983).

A first-order superspace Lagrangian formulation of supersymmetric Yang-Mills theories in 4 dimensions, proposed in a previous paper (1983) is extended to 10 dimensions. Moreover, a new Lagrangian density, obtained through the removal of some, but not all, of the auxiliary fields, is considered and investigated. In particular, its superconformal properties are discussed. (21 refs.)

74589 Dynamical symmetry breaking in models of spinor fields with quartic interactions in (1+1) dimensions. Wang Rhung-tai, Ni Guang-jiong (Dept. of Phys., Fudan Univ., China).

Commun. Theor. Phys. (China), vol.1, no.4, p.469-83 (1982).

A nonperturbative method, namely, variational method together with canonical transformations, is developed to study dynamical symmetry breaking. This method has been applied in the models of two dimensional massless fermion fields with quartic interactions. The results imply that the mechanism of dynamical symmetry breaking bears some analogy to the phenomenon of superconductivity. The new vacuum $|\bar{O}\rangle$ is just a relativistic BCS ground state. In this vacuum $|\bar{O}\rangle$, one can observe a quasi-particle with mass M_F . Furthermore, correlative vacuum $|\bar{O}\rangle$ exists and the mesons emerge with masses O and $2M_F$. It is also shown that dynamical symmetry breaking always occurs in the models with infrared slavery and asymptotic freedom, while it is meaningless to discuss dynamical symmetry breaking in infrared stable theory. (11 refs.)

74590 Noether analysis and infinitely conserved currents in super-chiral model. Feng Yuan-ping, Ge Mo-lin (Lanzhou Univ., Lanzhou, China).

Commun. Theor. Phys. (China), vol.1, no.4, p.485-93 (1982).

A systematic procedure in writing down the infinite set of nonlocal conserved currents for a super-chiral model is given via Noether analysis. The first three conserved currents are explicitly shown. (10 refs.)

74591 Connection theory of fibre bundle and prolongation structures of nonlinear evolution equations. Guo Han-ying, Hsiang Yan-yu, Wu Ke (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.4, p.495-505 (1982).

It is shown that the proper geometrical framework for the nonlinear evolution equations (NEEs) and the soliton equations should be the fibre bundle theory, the principal bundle and its associated bundle and their connection theory. Based upon the requirement of covariance of the geometrical quantities, a covariant generic geometry theory for the prolongation structures of the NEEs is proposed and the fundamental equations for the prolongation structures are presented. The prolongation structure of the MKdV equation is concretely worked out by means of the covariant theory of the prolongation structure. (16 refs.)

74592 Geometric formulation of the indirect analytic representation of dynamical systems, exterior differential calculus on Banach spaces and variational selfadjointness. R.Trostel (Inst. fur Theoretische Phys., Tech. Univ. Berlin, Berlin, Germany).

Hadronic J. (USA), vol.6, no.2, p.305-405 (March 1983).

The exterior variational calculus is briefly reviewed and precised using, for example, Lang's exterior differential calculus on Banach spaces. Using this framework, a generalized Lemma of Poincare is proved and boundary terms are treated by using new equivalence relations compatible with the exterior differentiation and the respective Poincare-operator. Variational selfadjointness is defined using such equivalence relations comprising automatically Newtonian gauges. The most abstract way to define the indirect analytic representation is achieved by using another equivalence relation among physical 1-forms. As physics is primarily concerned with the solution of evolution equations, i.e. with finding the set of zeros of the physical 1-form, all those 1-forms of which the sets of zeros coincide are called equivalent. Within such an equivalence class, two physical 1-forms are called in genotopic (isotopic) relation to each other if one (both) of them is (are) variationally selfadjoint. The condition equations for isotopic or genotopic relations among 1-forms are derived and specified in the case of linear relationships. The author proves another theorem of the direct Lagrangian universality for all of those systems of which the evolution is C^n [t_0, t_1] ($n \geq 1$). (38 refs.)

74593 Decoupling theorem of quantum field theory in Minkowski space. E.B.Manoukian (Royal Military Coll. of Canada, Kingston, Ontario, Canada).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.315-21 (April 1983).

The decoupling theorem of quantum field theory with massive particles is proved in Minkowski space when all the masses of the theory are led to go to infinity. The theorem establishes the vanishing property, in the distributional sense, of (absolutely convergent) Feynman amplitudes in a model independent way with subtractions performed at the origin. This extends previous efforts dealing with the proof of the theorem in the Euclidean region. (17 refs.)

74594 Dirac-Schwinger commutation relations on a lattice. A.Peres (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.355-7 (April 1983).

Low-frequency excitations of a one-dimensional chain of oscillators propagate like waves with a uniform velocity. Therefore this lattice is Lorentz invariant on a macroscopic scale. The Dirac-Schwinger commutation relations are constructed explicitly and shown to have the correct limit for long wavelengths. A similar test could be used to check the Lorentz invariance of lattice field theories. (13 refs.)

74595 Mechanism by which spatially homogeneous Yang-Mills fields become stochastic. A.R.Avakyun, S.G.Arutyunyan, G.Z.Baseyan.

JETP Lett. (USA), vol.36, no.10, p.451-4 (20 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.10, p.372-4 (20 Nov. 1982). [received: June 1983]

A mechanical system with a nonzero angular momentum, corresponding to spatially homogeneous Yang-Mills fields, is analyzed. Numerical simulations have been carried out. A mechanism by which the fields become stochastic is found. (5 refs.)

74596 Renormalisation of the Fayet-Iliopoulos term in supersymmetric spontaneously broken U(1) gauge theories. T.R.Govindarajan (Phys. Dept., Indian Inst. of Technol., Kanpur, India), R.K.Kaul, B.Vijayalakshmi.

J. Phys. G (GB), vol.9, no.6, p.L103-6 (June 1983).

It is shown that the Fayet-Iliopoulos D term in $N=1$ supersymmetric spontaneously broken U(1) gauge theories may get one-loop corrections, even when trace U(1) charges are zero. However, these corrections are only logarithmically divergent and hence do not affect the naturalness of the theory. (9 refs.)

74597 On the covariant gauge parameter and the renormalisation group. R.D.C.Miller (CERN, Geneva, Switzerland).

J. Phys. G (GB), vol.9, no.6, p.595-603 (June 1983).

In a standard formulation of the renormalisation group (RG) a renormalised covariant gauge parameter is just as much a running parameter as are couplings and masses. In the past, by working in the Landau gauge, issues associated with a running covariant gauge parameter have largely been avoided. The present author looks at the main consequences of maintaining a general covariant gauge. He also reviews Gross' fixed gauge RG (1976) in which there has been renewed interest. For physical amplitudes this provides a simpler alternative to the standard RG. However, he shows that the fixed gauge RG invariants are in fact gauge dependent. Finally he points out that the Celmaster-Gonsalves relation (1979) is only true for the fixed gauge RG and not the standard RG. One may use this fact to extract the explicit gauge dependence of the fixed gauge RG invariants. (18 refs.)

74598 Non-Abelian gauge theories and Riemannian geometry on principal bundle with a scalar function or functional. An Ying, Chen Shi, Guo Hanying (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.1, p.34-9 (Jan. 1983). [received: June 1983]

It is shown that the non-Abelian gauge theories and their extension can be studied by means of the Riemannian geometry on principal bundles with an arbitrary scalar function or functional. The authors obtain the covariant conservation equations of gauge charges and the motion equations of test particles in the fields, based on the assumption that test particles move along the geodesics on the bundle space. They discuss the relationship between the Kaluza type actions and the usual Yang-Mills actions and suggest a kind of non-Abelian gauge theory with a scalar field. (7 refs.)

74599 Static and spherically symmetric dyon solutions in SU(N) gauge theory. Ma Zhongqi (Inst. of High Energy Phys., Acad. Sinica, Beijing, China).

Kexue Tonghao (Foreign Lang. Ed.) (China), vol.28, no.3, p.328-32 (March 1983). (13 refs.)

74600 Quantization of Galilean gauge theories. F.Palumbo (Istituto Nazionale di Fisica Nucleare, Frascati, Italy).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.3, p.81-5 (21 May 1983).

Galilean gauge theories are quantized using Dirac's theory of canonical quantization of constrained systems. The infra-red sector for the Abelian case is exactly solved and shown to be analogous to that of the relativistic case. (7 refs.)

74601 Chiral property of the generalized Gross-Neveu model with $U_N \times U_N$ flavour chiral symmetry in 1+1 dimensions. S.Sakai (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.3, p.95-8 (21 May 1983).

The generalized Gross-Neveu model with $U_N \times U_N$ flavour chiral symmetry in 1+1 dimensions is studied by means of boson-fermion metamorphosis. A more rigorous argument on the presence of the low-temperature phase of Berezinski-Kosterlitz-Thouless type is presented. Low-lying physical fermion masses are obtained. (13 refs.)

74602 Generalized field theories and solutions. J.L.Reid (Dept. of Phys. & Astron., Univ. of Georgia, Athens, GA, USA), P.B.Burt.

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.3, p.116-18 (21 May 1983).

By beginning with a special class of solutions of field equations, new field equations are derived. (8 refs.)

74603 Quantisation of spontaneously broken gauge theories in the unitary gauge through the Dirac-bracket formalism. H.O.Girotti, H.J.Rothe (Inst. de Fisica, Univ. Federal do Rio Grande do Sul, Porto Alegre, Brazil).

Nuovo Cimento A (Italy), vol.75A, ser.2, no.1, p.62-8 (1 May 1983).

The authors reconsider the quantisation of the Higgs model in the unitary gauge using the Dirac-bracket quantisation procedure. It is found that the structure of some of the equal-time commutators is quite abnormal. It is then shown in a very clear and systematic way that this anomalous structure is closely connected with the well-known quartically divergent contribution to the effective Higgs Lagrangian. This contribution has been shown to play an important role in the cancellation of nonrenormalisable divergences. (13 refs.)

74604 All the standard irreducible equations of spin $3/2$ without auxiliary spin $3/2$. G.Labonte (Inst. fur Theoretische Phys., Freie Univ. Berlin, Berlin, Germany).

Nuovo Cimento A (Italy), vol.75A, ser.2, no.1, p.69-79 (1 May 1983).

A construction is made of all the possible Γ -matrices for the standard relativistic wave equations of spin $3/2$, belonging to the family of those for which $3/2$ is not an auxiliary spin. The corresponding equations, which are irreducible when minimally coupled to an electromagnetic field, are obtained: some exist for any Harish-Chandra degree greater than or equal to four. (7 refs.)

74605 Remarks on Weyl's gauge field. M.Nishioka (Dept. of Phys., Faculty of Liberal Arts, Yamaguchi Univ., Yamaguchi, Japan).

Nuovo Cimento A (Italy), vol.75A, ser.2, no.1, p.80-6 (1 May 1983).

Using the manifestly gauge-invariant Lagrangian of the system in which a real scalar field (matter field) is interacting with itself and Weyl's gauge field, the author studies the equations of the matter field and Weyl's gauge field, and discusses the self-interacting term of the matter field. (9 refs.)

74606 Light spinor monopole. Li Xinzhou, Wang Kellin, Zhang Jianzu (Internat. Centre for Theoretical Phys., Trieste, Italy).

Nuovo Cimento A (Italy), vol.75A, ser.2, no.1, p.87-92 (1 May 1983).

Suggests that the monopole may have a light mass, which gives the possibility to avoid a conflict between cosmology and grand unification theory. (6 refs.)

74607 Gauge and nongauge curvature tensor copies. P.P.Srivastava (Internat. Centre for Theoretical Phys., Trieste, Italy).

Nuovo Cimento A (Italy), vol.75A, ser.2, no.1, p.93-9 (1 May 1983).

A procedure for constructing curvature tensor copies is discussed by using the anholonomic geometrical framework. The corresponding geometries are compared and the notion of gauge copy elucidated. An explicit calculation is also made. (10 refs.)

- 74608 The stress-energy-momentum tensor of the Gauss map in the extended nonlinear σ -model.** B.Nielsen (Math. Inst., Tech. Univ. of Denmark, Lyngby, Denmark). *Nuovo Cimento B (Italy)*, vol.74B, ser.2, no.2, p.159-66 (11 April 1983).
- By interpreting the nonlinear σ -model as the Gauss map associated to a certain immersion, the author derives an explicit connection between the energy-momentum tensor and the geometry of space-time. The author is then able to point out what follows: (i) the cosmological term is intimately connected with the mean curvature of the immersion, (ii) the possible space-times are restricted by a requirement on the associated immersions, (iii) the energy of the solution is given by the square of the mean curvature of the immersion. (12 refs.)
- 74609 Solutions to generalized double sine-Gordon equations.** K.Saermark (Phys. Lab. I, Tech. Univ. of Denmark, Lyngby, Denmark). *Phys. Lett. A (Netherlands)*, vol.95A, no.8, p.409-11 (23 May 1983).
- A non-linear differential equation, which encompasses the sine-Gordon and double sine-Gordon equations as special cases, is presented and a solution given in terms of Weierstrass' P functions. The equation is time independent, but a Lorentz transformation may in the usual way produce translational solutions. The special case of the double sine-Gordon equation is considered in some detail. (6 refs.)
- 74610 A reply to 'Gauge invariance and experimental processes'.** Y.Aharonov, C.K.Au (Dept. of Phys. & Astron., Univ. of South Carolina, Columbia, SC, USA). *Phys. Lett. A (Netherlands)*, vol.95A, no.8, p.412-14 (23 May 1983).
- For cited paper see *ibid.*, vol.92, p.71 (1982). The authors reply to the charges by K.H. Yang in his paper 'Gauge invariance and experimental processes'. (3 refs.)
- 74611 Composite gauge bosons in sigma models and supergravity.** A.C.Davis (Inst. for Advanced Study, Princeton, NJ, USA), A.J.Macfarlane, J.W.van Holten. *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.151-5 (26 May 1983).
- The authors discuss the non-compact $SU(n)_1/SU(n) \times U(1)$ sigma models and show there is no dynamical generation of the composite gauge boson in these models in two and three dimensions. They discuss some necessary conditions for the $SU(8)$ gauge boson in $N=8$ supergravity to become dynamical. (19 refs.)
- 74612 Dyon-axion dynamics.** W.Fischler (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA), J.Preskill. *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.165-70 (26 May 1983).
- The authors examine the coupling between magnetic monopoles and axions induced by the Witten effect, and discuss the cosmological implications of monopole-axion interactions. (14 refs.)
- 74613 Extended BRS symmetry in supersymmetric Yang-Mills theory.** N.K.Falck, A.C.Hirshfeld, J.Kubo (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.175-7 (26 May 1983).
- The superspace formulation of pure Yang-Mills theory is extended to $N=1$ supersymmetric Yang-Mills. BRS and anti-BRS symmetry are incorporated in a natural way, and a compact expression for the Lagrangian including the gauge-fixing and Faddeev-Popov ghost terms, is easily derived. (14 refs.)
- 74614 Light composite supermultiplets.** T.R.Taylor (Fermi Nat. Accelerator Lab., Batavia, IL, USA). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.185-9 (26 May 1983).
- It is argued that in a wide class of massless strongly interacting supersymmetric gauge theories there exist confining phases with unbroken supersymmetry. The author explains how to identify and interpret the light composite supermultiplet content of these phases. (12 refs.)
- 74615 Instantons on the lattice.** Y.Iwasaki, T.Yoshie (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.197-200 (26 May 1983).
- The existence of instantons on the lattice is examined taking the two-dimensional CP^1 model as an example. Among theories which are identical in the naive continuum limit, some theories where short range fluctuations are suppressed possess stable instantons, while others do not. (11 refs.)
- 74616 Lattice actions and scaling properties.** Y.Iwasaki, T.Yoshie (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.201-6 (26 May 1983).
- Scaling properties of the topological susceptibility and the magnetic susceptibility of the two-dimensional $O(3)$ σ model are studied by Monte Carlo simulations for various cases of lattice actions. It turns out that either the onset of the scaling law crucially depends on the form of lattice action, or that some physical quantities do not scale. (16 refs.)
- 74617 Gauge-invariant local fields in a gauge theory as interpolating fields for 'glueballs'.** M.Azam, P.P.Divakaran (Tata Inst. of Fundamental Res., Bombay, India). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.207-10 (26 May 1983).
- A method of constructing all gauge-invariant local fields in a classical gauge theory, based on their being generated by a finite set of 'basic' invariants, is presented. A complete relativistic spin reduction of all two- and three-gluon basic invariant fields is given and their possible relevance to glueball classification indicated. (9 refs.)
- 74618 Charges from extra dimensions.** S.Weinberg (Dept. of Phys., Univ. of Texas, Austin, TX, USA). *Phys. Lett. B (Netherlands)*, vol.125B, no.4, p.265-9 (2 June 1983).
- A prescription is given for calculating gauge coupling constants in $(4+N)$ -dimensional models in which N dimensions form an arbitrary compact manifold: each coupling is given by the ratio of $2\pi(16\pi G)^{1/2}$ to an appropriate root-mean-square circumference of the manifold. It is speculated that these couplings will be of order $1/\sqrt{n}$, where n is the number of matter fields whose one-loop quantum energy density is responsible for the compactification. (7 refs.)
- 74619 A class of conformally invariant quantum theory theories.** E.Braaten, T.Curtright, G.Ghandour, C.Thorn (Dept. of Phys., Univ. of Florida, Gainesville, FL, USA). *Phys. Lett. B (Netherlands)*, vol.125B, no.4, p.301-4 (2 June 1983).
- A general family of two-dimensional field theories of the Liouville type, involving one or more scalar fields, is shown to be conformally invariant when quantized canonically over a large class of Fock space. (9 refs.)
- 74620 Unperturbed sine-Gordon solitons as Newtonian particles.** U.Enz (Philips Res. Labs., Eindhoven, Netherlands). *Phys. Rev. B (USA)*, vol.27, no.9, p.5815-16 (1 May 1983).
- The dynamics of the sine-Gordon soliton is studied by the consideration of the breather solution of the sine-Gordon equation in the limit of large soliton separation. It is found that in this limit the sine-Gordon soliton behaves as a Newtonian particle, i.e. the acceleration of the soliton is proportional to the force acting on it. The definition of the force acting on the soliton is scrutinized. (6 refs.)
- 74621 Sine-Gordon model for classical kink mechanics.** J.J.P.Leon (Lab. de Phys. Math., Univ. des Sci. et Tech. du Languedoc, Montpellier, France), G.Reinisch, J.C.Fernandez. *Phys. Rev. B (USA)*, vol.27, no.9, p.5817-18 (1 May 1983).
- To the extent that a sine-Gordon soliton may be viewed as a mass point in a given potential $V(x)$, the authors propose the resulting modified sine-Gordon equation which takes this potential into account and leads to a Newtonian dynamics of the kink in $V(x)$. (8 refs.)
- 74622 Relation between the classical Wilson loop and the angular parallel displacement.** V.Bezerra (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro, Brazil). *Rev. Bras. Fis. (Brazil)*, vol.12, p.67-72 (March 1982). [received: April 1983]
- Investigates a simple relation between the classical Wilson loop and the angular parallel displacement along a closed path (circle) for the case of the instanton-like potentials. (9 refs.)
- 74623 Exact solution of covariant two-particle one-time equation with superposition of one-boson exchange quasipotentials.** V.N.Kapshai, N.B.Skachkov (Joint Inst. for Nuclear Res., Dubna, USSR). *Theor. & Math. Fiz. (USSR)*, vol.53, no.1, p.963-70 (Oct. 1982). Translation of: *Theor. & Math. Fiz. (USSR)*, vol.53, no.1, p.32-42 (Oct. 1982).
- The relativistic bound state of two scalar particles is considered in the Logunov-Tavkhelidze quasipotential approach in the case when the quasipotential is a superposition of a one-meson and a one-photon propagator. For the centrally symmetric case, a relativistic quantization condition for the energy levels is obtained and wave functions are constructed in the momentum representation and in the relativistic configuration representation. (11 refs.)
- 74624 A micro-deSitter spacetime with constant torsion: a new vacuum solution of the Poincare gauge field theory.** P.Baekler, F.W.Hehl (Inst. for Theoretical Phys., Univ. of Cologne, Cologne, Germany). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.1-15.
- The authors study the Poincare gauge field theory with Lagrangians of the type (curvature scalar + torsion²)/ l^2 + curvature²/ \mathcal{M} . Here l is the Planck length and \mathcal{M} the coupling constant of the hypothetical Lorentz gauge bosons. They find a new vacuum solution with a deSitter metric and with constant microscopic torsion $\sim \sqrt{\mathcal{M}/l}$ and curvature $\sim \mathcal{M}/l^2$. Its curvature displays double duality properties. (82 refs.)
- 74625 Algebraic construction of static axially symmetric self-dual fields.** R.Sasaki (Res. Inst. for Theoretical Phys., Hiroshima Univ., Hiroshima, Japan). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.31-5.
- The author presents the problem of solving self-dual gauge field equations for an arbitrary compact semisimple gauge group G . The discussion is mostly focused on the simple case of the static and axially symmetric configuration, in which the effective spacetime dimension is reduced to two. A main application is the construction of axially symmetric monopole solutions in gauge theories with an arbitrary group G and a single Higgs field in the adjoint representation. (7 refs.)
- 74626 Massive gauge theories in three dimensions at high temperature.** R.Jackiw (Center for Theoretical Phys., Dept. of Phys., MIT, Cambridge, MA, USA). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.45-57.
- Gauge theories in three dimensions provide interesting case studies of gauge invariant quantum field theoretic phenomena. The special topological properties of odd-dimensional space allow the construction of a gauge invariant mass term in three dimensions. Moreover, for non-Abelian gauge groups, the configuration space of the quantum theory is not simply connected, and as a consequence the mass must be quantized. (7 refs.)
- 74627 Stochastic quantization and large N reduction.** J.Alfaro, B.Sakita (Dept. of Phys., City Coll., City Univ. of New York, New York, NY, USA). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.65-74.
- The stochastic quantization method of Parisi and Wu is used in order to understand the quenched momentum prescription for large N theories. The Hermitian matrix field theory model is studied first and then the same method is applied to $SU(N)$ gauge theory. (5 refs.)
- 74628 Variational methods in the master field formulation for QCD_{3+1} .** M.Sato (Dept. of Phys., New York Univ., New York, NY, USA). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.75-8.
- Master fields are formulated for finite N - QCD_{3+1} . They satisfy classical Yang-Mills equations with an infinite number of internal indices and an infinite number of constraints. Master fields and constraints on them in the large N limit are derived from the finite N master fields and constraints using vacuum dominance among color singlet states. The large N constraints can be explicitly solved and the solutions involve arbitrary functions which are used as trial functions in variational calculations. (5 refs.)
- 74629 Confinement by thick magnetic vortices.** T.Yoneya (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.79-83.
- An argument is presented showing that the pure lattice gauge theories which are infrared unstable at the origin of the coupling constant are always in confining phase, provided that (i) the gauge group is compact and contains nontrivial center; (ii) Lagrangian does not contain long range interaction. The steps for an attempt at a proof of confinement are suggested. (4 refs.)
- 74630 Renormalizability of massive Yang-Mills theory.** T.Fukuda, H.Matsuda, Y.Seki, K.Yokoyama (Res. Inst. for Theoretical Phys., Hiroshima Univ., Hiroshima, Japan). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.84-8.
- The authors aim to reveal the renormalizable structure of massive Yang-Mills (YM) theories on the basis of the formalism in the authors' previous work (1982), though there had so far been found several counter-observations. The formalism consists of four kinds of auxiliary scalar fields other than a massive gauge field A_μ ; a massless scalar fields ϕ^2 , in addition to the usual Lagrange

multiplier field η^a and a pair of Faddeev-Popov ghost fields C^a and \bar{C}^a . (8 refs.)

74631 Renormalization and scaling of non-abelian gauge fields in curved space-time. L.Parker (Dept. of Phys., Univ. of Wisconsin, Milwaukee, WI, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.96-100

Flat space-time non-abelian gauge field theories are renormalizable and asymptotically free. The author shows that non-abelian gauge fields in curved space-time are renormalizable at the one-loop level; and that the property of asymptotic freedom is preserved. (9 refs.)

74632 Two-point functions and renormalized observables. S.A.Fulling (Maths. Dept., Texas A&M Univ., College Station, TX, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.101-6

The author presents a theory of a quantized field propagating in a given curved background space-time. The theory is an unambiguous, internally consistent quantum theory of such a system, in which any physical quantity can in principle be calculated. Whether this kind of model is relevant to the real world is a separate question. The physical interpretation of a quantum field theory in curved space must be sought in the stress-energy-momentum tensor and other local field observables. (45 refs.)

74633 Vacuum energy in the bag model. P.Candelas (Center for Theoretical Phys., Univ. of Texas, Austin, TX, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.107-12

The vacuum energy of the Yang-Mills field is examined for the conditions of the bag model. The imposition of confining boundary conditions for all frequencies is shown to be inconsistent since this would result in the bag constant and certain of the shape tensions being infinite. (7 refs.)

74634 Stochastic quantization and Gribov problem. M.Horibe (Faculty of Education, Fukui Univ., Fukui, Japan), A.Hosoya, J.Sakamoto.

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.113-15

The authors report a modest progress in the Gribov problem in the framework of the stochastic quantization method. They present the Langevin equation for a gauge field without the necessity for gauge fixing. (5 refs.)

74635 The geometry of the configuration space of non abelian gauge theories. C.M.Viallet (Lab. de Phys. Theorique et Hautes Energies, Univ. Pierre et Marie Curie, Paris, France).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.116-19

The author presents results on the geometry of the configuration space of non abelian gauge theories. It is on this space that a Schrodinger equation (or equivalently a path integral) is to be defined. The study of the geometry of the configuration space is a necessary step for a proper non perturbative quantization of the theory. (11 refs.)

74636 Lattice gauge theory—a progress report. J.Shigemitsu (Dept. of Phys., Brown Univ., Providence, RI, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.120-32

Some recent calculations in lattice gauge theory are reviewed. These include estimates of the heavy quark potential, the hadron spectrum, and scales of chiral symmetry breaking. (26 refs.)

74637 Recent developments in the theory of large N gauge fields. T.Eguchi, H.Kawai (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.133-40

Quantum field theories with global or local symmetry greatly simplify in the limit $N \rightarrow \infty$. The authors discuss the effects of quenching reduction and twist in this limit. (11 refs.)

74638 Topological excitations on a lattice. Y.Iwasaki, T.Yoshie (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.141-5

The authors study by numerical methods the existence of instantons and the role played by instantons on a lattice, by taking the CP model in two dimensions as an example. (11 refs.)

74639 Observation of Aharonov-Bohm effect by electron holography. A.Tonomura, T.Matsuda, R.Suzuki, A.Fukuhara, N.Osakabe, H.Umezaki, J.Endo, K.Shinagawa, Y.Sugita, H.Fujiwara (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.146-54

The authors discuss several experiments performed to observe the Aharonov-Bohm effect as evidence of gauge fields. (11 refs.)

74640 BRS transformation and color confinement. K.Nishijima (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.155-60

Interpretation of hadrons in terms of quarks and antiquarks has been so successful that one can no longer think of its substitute. The hadron spectrum and high energy hadron reactions are believed to be described by means of quantum chromodynamics (QCD). In the lattice gauge theory the condition for quark confinement is given by the area law for the Wilson loop. The author looks for the corresponding condition within the framework of the conventional continuum field theory. (5 refs.)

74641 Covariant operator formalism of gauge theories and its extension to finite temperature. I.Ojima (Res. Inst. for Math. Sci., Kyoto Univ., Kyoto, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.161-5

On the basis of 'thermo field dynamics' allowing the application of the Feynman diagram method to real-time Green's functions at $T \neq 0K$, a field-theoretical formulation of finite-temperature gauge theory is presented. It is an extension of the covariant operator formalism of gauge theory based upon

the BRS invariance: The subsidiary condition specifying physical states, the notion of observables, and the structure of the physical subspace at finite temperatures are clarified together with the key formula characterizing the temperature-dependent 'vacuum'. (12 refs.)

74642 Path integration at the crossroad of stochastic and differential calculus. C.DeWitt-Morette (Dept. of Astron. & Center for Relativity, Univ. of Texas, Austin, TX, USA).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.166-70

Ever since Newton differential calculus has been a very successful language for the description of physical systems; stochastic calculus on the other hand has only recently become an instrument of thought but has already been used in challenging problems. The author presents some applications of stochastic calculus and differential calculus. (7 refs.)

74643 Background field method of gauge theory and the renormalization problem. S.Ichinohe, M.Motomoto (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.204-7

The authors present the background field method proposed by DeWitt (1967) to quantize gauge theories without losing invariance. This is very important in discussing the renormalisation problem of non-abelian gauge theories. They discuss a systematic renormalisation procedure by using this method and by generalising the counter-term formula of 't Hooft to two loop processes. (4 refs.)

74644 The auxiliary field/ultraviolet finiteness connection. P.K.Townsend (Lab. de Phys. Theorique, Ecole Normale Supérieure, Paris, France).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.240-8

The status of the auxiliary field program for supersymmetric field theories is reviewed, with emphasis on the implications for improved ultraviolet behaviour, and conversely on the implications of ultraviolet behaviour for auxiliary fields. (24 refs.)

74645 Non-local gauge theories. S.L.Adler (Inst. for Advanced Study, Princeton, NJ, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.29-123

The conventional quantum field theories describing the dynamics of flavor processes [such as the $SU(2) \otimes U(1)$ weak-electromagnetic model, or effective strong interaction field theories such as the σ -model or chiral Lagrangian models] are local field theories, in which all operators commute or anticommute for spacelike-separated arguments. The basic premise is that field theories describing color processes [such as $SU(3)$ quantum chromodynamics (QCD) for quark interactions, or heavy color models for possible quark-lepton constituents] should be constructed as non-local field theories, in which the gluon operators (and in the relativistic case, the fermion operators as well) contain components which do not simply commute or anticommute when the arguments are spacelike-separated. The author gives arguments to support this contention, and applications. (18 refs.)

74646 Bianchi-Backlund transformations, conservation laws, and linearization of various field theories. Ling-Lie Chau (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.249-80

Discusses a possible future solution of non-Abelian gauge theories to help in the understanding of strong interactions. The author speculates whether the mathematical tools used to study two dimensional Yang-Mills theories can be used for four-dimensional non-Abelian gauge theories. (47 refs.)

11.30 SYMMETRY AND CONSERVATION LAWS

(see also 02.20 Group theory)

- 74647 Shift operator approach of the spin-isospin supermultiplet state labelling problem: eigenvalue determination of the Ω and Φ labelling operators. J. Van der Jeugt, H.E. De Meyer, G. Vanden Bergh (Seminarie voor Wiskundige Natuurkunde, Rijksuniversiteit Gent, Gent, Belgium). *Ann. Phys. (USA)*, vol.147, no.1, p.85-139 (15 April 1983).
 The two missing labels problem which occurs in the reduction of SU(4) irreducible representation (irreps) into SU(2) \otimes SU(2), irreps has been solved by Moshinsky and Nagel (1963) who proposed a pair of commuting Hermitian labelling operators Ω and Φ . However, explicit and closed formulae expressing the eigenvalues and eigenvectors of Ω and Φ have not been found so far, except for a few particular and almost trivial cases. The authors find four sets of SU(2) \otimes SU(2) shift operators. Quite a number of relations connecting quadratic products of shift operators are constructed. On account of these, general formulae expressing the Ω - and Φ -eigenvalues for non-degenerate and twofold degenerate states are obtained. (38 refs.)
 74648 Lepton-violating $\beta^-\beta^+$, $\beta^+\beta^+$ decays, (e^-, e^+) conversion and double electron capture in gauge theories. J.D. Vergados (CERN, Geneva, Switzerland). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.109-44 (30 May 1983).
 The lepton violating processes $\beta^-\beta^+$, $\beta^+\beta^+$, (e^-, e^+) and double electron capture have been investigated in the context of modern gauge theories. Mechanisms involving light or heavy intermediate Majorana neutrinos, with or without right-handed currents, as well as Higgs particles, have been studied. The lepton-violating emission of light bosons, recently proposed by Georgi, Glashow and Nussinov (1981), has also been analyzed. From the analysis of the $^{48}\text{Ca} \rightarrow ^{48}\text{Ti}$ data the following limits emerge: $| \langle m_{\nu} \rangle | < 80 \text{ eV}$, $m_N > (2.20) \times 10^3 \text{ GeV}$, $m(W_R) > 400 \text{ GeV}$ and $g(\nu_{\tau}, 0) < 5 \times 10^{-3}$. The above limits are then used to predict the lifetimes for $\beta^+\beta^+$, (e^-, e^+) and double electron capture in the $A=58, 92$ and 96 systems employing realistic nuclear models. (38 refs.)
 74649 Vacuum alignment and dynamical symmetry breaking in two-dimensional models. A. d'Adda (Maths. Dept., Durham Univ., Durham, England), A.C. Davis, P. Vecchia. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.191-204 (30 May 1983).
 The authors discuss a class of two-dimensional models in which a non-Abelian gauge symmetry is dynamically broken by a fermion bilinear condensate. Using the $1/N$ expansion they examine the vacuum alignment of their models. For a chirally invariant model there is a vacuum degeneracy, when the chiral symmetry is explicitly broken the vacuum aligns. (8 refs.)
 74650 Fractional charges: global and local aspects. W.A. Bardeen (Fermilab, Batavia, IL, USA), S. Elitzur, Y. Frishman, E. Rabinovici. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.445-58 (6 June 1983).
 The properties of topological objects with fractional charge are studied. The authors first transform to new variables, in terms of which the lowest order contribution gives the fractional charge. They then gauge that fractional charge. Effects of the θ angle in two dimensions are studied. In particular arbitrary periods may be obtained. Induced extra charge due to θ turns out to

be proportional to $\sqrt{\theta}$. C and P violations due to θ may be arbitrarily small in some cases. (8 refs.)

- 74651 A note on supersymmetry breaking in $1+1$ dimensions. T. Murphy, L.O. Raifeartaigh (Dublin Inst. for Advanced Studies, Dublin, Ireland). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.484-92 (6 June 1983).
 The spontaneous breakdown of supersymmetry for a single chiral superfield in $1+1$ dimensions is investigated and a number of puzzling features are resolved by noting that the loop expansion is not always valid. It is found that both broken and unbroken supersymmetry are stable with respect to radiative corrections. (9 refs.)
 74652 A procedure for generating realizations of Li-admissible and other nonassociative algebras. A.J. Kalnay (Centro de Fisica, Inst. Venezolano de Investigaciones Cientificas, Caracas, Venezuela). *Hadronic J. (USA)*, vol.6, no.2, p.278-304 (March 1983).
 The author starts with an arbitrary nonassociative algebra β over a field F and arbitrarily selects two fixed elements $P, Q \in \beta^*$ and four fixed $\alpha_i \in F$. Then, generalizing Albert's quasiasociative algebras and Santilli's fundamental realization of the Lie-admissible algebras he constructs, in terms of β^* , P , Q and the α_i a new algebra β^{**} over the same field. After showing some formulae for the case of a general β^{**} , he restricts himself to the case in which P and Q belong to the center of β^* . He proves that, in such a case, if β^* is Lie-admissible, then β^{**} is also Lie-admissible. Moreover, if β^{**} is Lie-admissible and $P+$ has an inverse within β^* , then β^* is also Lie-admissible. The procedure $\beta^* \rightarrow \beta^{**}$ can, within certain limits, be iterated. Therefore he opens the possibility of an eventual significant enrichment of the set of available specific examples of Lie-admissible algebras. Theorems which resemble the above one are also obtained if, instead of Lie-admissible algebras, the following algebras are considered: commutative, power associative, flexible, Lie, commutative Jordan, Jordan-admissible, nil and Grassmann. Finally, a sufficient condition for the existence of a unit element within β^{**} is shown. (36 refs.)
 74653 Axions and supersymmetry. J.-M. Frere (Univ. Libre, Bruxelles, Belgium), J.-M. Gerard. *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.4, p.135-41 (28 May 1983).
 Most of the proposed supersymmetric low-energy models contain at least one accidental axial symmetry which at first sight could solve the strong CP problem. Unfortunately experimental, astrophysical and cosmological constraints on the one side and asymptotic freedom on the other are never simultaneously respected. The authors consider the supersymmetric realization of the Kim, Shifman, Vainshtein and Zakharov mechanism as a new guide for model building. (17 refs.)
 74654 Superconformal current multiplet. A. Smilagic (Internat. Centre for Theoretical Phys., Trieste, Italy). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.4, p.156-60 (28 May 1983).
 The author considers a derivation of a superconformal current multiplet based directly on superconformal algebra. This gives the usual multiplet of currents without anomalies, directly in terms of 'improved' quantities and without reference to a particular Lagrangian model. (8 refs.)
 74655 Krull dimension of factor rings of the enveloping algebra of a semi-simple Lie algebra. S.P. Smith (Univ. of Southern California, Los Angeles, CA, USA). *Math. Proc. Cambridge Philos. Soc. (GB)*, vol.93, pt.3, p.459-66 (May 1983).
 Let \mathfrak{g} be a semi-simple complex Lie algebra with enveloping algebra $U(\mathfrak{g})$. It is shown that the Krull dimension of $U(\mathfrak{g})$ is bounded above by $\dim \mathfrak{g}^*$, where r is half the minimal dimension of a non-trivial G orbit in \mathfrak{g}^* (G is the adjoint group of \mathfrak{g}). (20 refs.)
 74656 Soft breaking of $N=4$ supersymmetry. J.J. van der Bij, York-Peng Yao (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.171-4 (26 May 1983).
 The authors consider the addition of soft breaking terms to the $N=4$ supersymmetric Yang-Mills Lagrangian. $N=1$ supersymmetric mass terms and mass terms of the form $(A^2 - B^2)$ do not give rise to any new divergence, which implies that in a gauge in which the massless theory is completely finite, this finiteness is preserved. All other soft terms give rise to at most logarithmic divergences. (7 refs.)
 74657 Mass spectrum of the W^\pm and Z supermultiplets. P. Fayet (Lab. de Phys. Theorique, Ecole Normale Supérieure, Paris, France). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.178-84 (26 May 1983).
 In supersymmetric theories the W^\pm and Z may be associated with spin-1/2 and spin-0 partners, the latter being Higgs bosons. The author studies their mass matrix and shows that, in a class of theories with gravity-induced supersymmetry breaking, the spin-1/2 partners of the W^\pm and Z have masses $|m_{3/2} \pm m_W|$, $|m_{3/2} \pm m_Z|$, while spin-0 leptons and quarks have masses $|m_{3/2} \pm m_{l,q}|$, $|m_{3/2}|$ being the common mass of the gravitino, photino and gluinos. These new particles may all be heavier than the W^\pm . On the other hand, if the gravitino is lighter than $120 \text{ GeV}/c^2$ one expects to see, below a mass of $40 \text{ GeV}/c^2$, either spin-0 partners of leptons and quarks, or spin-1/2 partners of the W^\pm and Z . (16 refs.)
 74658 On the dynamic origin of the kinetic terms. A.V. Chizhov, M.V. Chizhov (Joint Inst. for Nuclear Res., Dubna, USSR). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.190-2 (26 May 1983).
 In the one-loop approximation it is shown that the local self-interaction of the chiral spinor field gives rise to kinetic terms for collective fields in a self-consistent manner. (9 refs.)
 74659 On a self-consistent chiral doublet composite scheme. Y.F. Pirogov (Inst. for High Energy Phys., Serpukhov, USSR). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.193-6 (26 May 1983).
 A composite scheme with a chiral doublet of charges $Q=(2/3, -1/3)$ is considered. The scheme is self-consistent in the sense that the constituent spectator chiral symmetry SU(2) \times U(1) coincides with the chiral electroweak symmetry. Due to the mirror fermions they both are anomaly free. The chiral colour symmetry arises as an effective symmetry of composite quarks. The scheme contains exotic composite fermions with isospin $I=3/2$. The common maximal effective symmetry of both ordinary and exotic composite fermions is the chiral SU(2) \times SU(4) one, the latter being a possible partial unified symmetry. (14 refs.)
 74660 The massless gluino and the pseudoscalar meson family. A.V. Smilga, M.I. Vysotsky (Inst. of Theoretical & Experimental Phys., Moscow, USSR). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.227-9 (26 May 1983).
 It is shown that the masslessness of the gluino leads necessarily to the existence of a light isosinglet pseudoscalar boson which is not observed in experiment. Thus, any realistic supersymmetry model must include the mechanism for generating the gluino mass. (7 refs.)

74661 Algebra of nonlocal charges in two-dimensional chiral models. D.V.Volkov, V.D.Gershun, V.I.Tkach. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.641-9 (May 1983). In Russian. Algebra of nonlocal charges is investigated in two-dimensional chiral models. It is shown that an infinite set of nonlocal charges can be derived by successively using the Poisson brackets for the first nonlocal charge. A general scheme is obtained for deriving the nonlocal charge algebra of the Poisson brackets. The algebra of the Poisson brackets is exactly computed for the first four nonlocal charges. It is shown that the Poisson brackets algebra of nonlocal charges generates an infinite-dimensional algebra different from the Kac-Moody algebra. (19 refs.)

11.50 DISPERSION RELATIONS AND SUM RULES

74663 On the generality of the mass sum rule. J.Polchinski, M.B.Wise (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.297-308 (6 June 1983). The sum rule, $\sum_i (-1)^{2J_i} (2J_i + 1) m_i^2 = 2\sum_a D^a \text{Tr} Q^a$, is studied to first order in supersymmetry breaking, treating the other interactions exactly. It is found to hold for spontaneous breaking and many types of explicit breaking. (15 refs.)

11.80 RELATIVISTIC SCATTERING THEORY
(see also 03.80 General theory of scattering)

74664 Relativistic quantum states of a particle in an electromagnetic plane wave and a homogeneous magnetic field. J.Bergou (Central Res. Inst. for Phys., Budapest, Hungary), F.Ehlotzky. *Phys. Rev. A (USA)*, vol.27, no.5, p.2291-6 (May 1983). The exact solutions of the Klein-Gordon and Dirac equations are found by purely algebraic procedures for a charged particle embedded simultaneously in a plane-wave radiation field and in a uniform magnetic field which is directed parallel to the direction of propagation of the plane wave. Two cases of the solutions are considered: (i) the radiation field is a classical external plane wave and (ii) it is a quantized field. The connection with less explicit or more specific solutions of this problem known previously is established and possible applications are discussed. (12 refs.)

74665 New bounds for the total cross section and the zero free radius of the scattering amplitude. J.K.Mohapatra (Dept. of Phys., Regional Coll. of Education, Bhubaneswar, India), J.Maharana. Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.70. Summary form only given. Upper bounds on $\sigma_T(s)$ is deduced which seems to be an improvement over the existing ones if one supplements it with the behaviour of the slope parameter data. Bound, on the zero free radius of the scattering amplitude, is also obtained.

Annual review of nuclear and particle science. Vol.32 See Entry 74232

12.10 UNIFIED FIELD THEORIES AND MODELS

74666 Theoretical predictions for baryon number violation. P.Langacker (Univ. of Pennsylvania, Philadelphia, PA, USA). *AIP Conf. Proc. (USA)*, no.96, p.110-23 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982). The author describes the theoretical predictions for proton decay and other baryon number violating processes, emphasizing that there are many models and theories involving baryon number violation and that it is an experimental problem to distinguish between them. The author reviews the theoretical predictions for the unification mass M_X and for the weak angle $\sin^2 \theta_W$. It will be seen that the class of models involving an $SU_3 \times SU_2 \times U_1$ invariant descent between M_W and M_X are strongly favoured. The proton lifetime and branching ratio predictions for the SU_3 and other 3-2-1 desert models are reviewed, with emphasis on distinguishing between models and on the implications of the small value of the QCD parameter $\Lambda(\bar{u}s)$ that seems to be favoured by the data. The author discusses the consequences of low energy supersymmetry

for proton decay, nuclear effects, and models with low mass scales. Other topics, including the possibility of observing baryon number violation at accelerators, baryon number violation induced by magnetic monopoles, the violation of Lorentz invariance in proton decay, and antiproton cosmic rays are discussed. (26 refs.)

74667 Grand unification—a review. V.P.Nair, K.C.Wali (Phys. Dept., Syracuse Univ., Syracuse, NY, USA). *AIP Conf. Proc. (USA)*, no.98, p.1-18 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

The authors emphasize the general ideas behind grand unification with special attention on the violation of well-known low energy conservation laws such as baryon and lepton number. They discuss the relevance of the grand unification ideas to astrophysics and some of the theoretical problems in model building, and the salient features of a few generic models. They conclude the review with some general remarks. (6 refs.)

74668 The proton decay—magnetic monopole connection. C.G.Callan, Jr. (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA). *AIP Conf. Proc. (USA)*, no.98, p.24-34 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

It has been claimed that grand unification magnetic monopoles catalyze baryon decay at strong interaction rates. A qualitative discussion is given of the physical mechanisms underlying this process as well as a brief discussion of some of its phenomenological implications. (6 refs.)

74669 Testing the standard model. H.Gordon, W.Marciano (Brookhaven Nat. Lab., Upton, NY, USA), H.H.Williams, K.Abe, M.Chanowitz, R.Cool, M.Derrick, J.Friedman, B.Gittelman, M.Goldberg, K.Gottfried, P.Granis, I.Hinchcliffe, J.Jackson, H.Kagan, P.Lepage, A.Melissinos, T.O'Halloran, S.Olson, F.Paige, F.Pipkin, R.Ruchti, M.Samuel, K.Shinsky, R.Shrock, H.Siemann, H.Sticker, M.Tannenbaum, F.Taylor, M.Tuts, H.Tye, G.Tzanakos, H.Vogel, D.White, R.Wilson, J.Wiss. *AIP Conf. Proc. (USA)*, no.98, p.39-79 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

The authors summarize the results of the standard model group which has studied the ways in which different facilities may be used to test in detail what we now call the standard model, that is $SU_c(3) \times SU(2) \times U(1)$. Shown below are the topics considered with the names of the individuals working on each topic. (36 refs.)

74670 Global and local supersymmetric grand unification. P.Nath (Dept. of Phys., Northeastern Univ., Boston, MA, USA), R.Arnowitz, A.H.Chamseddine. *AIP Conf. Proc. (USA)*, no.98, p.247-61 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

A brief review of the globally supersymmetric grand unified theories is given. The new proposal of locally supersymmetric grand unification (supergravity GUTS) is discussed. Here the topics include construction of the Lagrangian which couples the $N=1$ supergravity multiplet with an arbitrary number of chiral multiplets and a gauge vector multiplet, super-Higgs phenomena and spontaneous breaking of supersymmetry and $SU(2) \times U(1)$ at a common weak interaction mass scale and phenomenological implications of supergravity GUTS. Questions relating to the ground state of the theory are also discussed. (34 refs.)

74671 Massless neutrinos in left-hand symmetric models. D.Wyler (CERN, Geneva, Switzerland), L.Wolfenstein. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.205-14 (30 May 1983).

Presents an alternative to the Yanagida-Gell-Mann-Ramond-Slansky method (1979) of obtaining small neutrino masses in spite of normal Dirac mass terms in left-right symmetric theories. In this scheme, the light neutrinos remain massless while there exist massive Dirac neutral leptons in each generation. The masses of these are determined by the scale of left-right symmetry breaking, which must be large enough to prevent flavour-changing processes such as $\mu \rightarrow e \gamma$. (25 refs.)

74672 Anomalous baryon number non-conservation in the presence of $SU(5)$ monopoles. V.A.Rubakov, M.S.Serebryakov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.240-68 (30 May 1983).

It is shown that the effects related to the Adler-Bell-Jackiw anomaly give rise to strong baryon number non-conservation in the presence of magnetic monopoles in the $SU(5)$ grand unified theory. The main assumption made is that, as long as distances of order 1 GeV^{-1} from the monopole center are considered, the masses of light fermions u, d, s, e, μ can be neglected, while heavy fermions decouple. Two types of the $SU(5)$ monopoles are studied, namely: (i) the fundamental monopole with a non-vanishing chromomagnetic charge (ii) the minimal purely electromagnetic monopole. In both cases the processes like $p + \text{monopole} \rightarrow e^+ + \text{monopole} + \text{everything}$ are allowed. It is argued that the cross sections of these processes are of order $1 \text{ GeV}^{-2} \beta^{-2}$, at least for sufficiently low monopole-proton relative velocities β . (37 refs.)

74673 Early unification and the Weinberg angle in the $SU(4)^4$ grand unified model. A.Yu.Ignatiev, N.G.Kozimirov, V.A.Kuzmin (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.423-44 (6 June 1983).

In the framework of the grand unified gauge group $SU(4)^4$ the authors discuss possibilities to reconcile the low unification scale ($10^2\text{--}10^7 \text{ GeV}$) with the acceptable value of $\sin^2 \theta_W$. They consider various specific models which differ by the values of the intermediate mass scale, the choice of the fermion multiplets and by the embedding of the electroweak group $SU(2)$ into $SU(4)^4$. The class of theories with early unification and correct $\sin^2 \theta_W$ is constructed. They all predict new non-sequential fermions which are $SU(2)_{L,R}$ singlets and have unconventional electric charges. Cosmological implications of such theories are discussed and it is argued that new particles may well account for the positive results of searches for fractional charge in terrestrial matter. (19 refs.)

74674 Grand unification with local supersymmetry. L.E.Ibanez (Dept. de Fisica Teorica, Univ. Autonoma de Madrid, Madrid, Spain). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.514-44 (6 June 1983).

The author studies general conditions for obtaining spontaneous breaking of local supersymmetry in $N=1$ supergravity coupled to supersymmetric matter. The author considers in particular the coupling of $N=1$ supergravity to grand unified theories like $SU(5)$ and study the conditions which must be met in order to obtain a realistic model. Specific models are built in which local supersymmetry is broken at a scale $\sqrt{M_{\text{WMP}}} \sim 10^{10} \text{ GeV}$. This breaking of

supersymmetry is only detected at low energies through soft terms breaking explicitly the global supersymmetry. These soft terms (scalar masses, gaugino masses and trilinear scalar couplings) are renormalized at low energies according to the renormalization group. The $(\text{mass})^2$ of the Higgs doublet evolve towards negative values at low energies giving rise to $SU(2) \times U(1)$ breaking as a radiative effect of local supersymmetry breaking. The author finally points out the possible relevance of non-renormalizable superpotentials for the problem of fermion masses. (42 refs.)

74675 An approach to gauge hierarchy in the minimal $SU(5)$ model of grand unification. P.Ghose (Internat. Centre for Theoretical Phys., Trieste, Italy).

J. Phys. G (GB), vol.9, no.6, p.L107-10 (June 1983).

It is shown that if all mass generation through spontaneous symmetry breaking is predominantly caused by scalar loops in the minimal $SU(5)$ model of grand unification, it is possible to have an arbitrarily large gauge hierarchy $m_h \gg m_W$ with all Higgs bosons superheavy. No fine tuning is necessary in every order. (11 refs.)

74676 Scalar loops and the Higgs mass in the Salam-Weinberg-Glashow model. P.Ghose (Internat. Centre for Theoretical Phys., Trieste, Italy).

J. Phys. G (GB), vol.9, no.6, p.L111-14 (June 1983).

It is shown that spontaneous symmetry breaking is predominantly driven by scalar loops in the standard Salam-Weinberg-Glashow model if $\lambda \approx O(e^2)$. The Higgs mass is predicted to be $O(64 \text{ GeV})$, which is considerably higher than the Coleman-Weinberg prediction, (1973). (3 refs.)

74677 Space-time approach to the grand unified theory of the quarks and the leptons. O.Hara (Atomic Energy Res. Inst., Nihon Univ., Tokyo, Japan). *Nuovo Cimento A (Italy)*, vol.75A, ser.2, no.1, p.17-38 (1 May 1983).

A space-time approach to the grand unified theory of the quarks and leptons is given by starting from Weyl's tetrad formalism of the theory of general relativity. In this approach the lepton appears as a part of the space-time structure to prepare a local Lorentz frame which is indispensable for the description of the quark described by a Dirac spinor in conformity with the principle of general relativity, and the parallelism between the quark and the lepton is built in from the outset. The lepton thus introduced has a characteristic interaction with the gravitational field. So through this interaction this scheme can be tested experimentally, at least in principle. The discussion is restricted to the case in which only one kind of quark and lepton is included. In this respect it is still not realistic. (20 refs.)

74678 After the W particle, the Higgs. A.Watson.

New Sci. (GB), vol.98, no.1359, p.534-7 (26 May 1983).

Particle physicists feel certain they are on the right track in their attempts to develop a single unifying theory of nature's forces. Recent events have strengthened this opinion, but the theory contains a number of complex twists and there is plenty still for experimenters to discover—including a particle known as the Higgs. (no refs.)

74679 A supersymmetric preon model of particle physics. Y.J.Ng (Stanford Linear Accelerator Center, CA, USA), B.A.Ovrut. *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.147-50 (26 May 1983).

The authors present a supersymmetric preon model based on $SU(M)_{SC} \times SU(2)_L \times SU(3)_C \times U(1)$. Supersymmetry protects chiral symmetries from spontaneous breakdown and allows a solution to the strong CP problem. (11 refs.)

74680 On the S-wave interaction between massive fermions and a GUT magnetic monopole. M.A.Virasoro (Istituto di Fisica G. Marconi, Univ. di Roma, Rome, Italy).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.161-4 (26 May 1983).

The author follows closely the line of analysis of Rubakov (1981, 1982) and Callan (1982) on the S-wave strong interaction between magnetic monopoles and fermions. The observation is that the inclusion of a bare mass term for the fermions modifies in a non-perturbative fashion the two dimensional action of the condensate field. It induces a repulsive barrier. The coefficient of transmission is not computed here. (7 refs.)

74681 Effective Lagrangian for $\Delta S=1$ and $\Delta S=2$ transition in the Higgs boson exchange model of CP violation. Y.Dupont (Centre de Phys. Theorique, Ecole Polytech., Palaiseau, France).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.211-16 (26 May 1983).

Using standard renormalization group techniques, strong interaction corrections to $\Delta S=1$ and $\Delta S=2$ transitions are calculated in the Higgs-boson exchange model of CP violation. It is shown that the box diagram contribution to the ratio ϵ'/ϵ is not modified in any significant way with respect to lowest order calculation. (20 refs.)

74682 Effective low energy custodial symmetry and Weinberg mixing.

P.D.Mannheim (Dept. of Phys., Univ. of Connecticut, Storrs, CT, USA).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.282-6 (2 June 1983).

The author presents a model of the weak interactions in which a custodial symmetry not present in the starting lagrangian emerges in the effective low energy sector of the theory. This symmetry maintains the relation $M_W = M_Z \cos \theta_W$ to any required degree of accuracy while leaving the quark mass spectrum completely unconstrained. (6 refs.)

74683 How supersymmetry makes neutron-antineutron oscillations more natural in $SO(10)$. D.Lust (Theoretische Phys., Univ. Muenchen, Munich, Germany).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.295-300 (2 June 1983).

The author investigates the possibility of observable neutron-antineutron oscillations ($n\bar{n}$) in a supersymmetric $SO(10)$ -model. Since supersymmetry (SUSY) allows six-quark-operators with lower dimension than in the non-supersymmetric case and changes the renormalization group equations through the influence of the supersymmetric partners of the ordinary particles, the $n\bar{n}$ is indeed observable in this scheme. (17 refs.)

74684 Is there a desert beyond the mountains?. C.H.Llewellyn Smith (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).

Physics in Collision. High-Energy $e e / p p$ Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.405-20

The author considers a few of the ways in which the desert may blossom. First he discusses the possibility that the W and Z are composite objects. Then he considers gauge theories, discussing expectations for the W and Z masses before describing the difficulties with the Higgs boson which have led theorists to espouse technicolour and supersymmetry. (53 refs.)

74685 Supersymmetric grand unification. N.Sakai (Nat. Lab. for High Energy Phys., Ibaraki, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.208-16

After a brief discussion of motivations and prototype models, the author reviews recent studies of model building and of proton decay in supersymmetric grand unification. A new effect is mentioned for $\Delta B \neq 0$ four-scalar-inter-

reactions induced by an intermediate scale ($10^{10}\sim 10^{12}$ GeV) supersymmetry breaking. (28 refs.)

74686 Aspects of grand unified models with softly broken supersymmetry. K.Inoue (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), A.Kakuto, H.Komatsu, S.Takeshita.

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.217-21

Supersymmetric theories have an outstanding property of no-renormalization for F-terms. This may give an important key to the solution of the gauge hierarchy problem in the grand unified theories (GUTs). If nature chooses a supersymmetric theory, the supersymmetry must be broken at low energies spontaneously or explicitly. In spontaneously broken supersymmetric theories, however, there is a severe constraint on masses of component fields in a given supermultiplet. The authors discuss explicit supersymmetry breaking in the $SU(3)\times SU(2)\times U(1)$ model with a minimal set of supermultiplets. (8 refs.)

74687 Supersymmetric dipole mechanism and vacuum energy. N.Ohta (Dept. of Phys., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.222-6

The author discusses supersymmetric theories and the resolution of the gauge hierarchy problem in GUTs. The author also considers the non-renormalisation theorem and symmetry breaking in realistic supersymmetric models. (6 refs.)

74688 Nonomy of an inverted hierarchy model. T.Banks (Dept. of Phys. & Astron., Tel Aviv Univ., Ramat Aviv, Israel).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.227-30

This is a report of an unsuccessful attempt to build a realistic grand unified model based on Witten's inverted hierarchy mechanism. Witten's phenomenon is a common property of supersymmetric gauge theories in which supersymmetry (SUSY) is spontaneously broken by the vacuum expectation value of an F term. (6 refs.)

74689 Cosmological phase transition in microcanonical gravity. G.Horowitz (Rishon LeTzion Inst. of Phys., Hebrew Univ., Jerusalem, Israel).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.254-8

Phase transitions in cosmology, whether first or second order, spontaneous or dynamic, were first studied by methods which ignore or exclude gravitational effects (Linde, 1974). The basis for the exclusion was the assumption that the effects are local, and that since the relevant times are much larger than Planck times quantum gravity is unimportant and thus gravity enters only as a background metric which can be removed by studying results in a local inertial frame. The author presents realistic models in which there exists a non-quantum gravitation contribution to the entropy based on a microcanonical treatment of the statistical mechanics. (8 refs.)

74690 Kaluza-Klein type theory. H.Sugarwara (KEK, Tsukuba, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.262-6

The author discusses two problems related to the recently proposed Kaluza-Klein type theory by T. Kaneko and the author (1983). One is Mach's principle and the other is a classical solution to Einstein's equation which has a $[6(X)]^2$ singularity. (3 refs.)

74691 Scale invariant scalar-tensor theory and the origin of gravitational constant and particle masses. Y.Fujii (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.272-6

Scalar-tensor theory seems to offer a natural alternative to the standard theory of gravitation, especially in the unification of gravitation and elementary particles. The author presents a simple viable scalar-tensor theory the result of which is not a variable-G theory in the usual sense. (6 refs.)

74692 How far we are in unifying the fundamental interactions. F.Bucella (Istituto di Fisica, Univ. di Roma, INFN, Roma, Italy).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.125-32

The author discusses unification and the enlargement of the underlying gauge group from $SU(3)_{\text{QCD}}\otimes U(1)_{\text{QED}}$ to $SU(4)$ and then to $SU(5)$. The effects on quark families are also discussed. (19 refs.)

74693 Electroweak physics of the 80s. J.J.Sakurai (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.177-247

Discusses electroweak gauge theories and quantum flavour dynamics for the 1980s. There were great successes in this field in the 1970s and the author speculates whether theorists can repeat this success. (93 refs.)

74694 $SU(5)$ without $SU(5)$: why B-L is conserved and baryon number not in unified models of quarks and leptons. H.J.Lipkin (Fermi Nat. Accelerator Lab., Batavia, IL, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.281-305

Discusses quark-lepton unification without assuming higher symmetries than $SU(3)$ and looks for properties generally attributed to $SU(5)$ models which are already present without the assumption of $SU(5)$. B-L conservation and baryon number violation is described. The author also discusses the search for model independent constraints on the S-matrix which are already present in view of known symmetries. (7 refs.)

74695 QCD, unification and the road to 'asymptopia'. S.J.Lindenbaum (Brookhaven Nat. Lab., Upton, NY, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.575-98

Discusses 'asymptopia', where asymptotic theorems come true, and the energy required for unification including the 'Great Desert' between 10^2 and 10^{12} GeV. QCD, hypercolour, technicolour and preons are also described. (35 refs.)

74696 Properties of the vacuum. II. Electrodynamics. J.Ambjorn, S.Wolfram (California Inst. of Technol., Pasadena, CA, USA).

Ann. Phys. (USA), vol.147, no.1, p.33-56 (15 April 1983).

For pt.1 see *ibid.*, vol.147, p.1-32 (1983). The behaviour of a charged scalar field in an external electric field is discussed. Vacuum polarization is calculated by explicit summation of modes. Instabilities encountered in the external field approximation are absent when back reaction effects are included through a self-consistent semiclassical procedure. (11 refs.)

74697 Does the electromagnetic mass of an electron depend on where it is? P.W.Milonni (Dept. of Phys., Univ. of Arkansas, Fayetteville, AR, USA).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.323-8 (April 1983).

The question of whether the electromagnetic mass of the electron depends upon its electromagnetic environment is discussed in connection with previous theoretical and experimental work. When the quantization of the field in other than free space is properly understood, it is evident that the true electromagnetic mass of the electron is unaltered. (8 refs.)

74698 Wilson loop Langevin equations for $U(1)$ lattice gauge theory. G.Aldazabal, E.Dagotto, A.Gonzalez-Arroyo, N.Parga (Centro Atomico Bariloche, CNEA, Bariloche, Argentina).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.305-7 (2 June 1983).

The authors study the stochastic quantization for lattice QED and derive the corresponding Langevin equations for the Wilson loops. The equivalence with the usual quantization procedure is established in the framework of strong coupling perturbation theory showing that the Wilson loop stochastic equations become the Schwinger-Dyson equations for the loops when the system reaches its equilibrium distribution. (4 refs.)

74699 Electromagnetic vacuum and strong interactions. Yu.A.Baurov, Yu.N.Banaev, V.K.Ablekov.

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.607-9 (Aug. 1982). Translation of:

Dokl. Akad. Nauk SSSR, vol.265, no.4-6, p.1108-12 (Aug. 1982). [received: May 1983]

On the assumption that the elementary charge e is related through the properties of the vacuum state to the velocity c of propagation of the electromagnetic field by the dependence $e=e(c)$, then besides the observed value $c=c_0$, the velocity c can also take the value $c=-c_0$. The authors determine dependence of the strong-interaction constant on the nature of the interacting fields and develop the concepts of the structure of the electromagnetic vacuum. For this purpose, in 'empty space', the authors find the dependence $c=c(r,t)$ for $r>0$ and $r<0$ from the equation obtained for infinitely closely spaced events (i.e., when $d[c(r,t),t]=0$). (8 refs.)

74700 Confinement of light in a polarizable vacuum. A.Khare, T.Pradhan (Inst. of Phys., Bhubaneswar, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.76

Summary form only given. The authors show that an electrically polarizable vacuum with space-dependent permeability $\epsilon(r)=\mu^{-1}(r)=\exp(-\alpha r^2)$ can confine light whose quanta acquire a mass through interaction with this vacuum.

12.30 MODELS OF WEAK INTERACTIONS

74701 Physics of intermediate vector bosons. J.Ellis (CERN, Geneva, Switzerland), M.K.Gaillard, G.Girardi, P.Sorba.

In book: *Annual review of nuclear and particle science. Vol.32*, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.443-97. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

The authors describe the physics of weakly coupled vector bosons, their 'static' properties: mass, decay widths, and branching ratios and their production mechanisms: e^+e^- annihilation, lepton-induced reactions on nucleons, pp and pp collisions. The phenomenology of scalar particles associated with the clouded issue of symmetry breaking is reviewed and a conclusion that the best laboratory for their study may in fact be in associated production with vectors or in their decay is arrived at. (88 refs.)

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

74702 A unified approach to QCD phenomenology. S.J.Brodsky (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).

AIP Conf. Proc. (USA), no.98, p.146-75 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

The Fock state wave functions of hadrons defined by quantizing quantum chromodynamics at equal time on the light-cone provides a unifying element in QCD predictions, from low to high momentum transfer. A number of novel QCD effects are reviewed, including heavy quark and higher twist phenomena, initial and final state interactions, direct processes, multiparticle collisions, color transparency, and nuclear target effects. A method for fixing the momentum scale in leading order QCD predictions is also briefly presented. (69 refs.)

74703 Matter from quark and gluon bits. J.Kuti (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

AIP Conf. Proc. (USA), no.98, p.199-217 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

A powerful stochastic method is presented for the numerical evaluation of path integrals in quantum mechanics and quantum field theory. The method is directly applicable for the detailed numerical study of Quantum Chromodynamics (QCD) with lattice regularization. Important results on non-perturbative physical quantities, like the confining force between a heavy quark-antiquark pair, the critical temperature of thermal quark liberation and the mass gap are reviewed first within the pure gauge sector of the theory. The stochastic treatment of the complete fermionic problem is also described. (27 refs.)

74704 Deep inelastic scattering at small x : two- and three-loop calculations. N.Mitra (Dept. of Phys., Columbia Univ., New York, NY, USA).

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.1, p.145-58 (30 May 1983).

The complete order g^4 and partial order g^6 calculation of deep inelastic scattering at small x is presented. The results agree with the conclusions of a theorem proved in an earlier paper that the total contribution to deep inelastic scattering at small x arises from a ladder diagram evaluated in a restricted region of phase. The subdominance of coupled constant renormalizations at small x is shown with the help of two- and three-loop examples. (10 refs.)

74705 Supersymmetric QCD and its massless limit: an effective Lagrangian analysis. T.R.Taylor (Fermilab, Batavia, IL, USA), G.Veneziano, S.Yankielowicz.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.2, p.493-513 (6 June 1983).

Supersymmetric QCD is studied by an effective Lagrangian method. When all flavours are massive supersymmetric vacua, reproducing the known value of Witten's index, then decoupling of heavy flavours occurs. When one or more flavours become massless, some chirality breaking order parameters run to infinity suggesting a non-smooth zero mass limit, in contrast with the case of ordinary QCD. Possible implications of these results on chiral and/or supersymmetry breaking patterns in the massless theory are briefly discussed. (14 refs.)

74706 Chemical potential on the lattice. P.Hasenfratz, F.Karsch (CERN, Geneva, Switzerland).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.308-10 (2 June 1983).

The naive way of introducing chemical potential on the lattice leads to quadratic divergences even for free fermions. Starting from the analogy between the chemical potential and the fourth component of an abelian gauge field, a simple solution is proposed. For Wilson fermions it leads to a trivial modification of the hopping parameter of quarks propagating along the imaginary time direction. (8 refs.)

74707 Error estimate for the valence approximation to lattice QCD. W.Duffy (Dept. of Phys., Indiana Univ., Bloomington, IN, USA), G.Guralnik, D.Weingarten.

Phys. Lett. B (Netherlands), vol.125B, no.4, p.311-16 (2 June 1983).

A Monte Carlo algorithm is used to calculate m_N/m_p , m_Δ/m_p , m_Σ/m_p , m_π^2/f_π , f_π/m_p , f_π/m_π and Λ_{m}/m_p for lattice QCD with the number of flavors N_f of quarks contributing virtual loops given by zero, the valence approximation, and with N_f chosen, in effect to be -2 . The difference between corresponding

pairs of quantities with N_f of zero and N_f of -2 the authors take to be an estimate of the difference between the value for a realistic theory with N_f of $+2$ and for the approximate theory with N_f of zero. The changes in mass ratios and Λ_{m} are consistent with zero and typically $(20 \pm 20)\%$ while decay constant ratios change by as much as $(88 \pm 24)\%$. (10 refs.)

74708 On the low energy structure of QCD. J.Gasser, H.Leutwyler (Inst. für Theoretische Phys., Bern, Switzerland).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.321-4 (2 June 1983).

The authors analyze the low energy structure of off-shell amplitudes in QCD. The method used automatically keeps track of the Ward identities associated with chiral symmetry. The infrared singularities generated by the Goldstone bosons are shown to lead to substantial deviations from the soft pion results. (15 refs.)

74709 Quantum chromodynamics: the modern theory of the strong interaction. F.Wilczek (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

In book: *Annual review of nuclear and particle science. Vol.32*, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.177-209. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

The nature of the strong interaction responsible for holding nuclei together and for a wealth of phenomena observed in high energy collisions has been a main concern of physics since the 1930s. It now appears that we have a precise microscopic theory that in principle solves the problem, in the same sense that quantum electrodynamics solves atomic spectroscopy and chemistry. The author reviews the nature of the theory, the evidence for it, and its implications for other parts of physics. (108 refs.)

74710 Quaternionic formulation of fields associated with dyons. S.Raj Kumar, B.S.Rajput (Dept. of Phys., Kumaun Univ., Naini Tal, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.54

Summary form only given. In order to make an attempt for the confinement problems of quantum chromodynamics (QCD) and the existing manifestly non-covariant as well as clumsy formalisms for the theory of monopoles in usual Hilbert space, the authors have developed the quaternionic formulation for generalized field equations of the fields associated with dyons. They have also developed the quaternionic formulation for generalized potential, current Lagrangian and field with their interrelationship in presence of dyons. It has been shown that these compact forms of generalized fields associated with dyons are unique, consistent and reproduce the usual electrodynamics in the absence of magnetic charge on dyons.

74711 Gluonium and QCD in the J/ψ region. E.D.Bloom (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).

Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.149-77

The existence of an extensive spectrum of colorless, flavorless bound states of two or more gluons has been firmly predicted by quantum chromodynamics (QCD). These gluonic bound states have been given the rather unattractive name 'glueballs.' It is expected that the lower lying 'glueball' states are bound states of mostly 2 gluons and in analogy to quarkonium, this system is called gluonium. It is also expected that gluonium states should be by far easier to observe than other 'glueballs' due to their relatively lower masses which are predicted to lie in the range 1 to 2 GeV. However, the experimental search for such states has proven to be a difficult and confusing one. The author reviews these elements of 'glueball fantasy' and concludes that there is no easy way of experimentally establishing the existence (or non existence) of gluonium states. What is necessary to determine the gluonium content of a candidate state is a detailed comparison with theory, particularly QCD. But can one presently trust QCD to guide correctly? To partially answer this question, experiment is compared to the predictions of QCD in the J/ψ region. (54 refs.)

74712 The Upsilon resonances—recent results. M.G.D.Gilchriese (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).

Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.179-211

The discovery of the Upsilon at Fermilab in 1977 and the subsequent confirmation at the DORIS e^+e^- storage ring began a new era in the study of heavy quark systems. The Upsilon states are composed of b and \bar{b} quarks bound by the strong force. The study of the spectroscopy of the $b\bar{b}$ 'atom' may be crucial to the understanding of the strong interaction and, in the continued absence of the top quark, may be the only way to make precise comparisons with Quantum Chromodynamics, the theory of the strong interaction. In addition, the Upsilon resonances below B meson threshold primarily decay into gluons which subsequently fragment into hadrons. One therefore has a rather pure sample of gluons, the properties of which can be studied. In particular, the comparison of gluon and quark hadronization is facilitated. (23 refs.)

74713 Gluon condensation and confinement of quarks. R.Fukuda (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).

Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.58-61

The author considers if gluon condenses in the form of color singlet, then the dual variable becomes a good coordinate in the low energy region and acquires a mass gap. The vacuum of quantum chromodynamics will be filled with nontrivial configuration of gluonic fields $A_\mu^a(x)$; they condense in the vacuum in the form of color singlet and of Lorentz scalar. The author takes into account the effect of the gluon condensation and studies the vacuum state and excitation spectra. (4 refs.)

74714 Hadronic physics of qq light quark mesons, quark molecules and glueballs. S.J.Lindenbaum (Brookhaven Nat. Lab., Upton, NY, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.509-74 (30 refs.)

74715 Deep inelastic phenomena. C.Y.Prescott (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.677-733

Reviews the picture of nucleon structure from deep inelastic scattering. The subjects discussed include the quark-parton model, scaling, QCD, Q^2 evolution, structure functions, and the R parameter. (16 refs.)

12.35E Applications of quantum chromodynamics to particle properties and reactions

- 74716 Massive lepton pair production—what has QCD done to the classical Drell-Yan model? E.L.Berger (High Energy Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
AIP Conf. Proc. (USA), no.98, p.312-42 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).
A report is presented of recent experimental and theoretical progress in studies of the production of massive lepton pairs in hadronic collisions. Among the topics discussed are deviations from scaling, the status of the proofs of factorization in the parton model, higher-order terms in the QCD expansion, the discrepancy between measured and predicted yields (K factor), high-twist terms, soft gluon effects, and transverse momentum distributions. (46 refs.)
- 74717 Muoproduction of J/ψ and the photon-gluon scattering process: $\gamma g \rightarrow J/\psi g$. R.Baier (Lab. de Phys. Theorique et Hautes Energies, Univ. Paris-Sud, Orsay, France), R.Ruckl.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.2, p.289-96 (6 June 1983).
Recent data on muoproduction of J/ψ reported by the European Muon Collaboration are used to examine the perturbative QCD subprocess $\gamma g \rightarrow J/\psi g$ as a possible production mechanism. The authors find that for sufficiently inelastic J/ψ s this process can account for the observed rates and distributions. They argue, however, that in total only about 10 to 20% of the observed J/ψ yield is due to this source. (12 refs.)
- 74718 Use of final-energy sum rules to describe baryon properties in quantum chromodynamics and to estimate the proton lifetime in the SU(5) model. N.V.Krasnikov, A.A.Pivovarov, N.N.Tavkhelidze (Inst. of Nuclear Res., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.7, p.333-7 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.272-5 (5 Oct. 1982). [received: May 1983]
Final-energy sum rules are used to calculate the proton coupling constant λ_p with an interpolating proton current. The coupling constant λ_p can be used to calculate the matrix elements for proton decay in the grand unified SU(5) model. The proton lifetime is calculated to be $\tau_p = 10^{28} \times (M_X/10^{14} \text{ GeV})^4 \text{ yr}$, where M_X is the mass of the X boson. (12 refs.)
- 74719 Higher dimensional renormalization group invariant vacuum condensates in quantum chromodynamics. S.Narisson (CERN, Geneva, Switzerland), R.Tarrach.
Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.217-22 (26 May 1983).
The renormalization of the five- and six-dimensional scalar gauge invariant composite operators is performed. The corresponding renormalization group invariant vacuum condensates are studied. The main results are that the six-dimensional gluon condensate does not mix with the quartic quark condensates nor the other way round. The authors also show that the factorization hypothesis of the four-quark operator does not lead to renormalization group invariant quark vacuum condensates. So, one has to be careful when keeping the six-dimensional operators in the QCD sum rule analysis. (6 refs.)
- 74720 No threshold-effects from QCD in deep inelastic lepton scattering. W.Kummer (Inst. für Theoretische Phys., Tech. Univ. Wien, Wien, Austria).
Phys. Lett. B (Netherlands), vol.125B, no.4, p.317-20 (2 June 1983).
Within the usual system of assumptions, QCD, even in the presence of quark masses, predicts no threshold effects to one-loop order. The author derives this result in an extremely simple manner using a gauge-independent, but threshold-dependent momentum subtraction prescription. (11 refs.)
- 74721 Low energy theorems as precision tests of QCD. J.Gasser, H.Leutwyler (Inst. für Theoretische Phys., Bern, Switzerland).
Phys. Lett. B (Netherlands), vol.125B, no.4, p.325-9 (2 June 1983).
The authors work out the low energy expansion of the $\pi\pi$ -scattering amplitude with a method proposed in a previous paper (Phys. Letts., vol. 125B, no.4, p.321, 1983). Using the measured D-waves as an input they predict the behaviour of the amplitude to order p^4 . The data agree with this prediction within the errors. (8 refs.)
- 74722 What can we count on? A discussion of constituent-counting rules for interactions involving composite systems. D.Sivers (Argonne Nat. Lab., Argonne, IL, USA).
In book: *Annual review of nuclear and particle science*. Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.149-75. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]
The author discusses QCD predictions for the hadronic form factors. The pion form factor is considered in some detail but he also looks at baryon form factors. Counting-rule predictions for the shape of deep inelastic structure functions are presented and QCD-based approaches to hadronic fixed-angle scattering are considered. (40 refs.)

- 74723 Spectroscopy of hadrons: mesons. S.P.Misra, A.R.Panda, S.Naik (Inst. of Phys., Bhubaneswar, India).
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.69
Summary form only given. The authors consider the spectroscopy of hadrons with QCD inspired or other phenomenological potentials with a standard diagonalisation procedure using the oscillator basis. In the present model, they retain the four-component complete Dirac operator so that relativistic spin and orbital dependence as well as kinematics is fully retained. The energy eigenvalues are obtained by the optimisation of the energy expectation values, subject to the constraint of the appropriate normalisation of the wave functions. This enables one to retain the relativistic effects completely. The corrections to the wave functions within the same multiplet even in the 'nonrelativistic' case of the charmonium appear to be substantial.
- 74724 QCD and the space-time evolution of high-energy e^+e^- , $p\bar{p}$, and heavy ion collisions. J.D.Bjorken (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.343-68
The author concentrates on the space-time evolution of hadronic final states in various processes. It has been known for a long time that large distances are important at high energies, and that one therefore should be able to at least map out the basic space-time geography of the collision process. It must be admitted that so far, the space-time pictures have not led to very much in the way of practical (computational) insights, but given the present QCD ideology, it may be useful to look at the subject again. He begins with a discussion of e^+e^- annihilation into hadrons, a process blessed with well-known elements of simplicity. Then he considers the opposite extreme of highly relativistic nucleus-nucleus collisions. Here a space-time description has its own elements of simplicity, elements which might conceivably be applicable in hadron-hadron collisions. He then addresses the more immediate issues of how these ideas relate to present-day observations, especially high-energy hadron-hadron collisions. (40 refs.)
- 74725 Hadronic production of heavy flavours. L.Montanet (CERN, Geneva, Switzerland).
Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.369-86
Heavy quarks (i.e. charm c and Beauty b) turn out to be very useful probes to study hadron dynamics. There are good reasons to hope that the QCD perturbative theory can be applied to understand the production of heavy quarks in hadronic collisions, assuming the gluon-gluon fusion process $g\bar{g} \rightarrow Q\bar{Q}$ or the quark-quark fusion process $q\bar{q} \rightarrow Q\bar{Q}$. - 74726 The de Broglie fusion method applied to quarks at the ends of strings. C.J.Burden, L.J.Tassie (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Ann. Inst. Henri Poincaré Sect. A (France), vol.38, no.3, p.199-213 (1983).
Wave equations are found for diquarks restricted to a world line traced out by the end of a relativistic string. The method used involves combining two restricted Dirac equations using a variant of the de Broglie fusion method. The equation describing the spin 0 diquark is the Klein-Gordon equation restricted to the world line. However, the spin 1 diquark equation differs from the restricted Proca-de Broglie equation. (5 refs.)
- 74727 The axial anomaly at finite temperature. H.Itoyama, A.H.Mueller (Dept. of Phys., Columbia Univ., New York, NY, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.2, p.349-65 (6 June 1983).
The axial anomaly and its constraints are examined at finite temperature. The axial anomaly is shown to be the same at $T \neq 0$ and $T=0$. When $T \ll \Lambda$ one is able to argue the existence of a narrow resonance in the QCD medium corresponding to pion propagation. However, when T is comparable to Λ one is unable to obtain any useful information from the axial anomaly. In particular, one is unable to see how $T_{\text{chiral}} \geq T_{\text{conf}}$ might follow from the anomaly constraint. (12 refs.)

74728 Instantons in the quark plasma. A.A.Abriksov, Jr. (Space Res. Inst., Moscow, USSR). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.459-83 (6 June 1983).

The thermodynamics of a dense plasma of light quarks is studied by means of exact Green functions. The author constructs the fermion propagator in a self-dual field at non-zero density and temperature. The fermion zero modes in the medium are considered with special attention. The non-diagonal elements of the density matrix generate an additional term in the instanton action in the one-loop approximations. Large pseudoparticles are suppressed by the medium and the instanton gas is dilute. The contribution to the thermodynamic functions is proportional to the total 4-volume occupied by pseudoparticles. Due to the product of the quark masses in the coefficient, the instanton density is small. Interaction of pseudoparticles with the 'quark condensate' $\langle 0|q\bar{q}|0\rangle$ in the physical vacuum of QCD enhances their influence and makes it quite notable. (15 refs.)

74729 Symmetry basis and physical basis for many-quark system. Shi Yi-jin (Inst. of Atomic Energy, Acad. Sinica, Beijing, China). *Commun. Theor. Phys. (China)*, vol.1, no.4, p.459-68 (1982).

A general expression for transformation coefficients between the symmetry basis and physical basis of the many-quark system has been given. For the channel with $(\text{TS})=(01)$ of a six-quark system, the transformation coefficients have been calculated. Interpreting again the fractional-parentage expansions of symmetry basis, the author pointed out that the fractional-parentage coefficients are essentially the Clebsch-Gordan coefficients for the corresponding SU_6 group. (4 refs.)

74730 On scalar quark leakage in Klein-Gordon equation. A.P.Kajwadkar, L.K.Sharma (Dept. of Appl. Phys., Government Engng. Coll., Jabalpur, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.3, p.195-6 (March 1983).

A tunnelling phenomenon for two different confining potentials depicting the leakage of scalar quarks has been discussed. The transmission coefficients for these cases have been evaluated numerically and compared with those for the linear potential. (11 refs.)

74731 An analysis of (bb) -states in a static one-parameter potential model. A.Steiger (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.223-6 (26 May 1983). Masses and leptonic widths of (bb) -states are calculated with the potential $V(r)=[8\pi/(33-2N_f)](1-\lambda^2)/(r \log \lambda r)$. Particularly good agreement with recently published experimental results, including the average mass of the three observed P-wave states χ'_{bb} , is obtained for the constituent quark mass $m_b=4.735$ GeV, the OCD-parameter $\Lambda=\exp(-\gamma_E) \lambda=362.2$ MeV, and the number of active flavors $N_f=4$. (17 refs.)

74732 Can δ (980,0⁺) be a broad $qqqq$ state? N.N.Achasov, S.A.Devyanin, G.N.Shestakov (Dept. of Theoretical Phys., Inst. for Maths., Novosibirsk, USSR).

Phys. Scr. (Sweden), vol.27, no.5, p.330-3 (May 1983). It is shown that none of the arguments, presented by Bramon and Masso, against the possibility of interpreting the δ (980,0⁺)-resonance as a broad $qqqq$ -state and concerning (i) the $\eta \rightarrow \eta\pi\pi$ decay, (ii) the $D,E \rightarrow \delta\pi \rightarrow \pi\pi$ decays, (iii) the tadpole contributions to EM mass differences and mixings, is well founded, and some of them are plainly wrong. The authors discuss Tornqvist's resolution of the scalar mesons. (21 refs.)

74733 Antiquarks in a quark-gluon plasma. A.Mekjian (Dept. of Phys., Rutgers Univ., Piscataway, NJ, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.138. Thermal properties of a heated system of quarks and gluons are investigated and compared to those of a system of nucleons and pions. Results are first given for a non-interacting system or asymptotically free system of quarks, antiquarks and gluons. Confinement is incorporated through the MIT Bag Model. The energy, density, pressure and entropy are calculated in an expansion in powers of μ_0/kT , where μ_0 is the quark chemical potential and T is the temperature of the system. The nuclear system is investigated using a density dependent effective interaction. The phase transition from nucleonic to quark matter is studied using the Gibbs' criteria. Specifically, phase equilibrium is established when the pressure and temperature of the two phases are equal and when the nucleon chemical potential is three times the quark chemical potential. (2 refs.)

74734 Baryon multiplicities in the (six quark) deuteron fragmentation. P.Pal (Uluberia Coll., Uluberia, India), P.Dasgupta, K.Dasgupta.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.62. Summary form only given. The multiplicities for various baryons produced in the deuteron fragmentation are studied on the basis of a six-quark picture of deuteron. Multiplicities of various types of baryons are expressed in terms of the probabilities A_{ij} , $i, j=0, 1, 2, 3$ with i indicating the number of valence quarks of the incident deuteron contained in any one of the two baryons produced in each collision and j denoting that in the other. Experimentally verifiable constraints on the multiplicities are shown to result from the positivity of A_{ij} . The possibility of determination of the quantities $v_i=\sum_j (\delta_{ij}+A_{ij})$ is also discussed. The results obtainable from the conventional two-nucleon picture of deuteron are also given and are compared with those obtained from the six-quark picture. It is shown how one can experimentally distinguish between the two pictures through a study of baryon multiplicities.

74735 Hadronic couplings of open beauty states. S.N.Ram (Dept. of Phys., Banaras Hindu Univ., Varanasi, India), C.P.Singh.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.66.

Summary form only given. Strong interaction coupling parameters of particles with beauty quantum number are obtained using dispersion sum rules in various forms, e.g. current algebra sum rules, superconvergence sum rules and finite energy sum rules, etc. These sum rules lead to a set of algebraic relations among masses and coupling constants. The authors compare the hadronic couplings of beautiful particles as obtained from various techniques and discuss their implications on the hadronic production of these states.

74736 Confining potentials and analyticity of energy levels in angular momentum plane. D.P.Datta, B.Mukherjee (Dept. of Phys., North Bengal Univ., Darjeeling, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.72.

Summary form only given, as follows. Analyticity of Schroedinger energy levels $E_n(l)$ in the half-plane $\text{Re } l > -1/2$ have been studied for confining

potentials of the type $V(r)=r+k\beta^{\beta}$, $-2<\beta<1$, k real or $r^{\alpha}+k\beta^{\beta}$, $0<\beta<\alpha$, k real, which reduce to the well-known charmonium potential for $\alpha=1$, $\beta=-1$. Use has been made of the Rellich-Kato theory for linear operators. It is first shown that the energy levels $E_n(\beta)$ are analytic in β in the interval (i) $-2<\beta<1$, $\alpha=1$; (ii) $0<\beta<\alpha$, $\alpha\neq 1$, for a fixed l in $\text{Re } l > -1/2$. The proof rests on the realization of a family of Schroedinger operators holomorphic in β in the specified interval for a fixed l in $\text{Re } l > -1/2$. Analyticity of $E_n(l)$ for pure power potential ($\beta=0$) is already known. A simple argument, based on the analyticity property in β , now proves the analyticity of $E_n(l)$ in $\text{Re } l > -1/2$ for a non-zero β , since it is known to be true for $\beta=0$.

74737 Gluonic and relativistic effects in harmonic oscillator model. A.Sharma, M.Gupta, M.P.Khanna (Dept. of Phys., Panjab Univ., Chandigarh, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.75.

Summary form only given, as follows. The harmonic oscillator quark model wherein Pauli spinors are replaced by Dirac spinors and quark masses are less than one-third of the nucleon mass, it studied in the spirit of the bag model. In particular, the authors have calculated G_A/G_V , μ_p , charge radius of proton, and their variation with quark mass and spring constant. They have also calculated certain gluon probability integrals. The trend of their result is the same as those of Golowich and Close et al., similarly the spatial matrix elements of non-leptonic decays are found to be of right order of magnitude. They demonstrate that the results of the standard bag model as well as those of non-relativistic HO model are reproducible in appropriate limits of the present scheme.

74738 The dynamics of a fragmentation model or a possible life after the parton stage. B.Andersson (Dept. of Theoretical Phys., Univ. of Lund, Lund, Sweden).

Physics in Collision. High-Energy $ee/ep/pp$ Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.303-26.

The author discusses how perturbative QCD works at distances much less than 1 fm. (24 refs.)

74739 Quark masses from the vector meson spectrum. E.Etim (Phys. Dept., Siegen Univ., Siegen, Germany).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.343-65.

Considers the relationship between quark masses and the masses of their neutral vector meson bound states. This is done by studying the properties of the hadronic contribution to the photon propagator to second order in the electric charge. For low energies the corresponding vacuum polarisation amplitude is dominated by vector mesons while at high energies the quark structure of the current takes over. These two structures are required to match asymptotically. (13 refs.)

74740 Exotic multi-quark states with charm. H.J.Lipkin (Fermi Nat. Accelerator Lab., Batavia, IL, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.599-625.

The author describes some threshold exotics and multi-quark hadrons such as dimesons and dinucleons. This is then expanded to discuss multi-quark states which include charm, and models which describe the hadron structure. A nonrelativistic quark model is used. Mass formulae are given for mesons and baryons. (22 refs.)

12.35K Other composite models (inc. composite quarks and leptons)

- 74741** Generalized statistics and the rishon hypothesis. P.D.Jarvis (Dept. of Phys., Univ. of Tasmania, Hobart, Tasmania, Australia), H.S.Green. *Aust. J. Phys. (Australia)*, vol.36, no.2, p.123-6 (1983). It is pointed out that the proposal of Harari and others (1981), that leptons and quarks should be regarded as composites, consisting of rishons or quips, can be formulated as a field theory in terms of two fundamental spinor fields which satisfy a new generalization of quantum statistics. The requirement of macroscopic causality determines which of the many combinations of rishons may be observed as isolated particles. (14 refs.)
- 74742** A derivation of the Cabibbo angle and quark-lepton masses from a composite model. G.C.Yang (Hobei Inst. of Technol., Tianjin, China), H.C.Liu, L.F.Luo. *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.3, p.111-15 (21 May 1983). The Cabibbo angle and quark-lepton masses are derived from a composite model by taking into account the interaction between the internal degrees of freedom. (4 refs.)

12.40H Duality and dual models

- 74744** Superstring interactions. M.B.Green, J.H.Schwarz (California Inst. of Technol., Pasadena, CA, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.43-88 (30 May 1983). As a first step in the construction of a superstring field theory, the off-shell vertex for coupling three arbitrary open superstring states is constructed. A cubic interaction term in the supersymmetry charge is also obtained. Since the hamiltonian corresponds to the square of this supercharge, certain quartic interactions can be deduced as well. It appears likely, however, that the complete field theory of superstrings contains quartic and higher interactions in addition to those obtained here. (12 refs.)
- 74745** Spectrum of the supersymmetric Liouville theory. J.F.Arvis (Lab. de Phys. Theorique, Ecole Normale Supérieure, Paris, France). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.309-20 (6 June 1983). The author completes a previous paper (1983) on the supersymmetric Liouville theory in a box by explicitly working out the mode separation and obtaining the spectrum. The results are relevant for the theory of the spinning string in Polyakov's quantization. (7 refs.)
- 74746** The physics of dual vortices and static baryons in 2+1 dimensions. N.J.Snyderman (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.2, p.381-422 (6 June 1983). The dual to Mandelstam $SU(N)$ models of magnetic confinement, which explicitly realize the superconducting phase of the $SU(N)$ gauge theory, are constructed and shown to explicitly realize 't Hooft's physical picture of the confining phase in 2+1 dimensions, in which electric vortices are Bloch walls between Z_N^* magnetic domains. These models generalize Polyakov's $SU(2) \rightarrow U(1)$ compact QED model to $SU(N) \rightarrow U(1)^{N-1}$. These models have also been considered by Wadia and Das (1981). Static baryons in $SU(3)$ are studied. A Hamiltonian analysis of the physics of confinement in these models is used to elucidate the beautiful correspondence of Hosotani (1977) that the electric vortex in the Polyakov model is related to the naive dual of a magnetic vortex in the insulating layer of a Josephson junction. (31 refs.)

- 74747** Generalized string amplitude and wave equation for hadrons. H.Suura (School of Phys. & Astron., Univ. of Minnesota, Minneapolis, MN, USA). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.62-4. A gauge invariant Hamiltonian formulation of hadron dynamics involving a generalized string amplitude is proposed. Resulting partial integro-differential wave equations reflect the shielding of the long range potential and determine a universal logarithmic derivative of the hadronic wave functions. Because of this boundary condition, the new wave equation allows confined solutions without an explicit confinements potential in it. (2 refs.)
- 74748** Quantized strings and QCD. E.S.Fradkin, A.A.Tseytlin (Dept. of Theoretical Phys., P.N. Lebedev Phys. Inst., Moscow, USSR). *Gauge Theory and Gravitation. Proceedings of the International Symposium, Nara, Japan, 20-24 Aug. 1982* (Berlin, Germany: Springer-Verlag 1983), p.284-92. The authors present various quantised string models for $N_d = \infty$ QCD, the QCD strings having quarks at the ends. Meson scattering amplitudes are calculated, starting with the QCD path integral. - 74749** CFF-shell effects in VDM and the Compton sum rule. A.Nandy. *Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982* (Bombay, India: Dept. Atomic Energy 1982), p.61. Summary form only given. It has been recognised for some time that the traditional attempts to compare Compton cross-section to vector meson nucleon scattering through VDM fall short of the experimental results by an overall normalization factor of around 2. The author has observed that similar problems in the case of radiative decays of vector mesons can be adequately explained by considering the off-shell effects in a generalised VDM and that this formalism also predicts the total VN cross-sections satisfactorily. The author applies the off-shell corrections to the Compton process and indicates that a closer fit can be obtained to the experimental results than in traditional VDM.

12.70 HADRON MASS FORMULAS

- 74750** On a mass formula of particles in $c\bar{c}$, $b\bar{b}$ and $t\bar{t}$ families. S.N.Banerjee, A.K.Sarker (Dept. of Phys., Jadavpur Univ., Calcutta, India). *Hadronic J. (USA)*, vol.6, no.2, p.440-54 (March 1983). A mass formula containing the masses of the constituent quarks, the radii of the particles and the potential parameters for the S-states of $c\bar{c}$, $b\bar{b}$ and $t\bar{t}$ families, has been suggested in the framework of the statistical model and the computed masses compare favourably with the corresponding experimental data. - 74751** Recent results from PEP. R.Weinstein (Univ. of Houston, Houston, TX, USA). *AIP Conf. Proc. (USA)*, no.98, p.126-45 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982). Recent results from PEP are presented. In electroweak interactions the measured charge asymmetries for $e\bar{e} \rightarrow \mu\bar{\mu}$, $\tau\bar{\tau}$, and $e\bar{e} \rightarrow e\bar{e}$ are reported. Results are given for lifetime measurements of the τ lepton, D^0 meson, and b quark, and measured branching ratios for the τ are given. QED tests of the electron propagator and muon compton scattering are reported. In strong interactions, measurements are reported for R, and Energy-Energy Correlation measurements of α_s are given. Flavor tagging measurements are reported, including multiplicity and α_s for samples enriched in c and b, and fragmentation functions are reported for c and for b. The results of searches are also presented for 10 postulated particles. (12 refs.)
- 74752** Experimental e^+e^- physics. D.H.Saxon (Rutherford Appleton Lab., Didcot, England). *Hadronic J. (USA)*, vol.6, no.2, p.455-622 (March 1983). Electron-positron physics at high energies is reviewed, with particular emphasis on the physics underlying the experimental methods. This report is based on lectures given at the 12th British Summer School in Theoretical Physics, and is intended to be didactic rather than comprehensive. Results are included up to September 1982. (148 refs.)
- 74753** Nonlinear effects in colliding $\gamma\gamma$ beams. Ya.T.Grinchishin, M.P.Rekalo. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.781-3 (May 1983). In Russian. When a low energy, high intensity photon beam interacts with a relativistic electron beam, there appear a number of qualitative properties characterised by nonlinear effects. The maximum energy of the created photons increases due to the absorption of two (or more) initial photons. Since the effective mass of an electron in an intense EM field is larger than that of a free electron, then the maximum energy of photons due to the reverse Compton effect decreases. (8 refs.) V.G.P.

74754 Test of quantum electrodynamics and the study of heavy leptons. S.C.C.Ting (MIT, Cambridge, MA, USA). The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.735-79. In the last decade there have been many experiments designed to test the validity of quantum electrodynamics and to study heavy leptons. In earlier days one performed experiments of the type $\gamma + A \rightarrow A + e^+ + e^-$, whereby one checked the electron propagators at small distances. These types of experiments are limited to an accuracy of $\approx 5\%$ by the lack of precise knowledge of nuclear form factors and by the difficulty in monitoring the incident photon flux. With the construction of e^+e^- and e^-e^- colliding beams, one can by-pass most of these difficulties, as there is a purely electrodynamic system (to order α^2) and one can use the low-momentum-transfer part of the interaction (as in the small-angle $e^+e^- \rightarrow e^+e^-$ process) to monitor the interaction rate and compare the large-angle (with large-momentum transfer) part of the interaction with the prediction of QED, such as angular distributions, energy dependence, etc. (31 refs.)

74755 e^+e^- physics at PETRA. P.Duinker (Nat. Inst. for Nuclear & High Energy Phys., Amsterdam, Netherlands). The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.873-1064. Reviews the PETRA e^+e^- collider and the experiments performed there. These include QED tests, electroweak model tests, two-photon interactions, hadron jets and QCD tests. (118 refs.)

13.15 NEUTRINO INTERACTIONS

(inc. interactions involving cosmic rays)

74756 Observation of neutrino and antineutrino induced coherent neutral pion production off Al^{27} . H.Faissner, E.Frenzel, M.Grimm, T.Hansl-Kozanecka, D.Hoffmann, E.Radermacher, D.Rein, H.Reithler, U.Samm, L.M.Schgal, H.Tuchscherer, H.de Witt (III Phys. Inst., Tech. Hochschule Aachen, Aachen, Germany), M.Baldo-Ceolin, F.Fobisut, H.Huzita, M.Loret, G.Puglieri.

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.230-6 (26 May 1983). The angular distribution of isolated π^0 s, produced by ν_μ s and $\bar{\nu}_\mu$ s in the Aachen-Padova spark chamber, shows a peak in the forward direction which is not explicable by resonance production. A similar effect is seen in the acoplanarity distribution of the decay photons, which shows an excess of nearly coplanar events. A control sample containing a recoil proton shows no such peaks and is well reproduced by a resonance model. The observed effects are consistent with neutral current (NC) induced coherent single π^0 production off the entire Al^{27} nucleus. The coherent cross sections are $\sigma^+ = (29 \pm 10) \times 10^{-40}$ cm²/nucleus and $\sigma^- = (25 \pm 7) \times 10^{-40}$ cm²/nucleus. They determine the isovector axial NC coupling constant $\beta = 0.93 \pm 0.12$. No η^0 mesons were observed, which limits the corresponding isoscalar coupling constant to $\delta < 0.7$ (with 90% confidence). (17 refs.)

74757 Charged-current neutrino interactions. H.E.Fisk (Fermilab, Batavia, IL, USA), F.Sciulli.

In book: *Annual review of nuclear and particle science*. Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.499-573. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4].

This article is primarily intended to review the status of the deep inelastic, charged-current scattering of neutrinos from nucleons. Processes of the form, $\nu_\mu + N \rightarrow \mu^- + X$, have been an important subject for research since such processes were found to have the profound simplicity referred to as scaling. The authors show how the general features of the scaling hypothesis follow from the assumption of nearly free quarks inhabiting the nucleon, and derive the relevant formulae from a simple, physical picture. They also briefly review the relevant properties of the neutrino, its charged-current interactions with other elementary targets, the quark model of nucleon structure, and anticipated form of the inelastic cross section, and the tests and complications of the quark model using deep inelastic data. (174 refs.)

74758 Behaviour of charged particles multiplicities in deep inelastic processes. R.P.Bajpai, Yogesh (Dept. of Phys., Pradesh Univ., Simla, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.68.

Summary form only given, as follows. The almost complete absence of any scaling violations in the total charged particles multiplicities observed in neutrino processes is sought to be understood in the framework of evolution equations. The recent data on charged pion production in e^+e^- annihilation are analysed and a parametrization of fragmentation function is obtained.

13.20 LEPTONIC AND SEMILEPTONIC DECAYS OF MESONS

74759 Prompt neutrino results from Fermilab. R.C.Ball, C.T.Coffin, H.R.Gustafson, L.W.Jones, M.J.Longo, T.J.Roberts, B.P.Roe, E.Wang (Univ. of Michigan, Ann Arbor, MI, USA), M.E.Duffy, G.K.Fanourakis, R.J.Loveless, D.D.Reeder, D.L.Schumann, E.Smith, M.B.Crisler, J.S.Hoftun, T.Y.Ling, T.A.Romanowski, J.T.Volk, G.Conforto, C.Castoldi, S.Childress. *AIP Conf. Proc. (USA)*, no.98, p.262-73 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

Results from a Fermilab experiment to study prompt neutrino production are presented. Assuming the prompt neutrinos come from the decay of charmed mesons a total DD production cross section of approximately $20 \mu\text{b}/\text{nucleon}$, is found in good agreement with previous CERN results. They find a $\bar{\nu}/\nu$ ratio and a ν_e/ν_μ of approximately 1.0. The energy and p_T spectra of the prompt neutrinos are consistent with those expected from DD production. Limits on the production of supersymmetric particles have also been obtained. (12 refs.)

74760 Recent results from CLEO at the $\Upsilon(4s)$. S.E.Csorna (Dept. of Phys. & Astron., Vanderbilt Univ., Nashville, TN, USA).

AIP Conf. Proc. (USA), no.98, p.358-80 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

Inclusive properties of B meson decays, are studied. An upper limit is placed on $|b_{\bar{u}u}/b_{\bar{c}c}| < 0.2$ from semi-leptonic decays. Non-standard models are ruled out. (17 refs.)

74761 Manifestation of the axial photon in decays of charged $K[\pi]$ mesons. L.M.Slad' (Sci.-Res. Inst. of Nuclear Phys., M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.570-2 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.615-18 (July 1982). [received: April 1983]

The author discusses the decay $K \rightarrow \mu \nu \gamma$. The background imitation of this mode of decay arises principally from the radiative decay $K \rightarrow \mu \gamma$ in connection with possible losses of a γ quantum (of course the equipment which records the γ must possess 4π -steradian geometry). Therefore, it is very important to measure the inefficiency L_γ of the detection of the γ quanta in the entire range of their permissible energies. He analyzes the region with muon kinetic energies T_μ from 60 to 100 MeV. (9 refs.)

74762 Detecting t-quark pairs at $\bar{p}p$ colliders using transverse dilepton masses and jets. V.Barger, A.D.Martin, R.J.N.Phillips.

Report RL-83-025, Rutherford Appleton Lab., Chilton, Oxon., England (March 1983), 14 pp.

Hadronic t production with semileptonic decays of either or both t and \bar{t} quarks gives distinctive transverse-momentum correlations of electrons (or muons) and neutrinos. Multiple semileptonic modes of the $t \rightarrow b c s$ decay cascades are statistically quite probable, but explicit calculations show that they scarcely affect the $\nu\nu$ correlations. Opposite sign dileptons, coming mainly from primary semileptonic decays of t and \bar{t} together, have correlations that also reflect the t quark mass but less decisively than the $\nu\nu$ correlations. Events with large missing p_T and no identified leptons are also expected, at a rate comparable to high p_T charged leptons. Distinctive broad jet signatures are also expected for all these events, with specific correlations of the trigger lepton and jet momenta. (18 refs.)

13.25 HADRONIC DECAYS OF MESONS

74763 The pion-quark coupling constant and the decay of vector mesons. A.Suzuki, R.K.Bhaduri (Dept. of Phys., McMaster Univ., Hamilton, Ontario, Canada).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.347-50 (2 June 1983). The decay processes of vector mesons, like $\rho \rightarrow \pi\pi$ and $\rho \rightarrow \pi\gamma$, are considered in a model where the pions couple directly with the quarks. The coupling strength extracted from such decays is shown to be consistent with theoretical estimates. (15 refs.)

74764 Why most flavor dependence predictions for nonleptonic charm decays are wrong. H.J.Lipkin (Fermi Nat. Accelerator Lab., Batavia, IL, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.389-413.

The discovery of charmed particles with many open channels for nonleptonic decays has provided a new impetus for a theoretical understanding of these decay processes. The GIM current provides a well defined weak hamiltonian, which can justifiably be used to first order. The QCD approach to strong interactions gives flavor-independent couplings and flavor symmetry broken only by quark masses. In a model with n generations of quarks and $2n$ flavors, a flavor symmetry group $SU(2n)$ can be defined which is broken only by H_{weak} and the quark masses. Here again, the same two approaches of symmetry and dynamics have been used. However, both types of treatment tend to consider only the symmetry properties or dominant diagrams of the weak interaction, including some subtle effects, while overlooking rather obvious effects of strong interactions. This leads to incorrect predictions. (16 refs.)

13.30 DECAYS OF BARYONS

74765 Proton decay experiment in the Kolar Gold Fields. M.R.Krishnaswamy, M.G.K.Menon, N.K.Mondal, V.S.Narasimham, B.V.Sreekantan (Tata Inst. of Fundamental Res., Bombay, India), Y.Hayashi, N.Ito, S.Kawakami, S.Miyake.

AIP Conf. Proc. (USA), no.96, p.168-74 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

In total 6 events of special type have been recorded so far in the Kolar Gold Fields experiment. Out of them, three events are fully confined to the detector volume. It is shown that their characteristics are in conformity with the decay of bound nucleons and the background due to neutrino interactions is extremely small. Based on these events, it is suggested that a mean lifetime of protons is about 8×10^{30} years. (4 refs.)

74766 The Mont Blanc experiment on nucleon stability. G.Battistoni (Lab. Nazionali, INFN, Frascati, Italy), E.Bellotti, G.Bologna, P.Campagna, C.Castagnoli, V.Chiarella, D.C.Cundy, B.D'Ettorre Piazzoli, E.Fuorini, E.Iarocci, G.Mannocchi, G.P.Murtas, P.Negri, G.Nicoletti, G.Mannocchi, G.P.Murtas, P.Negri, G.Nicoletti, P.Picchi, M.Price, A.Pullia, S.Ragazzi, M.Rollier, O.Saavedra, L.Trasatti, L.Zanotti.

AIP Conf. Proc. (USA), no.98, p.19-23 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

The Mont Blanc experiment has recorded four fully contained events with at least a 10 cm track in iron. Two events have a single track interpreted as a muon due to a quasi elastic neutrino interaction with a total visible energy around 400 MeV. The third one is a neutrino inelastic interaction of ~ 1.5 GeV energy. The fourth event, whose energy is around 1 GeV, cannot be easily identified as a neutrino. In order to study the possibility that this event is due to an inelastic interaction of a ν the authors have analysed 400 neutrino events collected in a calibration test performed at CERN, exposing a part of the final detector to an unfocused ν beam which simulated the expected spectrum of atmospheric neutrinos. (4 refs.)

74767 The effective proton lifetime and non-exponential decay. G.N.Fleming (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.287-90 (2 June 1983). Noting that in GUT models protons must be in the very early stage of the decay process. The author establishes a lower bound on the observable effective lifetime, depending on the ratio of the RMS deviation of the proton energy spectrum to the theoretically calculated width. He finds that if this ratio ranges from $10^{10 \pm 1}$ to 1, the lower bound on the effective lifetime climbs from $10^{30 \pm 2}$ yr to $10^{50 \pm 2}$ yr. He also argues that if protons are to avoid a form of kinematical fragmentation for one theoretical lifetime, then the effective lifetime for present-day protons is longer than 10^{36} yr. (9 refs.)

74768 Certain rare hypernuclear decays. V.A.Lyul'ka. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.649-55 (May 1983). In Russian. Hypernuclear decays with production of γ -quanta as well as Dalitz pairs induced by the radiative and conversion decays of Λ -particles ($\Lambda \rightarrow n + \gamma$ and $\Lambda \rightarrow n + e^+ + e^-$, respectively) are discussed. The hypernuclei are considered to be useful for the investigation of these decays because in this case charged particles will take part in hypernuclear decays. Besides, nuclear spin selection rules are available restricting the number of form factors in a matrix element. Decays with production of several nuclei and nucleons can manifest an appreciable effect of the strong final-state interaction. The hypernuclear decays with production of leptons and π -mesons are briefly discussed as well. (19 refs.)

74769 The decay of heavy flavor states in e^+e^- annihilations. T.A.Ferguson (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA). Physics in Collision. High-Energy $ee/pp/pp$ Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.387-403

The author reviews the recent results from e^+e^- experiments on the weak decays of particles containing charm or beauty. (35 refs.)

74770 Experiment to detect proton decay and neutrino oscillations (using cosmic ray neutrino events). D.B.Cline (Fermilab, Batavia, IL, USA). The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.307-42

A large water Cherenkov detector is being constructed in a deep mine at Park City, Utah by a collaboration of Harvard, Purdue and Wisconsin physicists. The purpose of the detector is to observe proton or bound neutron decay to lifetimes of 0.7×10^{33} years. The detector is designed to be sensitive to several decay modes of the proton and to suppress the backgrounds that are naturally associated with cosmic ray muon and neutrino interactions in the walls of the mine or the overburden of the site. 74771 Analysis of scaling violation in nucleon structure functions. V.V.Ammosov, V.A.Gapienko, G.S.Gapienko, A.G.Denisov, V.G.Zaets, V.I.Klyukhin, V.I.Koreshev, P.V.Pitukhin, V.I.Sirotenko, E.A.Slobodyuk, Z.U.Usubov, P.A.Gorichev, V.I.Efremenko, S.P.Kruchinin, M.A.Kubantsev, I.V.Makhlyueva, A.V.Fedotov, V.I.Shekelyan, J.P.Berge, D.Bogert, J.Malko, F.A.Nezrick, R.Orava, R.Hanft, R.Endorf (Inst. of High-Energy Phys., USSR).

JETP Lett. (USA), vol.36, no.8, p.367-71 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.8, p.300-4 (20 Oct. 1982). [received: June 1983]

Some new measurements of the nucleon structure functions F_2 and xF_3 have been carried out in an antineutrino experiment with a 15-foot bubble chamber. The structure functions are analyzed. The scaling violation in xF_3 can be described by quantum-chromodynamics effects with the scaling parameter $\Lambda_{QCD} \approx 0.3$ GeV and also by higher-twist effects. (10 refs.)

74772 Structure functions of relativistic systems composed of two spin $1/2$ particles. A.D.Linkevich, V.I.Savrin, N.B.Skachkov (Joint Inst. for Nuclear Res., Dubna, USSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.955-62 (Oct. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.20-31 (Oct. 1982).

Expressions are obtained for the structure functions of mesons in terms of the solutions of a covariant two-particle equation for the spin wave function of the system. (21 refs.)

74773 Electric-dipole moments of particles. N.F.Ramsey (Mount Holyoke Coll., South Hadley, MA, USA).

In book: *Annual review of nuclear and particle science*. Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.211-33. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

Experimental measurements and theoretical predictions of electric-dipole moments are possible for many different particles, including neutrons, protons, electrons, muons, and hyperons, but the most sensitive tests of theories have

so far come from the neutron. The reason for this is the neutron's zero electric charge. (118 refs.)

74774 Magnetic moments of the ground state baryons. M.Gupta, N.Kaur (Dept. of Phys., Panjab Univ., Chandigarh, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.55

Summary form only given, as follows. Baryon magnetic moments are calculated in the harmonic oscillator quark model incorporating: (i) a natural mass scale for quarks, taken as one-third of the nucleon mass for u and d quarks and the strange quark mass suggested by Lipkin's sum rule $m_u = m_d = m_{\Lambda} - m_p$, (ii) a minimal nontrivial mixing, viz., $|8^{1/2}_2\rangle = \cos\phi/(56.0^+)^{N=0} + \sin\phi/(70.0^+)^{N=2}$ and (iii) replacement of Pauli spinors by Dirac spinors for including relativistic corrections. In the parameter free non-relativistic limit, the authors find an excellent fit which gets further improved in the relativistic case.

74775 Magnetic moments in quark-diquark model. R.C.Verma (Dept. of Phys., Kumaun Univ., Naini Tal, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.56

Summary form only given. In recent years, improved measurements of the hyperon moments have become available. The naive quark model does not yield complete agreement with the data. In particular low Σ^+ and large Ξ^- moments seem to require additional effects either in electromagnetic Hamiltonian or in the baryon wave functions. The author studies SU(6) breaking effects on baryon moments in the framework of quark-diquark model. SU(6) symmetry of the wave function is broken by assigning different probability to spin triplet and singlet diquarks, which can be controlled through a mixing angle. The author finds that such DH(6) breaking leads to nice agreement between theory and experiment. The author also observes that similar results also follow with wave functions modified due to quark-quark interaction mediated by gluon exchange.

74776 Deep inelastic muon hadron interactions.

AIP Conf. Proc. (USA), no.98, p.402-11 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

Recent results in muon scattering from the EMC collaboration are presented on the fragmentation properties of quarks and the jet structure of deep inelastic interactions. The measurement of the structure function ratio $R = \sigma_L/\sigma_T$ is reported and also the new result of a measurement of the ratio $F_2^{(n)}(\text{Fe})/F_2^{(n)}(\text{D})$ which shows a totally unexpected behaviour as a function of x. (19 refs.)

74777 Spin correlation in $ep \rightarrow e\Lambda X$ scattering. M.Rafat, R.Ramachandran, I.I.T.Kanpur.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.73

Summary form only given. Perturbative ACD is used to predict the polarization of Λ produced in electron scattering from polarized proton. The asymmetry in valence and sea polarization inside polarized proton is estimated from constraints resulting from Altarelli-Parisi equations. Quark fragmentation into Λ is extracted from e^+e^- data. The authors' results indicate a definite and substantial correlation in proton and Λ polarizations.

74778 Lepton-hadron inclusive scattering and QCD. J.Steinberger (CERN, Geneva, Switzerland).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.781-807

One of the most important developments in physics in the last decade is the evolution of a serious pretender to theory of strong interactions, Quantum Chromodynamics (QCD). In principle, the theory encompasses all strong interaction phenomena, however, at present, quantitative predictions are possible only for a limited number of experimental domains. The most quantitative predictions of QCD are still those for lepton-hadron inclusive scattering. The status of the comparison of the theory with experiment is reviewed. (17 refs.)

74780 Polarized single pion photoproductions test for various quark models. P.Nath, M.Gupta, M.P.Khanna (Dept. of Phys., Panjab Univ., Chandigarh, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.78

Summary form only given. The multipole analysis of resonance photocouplings of Babcock and Rosner is extended to the case of single-pion photoproduction by polarized photons. The various polarized cross-sections, polarized target asymmetry, polarized photon asymmetry, and recoil nucleon polarization are evaluated. The present analysis is exploited for discriminating different quark models which predict photocouplings of nonstrange baryon resonances. The analysis provides a viable approach for bringing out, in a fairly model independent manner, the finer distinctions of various models some of which incorporate relativistic and chromodynamic effects.

74781 Recent results from PETRA. A.Wagner (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany).

AIP Conf. Proc. (USA), no.98, p.103-25 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

Recent results from PETRA on the measurement of the total hadronic cross section of the strong coupling constant α_s and of the gluon spin are presented. The observation of a 4-jet structure is reported. Measurements of the interference of electromagnetic and weak interactions and of the parameters of the weak neutral current are reviewed. (31 refs.)

74782 Recent results in T spectroscopy from CESR. R.D.Schamberger, Jr. (State Univ. of New York, Stony Brook, NY, USA).

AIP Conf. Proc. (USA), no.98, p.381-401 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

The author presents recent results in T spectroscopy from CESR. Primary emphasis in the past year in the area of spectroscopy has centered on the decay modes of the $T^*(3^3S_1)$. Hadronic transitions to both lower lying S states have been measured. Photon transitions to the 2^3P states have been observed in both inclusive and exclusive channels. Branching ratios and parameters of the 2^3P states will be presented. Limits on other states in the T system, accessible through e^+e^- annihilations, and results on an axion search are also reported. (45 refs.)

74783 The influence of fragmentation models on the determination of the strong coupling constant in e^+e^- annihilation into hadrons. H.J.Behrend, C.Chen, H.Fenner, M.J.Schachter, V.Schroder, H.Sindt (DESY, Hamburg, Germany), G.D'Agostini, W.D.Apel, S.Banerjee, J.Bodenkamp, D.Chrobaczek, J.Engler, G.Flugge, D.C.Fries, W.Fues, K.Gamerding, G.Hopp, H.Kuster, H.Muller, H.Randoll, G.Schmidt, H.Schneider, W.De Boer, G.Buschhorn, G.Grindhammer, P.Grosse-Wiesmann, B.Gunderson, C.Kiesling, R.Kotthaus, U.Kruse, H.Lierl, D.Luers, H.Oberlack, P.Schacht, P.Colas, A.Cordier, M.Davies, D.Fournier, J.F.Grivaz, J.Haissinski, V.Journe, A.Klarsfeld, F.Laplanche, F.Le Diberder, U.Mallik, J.J.Viellet, J.H.Field, R.George, M.Goldberg, B.Grossetete, O.Hamon, F.Kapusta, F.Kovacs, G.London, L.Poggioli, M.Rivoal, R.Aleksan, J.Bouchez, G.Carnesecchi, G.Cozzika, Y.Ducros, A.Gaidot, S.Jadach, Y.Lavagne, J.Pamela, J.P.Pansart, F.Pierre. Nucl. Phys. B, Part. Phys. (Netherlands), vol.B218, no.2, p.269-88 (6 June 1983).

Hadronic events obtained with the CELLO detector at PETRA were compared with first-order QCD predictions using two different models for the fragmentation of quarks and gluons, the Hoyer model and the Lund model. Both models are in reasonable agreement with the data, although they do not completely reproduce the details of many distributions. Several methods have been applied to determine the strong coupling constant α_s . Although within one model the value of α_s varies by 20% among the different methods, the values determined using the Lund model are 30% or more larger (depending on the method used) than the values determined with the Hoyer model. (21 refs.)

74784 Hadronic final states in e^+e^- annihilation. Recent results from TASSO. J.Proudfoot.

Report RL-83-031, Rutherford Appleton Lab., Chilton, Oxon., England (April 1983), 28 pp.

Measurements of charged and neutral hadron production in e^+e^- annihilation are presented. Some comparisons with theoretical predictions are given. (25 refs.)

74785 The hydrodynamic model description of e^+e^- hadrons and the contribution of the simple wave regions. A.Biswas, T.De (Saha Inst. of Nuclear Phys., Calcutta, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.60

Summary form only given. In the light of recent interest in and the success of hydro-dynamic model (Banerjee et al., 1981) in explaining the various features of hadronic e^+e^- annihilation, the contribution of the 'simple wave' regions which have been neglected in the previous works have been reanalysed. In the present work the authors have studied the number of particles and the amount of energy carried away by the 'simple wave' parts of the hadronic fireball system. They have also pointed out some errors in the earlier estimates. Their investigations show that the fraction of particle number contained in these regions is approximately 15-20% at the available range of c.m. energies in colliding beam machines. (2 refs.)

74786 Analysis of the energy weighted angular correlations in hadronic annihilations at 22 and 34 GeV.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.130

Measurements of energy weighted angular correlations in electron positron annihilations at cm energies of 22 GeV and 34 GeV are presented. The data are compared with perturbative QCD predictions. The theoretical predictions which refer to the partons describe the data reasonably well, depending on the approximations chosen. The effective strong coupling constant, α_s , has been determined with a method which is expected to be insensitive to fragmentation effects. Nonetheless, the values obtained shows a strong variation depending on the fragmentation model assumed. At large acollinearity angles QCD calculations going beyond the Leading Double Log approximation appear to be quite successful in describing the data. The agreement is improved when the smearing effect of heavy resonance decay is taken into account.

74787 Electroweak effects in e^+e^- annihilations. B.Naroska (DESY, Hamburg, Germany).

Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.213-31

The author reports on the evidence of electroweak interference effects in e^+e^- interactions. Data come mainly from 4 experiments at PETRA, namely CELLO, JADE, MARK J, and TASSO. (17 refs.)

74788 Jets at Petra. H.Oberlack (Max-Planck-Inst. fur Phys. & Astrophys., Werner-Heisenberg-Inst. fur Phys., München, Germany).

Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.233-72

The hadronic final state of e^+e^- reactions has provided a fruitful testing ground for QCD predictions, on quark pair production and colour radiative processes. In particular, the study of the topology of this final state in terms of jet production and their properties now leads to a certain amount of commonly accepted facts: quarks have spin 1/2, are pointlike down to distances of 10^{-16} cm, and are produced in oppositely charged pairs; coloured gluons are needed to reproduce the observed features of the data, are vector particles, and are produced according to a Bremsstrahlung spectrum. With increased statistics and improved experimental techniques, more refined studies are under way; and more and more detailed results become available. The author reviews result of analyses on parton formation and fragmentation in multi-hadronic final states which have become available very recently, from the five detectors at PETRA. (46 refs.)

74789 Recent results from the MAC and MARK II detectors at PEP. J.Dorfan (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).

Physics in Collision. High-Energy ee/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.273-302

All the PEP data presented were taken at $E_{cm} = 29$ GeV. Topics covered are the total hadronic cross section, inclusive momentum distributions, energy-energy correlations and thereby a measure of α_s , the observation of D^* 's and a measurement of the charm fragmentation function, τ charged particle branching fractions, measurement of the τ lifetime and a search for charged, spin 0 scalars. (32 refs.)

74790 Some recent results in e^+e^- physics in the US. C.W.Peck (California Inst. of Technol., Pasadena, CA, USA).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.809-38

Discusses several important results that have been reported from CESR and SPEAR. The author reports the recent results from Cornell on $b\bar{b}$ spectroscopy, those from SPEAR on $\bar{c}c$ spectroscopy, and only one new result from the Crystal Ball relating to charmed mesons. (30 refs.)

74791 A study of e^+e^- annihilation into hadrons in the 1400-2200 MeV energy range with the magnetic detector DM1 at DCI: observation and study of a ϕ' vector meson. J.Perez-y-Jorba (Lab. de l'Accelérateur Lineaire, Orsay, France).

The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.839-71

The e^+e^- annihilation into hadrons has been studied for $1.4 < \sqrt{s} < 2.2$ GeV. The total integrated luminosity was 1500 nb^{-1} over the whole energy range. Accurate magnetic analysis of charged particle momenta allowed a constrained kinematical reconstruction of events with at most one neutral missing. Cross-sections are given for production of the following exclusive channels: $\pi^+\pi^+\pi^-\pi^-$ (including $\rho^0\pi^+\pi^-$), $\pi^+\pi^-\pi^+\pi^-\pi^0$ (including $\omega\pi^+\pi^-$), $K^+K^-, K_S^0K_L^0, K_S^0K^+\pi^-, K_S^0K^-\pi^+$ (including K^*K), $K^+K^-\pi^+\pi^-$ (including $K^*K\pi$). The only inclusive result concerns the production of K_S^0 . The $\rho'(1.55)$ is observed in the $4\pi^0$ channel with high statistics. A small bump in the $\omega\pi^+\pi^-$ channel is observed near 1.65 GeV with a height 6.7 standard deviation above background. The rather high cross-section $KK\pi$ production in the same region and the dynamics of this channel, exhibiting an $I=0, I=1$ interference, show that this bump is due to a new ϕ' vector meson rather than to an ω' . This new ϕ' (1.65 GeV) has a 150 MeV width and decays mainly in KK^* . (19 refs.)

| 74792 The free NN interaction, 50-1000 MeV. D.V.Bugg (Queen Mary Coll., London, England). AIP Conf. Proc. (USA), no.97, p.1-19 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Phase shift solutions for pp elastic scattering are unique up to 800 MeV, and for np up to 500 MeV. There is excellent agreement between three analyses for all phase shifts δ and for elasticity parameters η of dominant inelastic partial waves (1D_2 , 3F_3 and 3P_2). For low partial waves, notably 3P_0 , 3P_1 and 3S_0 , there are some disagreements about η parameters, reflecting insensitivity of elastic data and some discrepancies amongst experiments. The need for further data is reviewed. Amplitudes for np—pn between 140 and 500 MeV are known accurately from phase shift analysis, and are almost purely real; they are useful for extracting nuclear matrix elements from (p,n) reactions. The Paris potential is the best potential model fit to data up to 425 MeV, but there are some small systematic discrepancies with data. (44 refs.) | |
| 74793 Energy dependence of spin-spin correlation parameters in large-angle pp-scattering. S.M.Troshin, N.E.Tyurin (Inst. for High Energy Phys., Moscow, USSR). Hadronic J. (USA), vol.6, no.2, p.259-77 (March 1983). A three-dimensional dynamic equation in quantum field theory for the scattering amplitude is used to analyse large-angle pp scattering with account for all spin components. The expressions are obtained for the spin-spin correlation parameters $A_{nn}(\pi/2)$ and $A_{ll}(\pi/2)$ which reveal oscillations with s. Such a behaviour allows one to understand the experimental results obtained at ZGS energies. The asymptotic values of the parameters $A_{nn}(\pi/2)$ and $A_{ll}(\pi/2)$ appear to be 1/3 and -1/3, respectively. (10 refs.) | |
| 74794 Charge asymmetry in the emission of direct electrons in pp interactions at 2.0 GeV/c. S.Banerjee, S.N.Ganguli, A.Gurtu, P.K.Malhotra, R.Raghavan, A.Subramanian, K.Sudhaker (Tata Inst. of Fundamental Res., Bombay, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.132 A certain amount of charge asymmetry in the number of identified electrons and positrons seen to emerge from the reaction vertices of pp at 2.0 GeV/c in a hydrogen bubble chamber is reported. This charge asymmetry cannot be ascribed to any instrumental effect or the electromagnetic decays of known mesons. | |

| 74795 Optimised polynomial expansion and phase shift analysis of Λ -p scattering. S.Mohanty (Dept. of Phys., Utkal Univ., Bhubaneswar, India), J.K.Mohapatra. Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.71 Summary form only given. The analytic cut t-plane of the helicity amplitudes of Λ -p scattering is mapped into the interior of an ellipse. The helicity amplitudes are then expressed as optimised polynomial expansions (OPE) in the mapped variable with the aim to exploit the capacity of OPE to store information. A fixed energy phase shift analysis is then performed using a few phase shifts and coupling constants as inputs to determine the parameters of the suitably truncated expansion. The parameters of the helicity amplitudes for higher j values, excited at that energy, are then reliably predicted, exhibiting a definite economy in the number of free parameters used by earlier workers for such phase shift analysis of Λ -p scattering. | |

| 74796 Evidence for glueballs. S.J.Lindenbaum (Brookhaven Nat. Lab., Upton, NY, USA). AIP Conf. Proc. (USA), no.98, p.218-46 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982). This paper describes the observation and partial wave analysis of 1203 (22 GeV) $\pi^-p \rightarrow \phi\phi n$ events. This is an OZI suppressed channel in which the OZI suppression is found to be absent. Assuming QCD and the OZI rule as Ansatz, it is concluded that the breakdown of the OZI suppression is due to glueballs. The $g_{\pi}(2160)$ and the $g_{\pi}(2320)$ with $I^0J^{PC}=0^{++}2^{++}$ are two resonances determined from the partial wave analysis. It is concluded that one or two primary glueballs with the above quantum numbers are responsible for the observed two states. A brief discussion of other glueball candidates and some relevant phenomenology is also included. (34 refs.) | |
| 74797 Spin-rotation measurements in $\pi p \rightarrow K^0\Lambda$. K.W.Bell, J.A.Blissett, T.A.Broome, H.M.Daley, J.C.Hart, A.L.Lintern, R.Maybury, A.G.Parham, B.T.Payne, D.H.Saxon, T.G.Walker, J.B.Whittaker. Report RL-83-005, Rutherford Appleton Lab., Chilton, Oxon., England (March 1983), 39 pp. The first measurements of spin-rotation in meson-baryon scattering in the resonance region are presented. These measurements, for the reaction $\pi^-p \rightarrow K^0\Lambda$, confirm the main predictions of a previous partial-wave analysis. Comments are made on resonant couplings in the reaction $\pi^-p \rightarrow K^0\Lambda$. (26 refs.) | |

| 74798 Kp and πp scattering in near forward directions. C.Savitri, P.K.Patnaik (Dept. of Phys., Sambalpur Univ., Sambalpur, India), R.C.Badatya. Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.68 Summary form only given. An analytic parametrisation procedure earlier applied to pp scattering is applied to Kp and πp scattering. In contrast to the pp case the procedure here is valid for non-forward directions also. Within the scope of P+f model and pomeron is assumed to be built out of s-channel branch cuts. The branch cuts are parametrised through conformal mapping and polynomial expansion methods. Theorems on high energy bounds are used to obtain the final result. The result is compared with experiment. | |

| 74799 Growth of $\langle p_{\perp} \rangle$ with multiplicity at the collider energy and a two-component model for pp collision. H.Banerjee, T.De, D.Syam (Saha Inst. of Nuclear Phys., Calcutta, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.59 Summary form only given. The recent observation (G. Arison et al., 1982) at the pp collider of the growth of $\langle p_{\perp} \rangle$ per particle with the multiplicity of secondaries in each event admits of a simple interpretation in the two-component model proposed by the authors (1982). According to this model events with large multiplicity correspond to the situation where more energy is pumped into the central fireball and less to the leading cluster. The $\langle p_{\perp} \rangle$ of secondaries emanating from the central fireball, which hadronizes hydrodynamically, grows with the energy of the fireball. The growth of multiplicity of secondaries from the central fireball has the typical power dependence $(W^{1/2})$ on the energy content of the fireball. Thus in this model there is direct correlation of the multiplicity of an event with $\langle p_{\perp} \rangle$ per particle. (2 refs.) | |

The results are compared with those obtained by other methods. | |
| 74802 Hard scattering at ISR energies. N.A.McCubbin (Rutherford Appleton Lab., Chilton, Didcot, England). Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.1-20 After giving a brief summary of the situation in hard scattering in hadron-hadron collisions, the author discusses in more detail some of the recent results from: di-lepton production (Drell-Yan); single photon production; experiments using a high p_T single particle trigger; experiments using a calorimeter trigger. (14 refs.) | |

74803 Proton-antiproton elastic scattering and total cross section at the CERN collider. B.Koene (NIKHEF-H, Amsterdam, Netherlands). Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.85-97. Measurements of elastic scattering at low momentum transfer and of the total cross section were performed during the first physics run of the CERN proton-antiproton Collider at $\sqrt{s}=540$ GeV. Data were taken during about 15 h of running time with an antiproton bunch of $\sim 4 \times 10^9$ particles colliding against a proton bunch of $\sim 5 \times 10^{10}$ particles. The machine optics in the intersection region was the same as for normal SPS operation. The nominal luminosity was of the order of $10^{26} \text{ cm}^{-2} \text{ s}^{-1}$. (14 refs.)

74805 Recent study of jets at the ISR. A.M.Segar (Dept. of Nuclear Phys., Univ. of Oxford, Oxford, England). *AIP Conf. Proc. (USA)*, no.98, p.274-92 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

A review of results on jets is presented, with emphasis on recent data which are tending to support the interpretation of high transverse momentum phenomena in QCD. Calorimeter trigger results which show two-jet structure at high $E_T \geq 20$ GeV are presented. (13 refs.)

74806 Antiproton-proton total and elastic cross-sections at the CERN ISR and the SPS collider. D.L.Owen (CERN, Geneva, Switzerland). *AIP Conf. Proc. (USA)*, no.98, p.293-311 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

Three experiments, currently running at CERN, are devoted to the measurement of total and elastic cross-sections in antiproton-proton collisions: experiments R210 and R211 at the ISR, and Experiment UA4 at the SPS Collider. The various experimental techniques and setups are briefly described, and the most recent results obtained are reported. The combined centre-of-mass energy range of the three experiments is $31 < \sqrt{s} < 540$ GeV. In this range the p_{\perp} total cross-section is found to rise approximately like $(\ln s)^2$, as does the pp total cross-section, and the difference, $\sigma_{\text{tot}}(pp) - \sigma_{\text{tot}}(p\bar{p})$, tends to zero as $s^{-1/2}$, with $\alpha \approx 1/2$. (no refs.)

74807 Rapidity distribution of shower particles in proton-nucleus interactions in emulsions at 70 GeV. G.C.Ghosh, B.K.Bandyopadhyay (Dept. of Phys., Presidency Coll., Calcutta, India). *Can. J. Phys. (Canada)*, vol.61, no.5, p.753-7 (May 1983).

Nuclear emulsion plates exposed to 70 GeV protons have been scanned for inelastic interactions. The rapidity distribution of the shower particles observed in 132 events are presented. The dependence of rapidity on the target nucleus mass number has been studied and compared with the results for other energies obtained by earlier workers. The individual rapidity of the shower particles observed in some high multiplicity events are also shown. The qualitative features of the observed rapidity distributions agree with the Glauber-Gribov multiperipheral model (1970). (14 refs.)

74808 New unitarity bounds and their near-saturation by ISR data. P.Valin (Dept. of Phys., McGill Univ., Montreal, Canada). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B218, no.1, p.215-39 (30 May 1983).

A new set of unitarity bounds supplemented by experimentally measured quantities is derived and tested against a recent compilation of ISR data to check the latter's internal consistency. These bounds are obtained by supplying one value of the absorptive elastic amplitude at a fixed non-zero t value. The general numerical technique is explicitly given in a simple form and some typical analytic results are displayed. The author also discusses as special cases some previously obtained bounds and points out the added usefulness of the newly derived bounds for experimentalists and their near-saturation by the existing data over an extended t interval. Applications include the relative normalization of different sets of data and tests for dubious data points; finally suggestions are made for pp collider measurement. (34 refs.)

74809 Observation of two-proton correlations in pNe interactions at 300 GeV/c. S.A.Azimov, M.L.Allaberdin, S.O.Edgorgov, Sh.V.Inogamov, E.A.Kosonovskii, V.D.Lipin, S.L.Lutpullaev, K.Olimov, Kh.A.Rizaev, T.P.Tarasova, K.T.Turdaliev, A.A.Yuldashev, B.S.Yuldashev (Physicotech. Inst., Acad. of Sci., Uzbek SSR). *JETP Lett. (USA)*, vol.36, no.9, p.428-31 (5 Nov. 1982). Translation of: *Pisma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.349-52 (5 Nov. 1982). [received: June 1983]

Experimental data reveal a correlation between protons with approximately equal momenta in the reactions $p\text{Ne} \rightarrow mp + X$, $m \geq 2$, at a primary momentum $p_0 = 300$ GeV/c. The correlation becomes closer as the momenta of the secondary protons increase. (9 refs.)

74810 Evidence for 'held-back' valence quarks from particle ratios in pp and pp collisions. A.Capella, Tran Thanh Van (Lab. de Phys. Theorique et Hautes Energies, Univ. de Paris XI, Orsay, France), U.P.Sukhatme. *Phys. Lett. B (Netherlands)*, vol.125B, no.4, p.330-4 (2 June 1983).

The authors show that recently measured particle ratios in the central region of pp and pp collisions give valuable information on the fate of valence quarks in a soft hadronic collision, indicating that the valence quark from each initial hadron is 'held back' with a small momentum fraction. This mechanism is a key feature of the dual parton fragmentation approach to low- p_T multiparticle production. (17 refs.)

74811 Evidence for the t-quark in pp collider data? V.Barger, A.D.Martin (Dept. of Phys., Univ. of Durham, Durham, England), R.J.N.Phillips. *Phys. Lett. B (Netherlands)*, vol.125B, no.4, p.339-42 (2 June 1983).

The authors propose a simple method to identify semileptonic weak decays $t \rightarrow b + \nu$ of any heavy particle t and to determine its mass independent of the production mechanism, using pp collider events that contain a single electron (or muon) and missing transverse momentum. Events with transverse mass $M_T(\nu) > 3$ GeV originate either from t-decays of mass $m_t > M_T(\nu) + m_b$, or from $W \rightarrow e \nu$ decays; the latter is a distinctive background that can be subtracted. The $M_T(\nu)$ distribution of electron events with jets recently observed in the UA1 experiment at CERN may be interpreted as being due to a t-quark with mass 25 to 40 GeV. (8 refs.)

74812 On the description of multiplicity distributions in multiple production processes in terms of combinatorics. J.Bartke (High Energy Lab., Joint Inst. for Nuclear Res., Moscow, USSR). *Phys. Scr. (Sweden)*, vol.27, no.4, p.225-7 (April 1983).

A new method of analysis of multiplicity distributions of secondary particles in multiple production processes is discussed and applied to high-energy proton-proton and nucleus-nucleus collisions. (26 refs.)

74813 $\phi\phi$ production in high-energy hadron-hadron collisions and enhancement near threshold. S.P.Misra (Inst. of Phys., Bhubaneswar, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.58.

Summary form only given. Excessive $\phi\phi$ production has been seen in $\pi p \rightarrow \phi\phi x$ and $pp \rightarrow \phi\phi x$ with an enhancement near $\phi\phi$ threshold. The author interprets this as a direct evidence of gluon-gluon collisions and suggests that similar other reactions parallel to photon-photon collisions may be looked for. The phenomena observed again appear to indicate a subtle dynamical enhancement of some cross sections near threshold as a result of composite substructure.

74814 Study of inclusive γ -production in pp interactions at 12 GeV/c. S.Banerjee, S.Chakrabarti, S.N.Ganguli, A.Gurtu, P.K.Mahotra, R.Raghavan, A.Subramanian, K.Sudhakar (Tata Inst. of Fundamental Res., Bombay, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.131.

The authors present a study of inclusive γ -production in pp interactions at 12 GeV/c. The data are obtained from the analysis of pictures taken in the BEBC at CERN. The inclusive γ cross-section and the average number of γ as a function of charged multiplicity are presented. Multiparticle correlation parameters are discussed and the 2γ mass distribution has been studied to obtain π^0 inclusive cross-section. x and p_T distributions of the γ s are compared with the distributions obtained from π^\pm assuming charge symmetry. The results have been compared with other inclusive γ studies.

74815 Analysis of inclusive particle ratios in π^-p interactions at 40 GeV/c. J.B.Singh (Dept. of Phys., Panjab Univ., Chandigarh, India). Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.123.

The results of inclusive study of particle production ratios in π^-p interactions at 40 GeV/c have been presented. The ratios π^+/π^- , π^0/π^- , π^-/π^- and π^-/π^+ as a function of the Feynman variable in the proton fragmentation region have been studied. The results obtained have been discussed in view of QCD theoretical models viz: quark-exchange, gluon-exchange, etc.

74816 Comparison of pp/pp interactions. M.Jacob (CERN, Geneva, Switzerland). Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.21-41.

The use of the SPS as a pp collider is the driving force of the extensive pp programme at CERN. However, it was realized that, at a relatively low extra cost, one could also use the PS to inject the accumulated antiprotons either into a low-energy ring LEAR or into the ISR, even if injection and acceleration into the SPS remains the major part of the programme. The purpose of this note is to review the ISR part of the pp programme, presenting the physics results obtained so far. (22 refs.)

74817 First results of the UA1 experiment. M.Pimia (Helsinki Univ., Helsinki, Finland). Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.43-66.

First results of the CERN SPS proton-antiproton collider which has short machine development and physics runs during autumn 1981 are described. (17 refs.)

74818 Status and first results from the UA2 experiment. P.Jenni (CERN, Geneva, Switzerland). Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.67-83.

The UA2 detector was recently installed at the CERN Super Proton Synchrotron (SPS) pp Collider. The successful operation of the SPS pp Collider² allows the study of hadron interactions at a center of mass energy $\sqrt{s}=540$ GeV, one order of magnitude higher than previously available. The data

presented here were recorded with the UA2 detector during the first pp period in November-December 1981. (14 refs.)

74819 Results from the UA5 experiment. D.R.Ward (Cavendish Lab., Univ. of Cambridge, Cambridge, England). Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.99-121. Presents a review of the results obtained using the UA5 streamer chamber detector in the early months since the successful operation of the CERN SPS pp collider at $\sqrt{s}=540$ GeV. The primary objective of the UA5 experiment was to carry out a rapid survey of hadronic interactions in this new energy regime. (21 refs.)

74820 Theoretical implications on ISABELLE physics. Ling-Lie Chau (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA). The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.447-93. Discusses theoretical work on unification, grand unification, quark models and intermediate bosons which lead to experimental work with pp and pp at ISABELLE. (48 refs.)

74821 Multiparticle hadronic systems produced in high-energy (pp) interactions, and comparison with (e^+e^-). M.Basile, C.Cara Romeo, L.Cifarelli, A.Contin, G.D'Alì, B.Esposito, P.Giusti, T.Massam, R.Nania, F.Palmonari, G.Sartorelli, G.Valenti, A.Zichichi (CERN, Geneva, Switzerland). The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.495-507. Reports on a series of similarities between multiparticle hadronic systems produced in (pp) interactions and in (e^+e^-) annihilation. The new feature of this work is the fact that, in order to establish these similarities, the basic principle is to evaluate, for each (pp) interaction, the correct energy available for particle production. The old trend was to select high- p_T processes. The comparison of the multiparticle hadronic systems produced in (pp) interactions and (e^+e^-) annihilation is discussed in terms of the following five quantities: (i) the inclusive, single-particle, fractional momentum distribution of the produced particles; (ii) the inclusive transverse momentum distribution of the particles produced; (iii) the average charged particle multiplicity; (iv) the ratio of 'charged' to 'total' energy of the multiparticle hadronic systems produced; (v) the planarity of the multiparticle hadronic systems produced. (17 refs.)

74822 Status of charmed particles. F.Muller (CERN, Geneva, Switzerland). The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.627-76. Summarizes the properties of known charmed particles (D , F and Λ_c) and then deal with production processes, mainly in hadronic interactions. (88 refs.)

13.85M Cosmic ray interactions
(see also 94.40 Cosmic rays)

74823 High-energy hadrons produced by cosmic-ray muons in the earth as a source of background in proton-decay experiments. A.S.Mal'gin, O.G.Ryazhskaya, V.G.Ryasnyi, F.F.Khal'chukov (Inst. of Nuclear Res., Acad. of Sci., USSR). JETP Lett. (USA), vol.36, no.8, p.376-9 (20 Oct. 1982). Translation of: Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR), vol.36, no.8, p.308-10 (20 Oct. 1982). [received: June 1983] The flux density of neutrons with energies of 20-80 MeV produced by muons underground at a depth of 550 meters water-equivalent has been measured. The flux density of hadrons with energies above 0.7 GeV is estimated for various depths. The hadron background is important in experiments on the decay of the proton at depths down to 8000 meters water equivalent. (14 refs.)

74824 Event structure in collider and cosmic ray experiments. N.Yam-dagni (Inst. of Phys., Univ. of Stockholm, Stockholm, Sweden). Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.327-41. The author compares some of the new collider results with the cosmic ray results from emulsion chamber experiments. The emulsion chamber data comes from three large emulsion chamber experiments. This data can be divided into two parts. The first part is one in which the incoming particle interacts in the target layer of a two-storeyed emulsion chamber (these events are called C-jets, as the target layer consists mainly of carbon). They are observed by the Brazil-Japan collaboration. The second part of the data consists of interactions taking place in air above the emulsion chamber (~1 km). These events are observed by all emulsion chamber experiments. (9 refs.)

13.88 POLARISATION IN INTERACTIONS AND SCATTERING

74825 Prospects for polarized electrons at high energies. C.Y.Prescott (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA). The High-Energy Limit. Proceedings of the Eighteenth Course of the International School of Subnuclear Physics, Erice, Italy, 31 July-11 Aug. 1980 (New York, USA: Plenum 1983), p.415-46. Neutral current and electroweak processes at high energies are well known to have large spin-dependent components. Proven techniques for producing polarized beams at storage rings and linear accelerators are now available. It is argued that use of polarized electrons in e^+e^- annihilation at the Z^0 pole and above will provide the most precise tests of, and best experimental challenge to, the standard $SU(2)\times U(1)$ gauge theory model of electroweak interactions. (22 refs.)

13.90 OTHER TOPICS IN SPECIFIC REACTIONS AND PHENOMENOLOGY OF ELEMENTARY PARTICLES

74826 Two-photon physics. R.O.Polvado (Univ. of Maryland, College Park, MD, USA). AIP Conf. Proc. (USA), no.98, p.176-98 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).

A brief overview of $\gamma\gamma$ physics is presented. Two-body final states are considered and a preliminary result on non-resonant $\gamma\gamma\rightarrow h^+h^-$ ($h=\pi,K,p$) is given. The most recent results on the η' , ρ^0 , A_2 , and f' resonances are tabulated and the status of $\gamma\gamma\rightarrow\rho^0\rho^0$ is discussed. The measurements of F_2 and high P_T jets are summarized. (44 refs.)

74827 Energy loss by slow magnetic monopoles. J.Gea-Banacloche, K.Cahill, D.Rossbach (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA), A.Comtet.

Let. Nuovo Cimento (Italy), vol.37, ser.2, no.4, p.145-8 (28 May 1983). Two approximate classical calculations of energy loss by very slow magnetic monopoles are described. It is shown that the energy loss per unit length to bound electrons varies as the square of the velocity of the monopole, while that to conduction electrons varies linearly. (6 refs.)

74828 Finding the t-quark in W boson decay debris. V.Barger, A.D.Martin (Dept. of Phys., Univ. of Durham, Durham, England), R.J.N.Phillips.

Phys. Lett. B (Netherlands), vol.125B, no.4, p.343-6 (2 June 1983). The authors point out a spectacular jet plus electron signature of t-quark production at pp colliders via W boson decay $W\rightarrow tb$ with subsequent $b\rightarrow jet$, and $t\rightarrow be\nu$ decays. The b jet momentum transverse to the beam has a jacobian peak near $p_T(b)=(M_W^2-m_t^2)/2M_W$; this jet is expected to be highly collimated. Electrons from t-decay occur with large momentum components normal to the b jet in the plane transverse to the beam. Both the b jacobian peak and transverse momenta of the t-decay fragments can be used in making further determinations of m_t . (7 refs.)

74829 A review of two-photon physics. S.Cooper (DESY, Hamburg, Germany).

Physics in Collision. High-Energy ee/ep/pp Interactions. Proceedings of an International Conference, Stockholm, Sweden, 2-4 June 1982 (New York, USA: Plenum 1983), p.123-48

This talk is intended as an introduction for those not yet expert in two-photon physics, especially those e^+e^- one-photon physicists who still think of two-photon events as background. The author concentrates on the physics questions involved, especially emphasizing the areas where she feels progress can be made in the near future. After a quick survey of the field and a few words about kinematics, she discusses in detail two major fields: the photon structure function and resonance production. (48 refs.)

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

- 74831 Evidence concerning Δ -hole states. J.Rapaport (Ohio Univ., Athens, OH, USA). *AIP Conf. Proc. (USA)*, no.97, p.365-77 (1982). [received: May 1983]
 (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
 Recent (p,n) experiments at intermediate energy at the Indiana University Cyclotron have been used to study the spin-isospin transfer response function of nuclei. In particular forward angle spectra are dominated by neutron peaks characterized with $\Delta L=0$ transfer, which have been identified as Gamow-Teller (GT) 1^+ states. The GT strength function in nuclei throughout the periodic table is presented. The sum of the total observed GT strength is compared to a model independent sum rule to obtain an A dependence of the quenching. General features of GT strength distributions are presented and discussed. A special effort is made to estimate how much of the GT strength resides at excitation energies between 20-40 MeV. The fact that less GT strength is observed than is expected may be associated with intrinsic nucleon degrees of freedom, in particular the excitation of Δ -hole states. (14 refs.)
 74832 Low lying yrast states of ^{32}S . R.M.Freeman, F.Haas, C.Beck, A.Niemeskern (Univ. Louis Pasteur, Strasbourg, France). *J. Phys. Lett. (France)*, vol.44, no.11, p.429-32 (1 June 1983).
 From angular correlation measurements with the $^{28}\text{Si}(\alpha, n\gamma)^{32}\text{S}$ reaction the 6762-keV level has been assigned $J^\pi=5^-$. Four new levels of ^{32}S have been observed at $E_x=7567$ -, 8345-, 9464 and 9637-keV. The 7567-keV level has been assigned $J^\pi=5^+$ and the 8345-keV level is a good candidate for the lowest 6^+ state. The two higher levels are probably negative parity high spin states. (3 refs.)
 74833 Level structure of the $N=88$ isotones ^{149}Pm , ^{151}Eu and ^{153}Tb . R.K.Guchhait (Dept. of Phys., Gurudas Coll., Calcutta, India), S.Bhattacharya, S.Sen. *J. Phys. G (GB)*, vol.9, no.6, p.631-42 (June 1983).
 The level structures of the $N=88$ isotones ^{149}Pm , ^{151}Eu and ^{153}Tb are studied in a version of the unified vibrational model which incorporates both pairing effects and anharmonicity in the core vibrations. The proton quasiparticle states in the $Z=50-82$ shell are coupled to anharmonic vibrations of the corresponding even cores. The calculated level energies, spectroscopic factor and E2 transition strengths are compared with available experimental data and predictions of other theoretical calculations. (40 refs.)

74834 High-spin states in ^{92}Tc . C.A.Fields, F.W.N.de Boer, B.J.Diana (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).

Nucl. Phys. A (Netherlands), vol.A401, no.1, p.117-23 (30 May 1983). High-spin states in ^{92}Tc have been studied using the 33 MeV $^{90}\text{Mo}(^3\text{He},p2n)^{92}\text{Tc}$ reaction. Levels up to $J=(13)$ are identified. The results are compared with various shell-model calculations. (9 refs.)

74835 Nuclear polarization and sign of the quadrupole moment of the $^{54}\text{Fe}(10^+)$ isomer. E.Davni, M.Hass, H.H.Bertschat, C.Broude, F.Davidovsky, G.Goldring, P.M.S.Lesser (Dept. of Nuclear Phys., Weizmann Inst. of Sci., Rehovot, Israel).

Phys. Rev. Lett. (USA), vol.50, no.21, p.1652-5 (23 May 1983). A novel approach to the determination of signs of quadrupole deformations of high-spin isomers is presented. Recoiling $^{54}\text{Fe}(10^+)$ isomers, populated by the reaction $^{45}\text{Sc}(^{12}\text{C}, p2n)$ are polarized by passage through an array of tilted carbon foils and stop in a Cd single crystal. The observation of a quadrupole precession serves to measure both the induced nuclear polarization and the sign of the quadrupole moment. A positive sign of $Q(^{54}\text{Fe}(10^+))$ has been deduced. (20 refs.)

74836 The $N=82$ isotones in the generalized seniority scheme. O.Scholten, H.Kruse (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.113-15 (26 May 1983). A calculation for the $N=82$ isotones in the generalized seniority scheme is presented and compared with a shell model calculation. (9 refs.)

74837 Triaxial shapes of rotating nuclei with neutron numbers 88, 89, 90.

S.Frauentorf (Univ. of Tennessee, Knoxville, TN, USA), F.R.May, *Phys. Lett. B (Netherlands)*, vol.125B, no.4, p.245-50 (2 June 1983).

The tendency of high- j quasiparticles to drive rotating nuclei towards triaxial shapes is studied by means of the cranked shell model. Depending on the position of the chemical potential within the j -shell different γ -values are preferred by the quasiparticles, which may induce significant configuration dependent γ -deformations in γ -soft nuclei. As an example the rotational spectra of $Z=66, 67, N=88, 89, 90$ nuclides are studied. Equilibrium γ -values are found by minimizing the sum of phenomenological expressions for the ground state deformation- and rotational energies and the quasiparticle energies. The competition between $\nu_{1/2}$ (driving to $\gamma=0$) and $h_{11/2}$ (driving to $\gamma<0$) quasiparticles causes a γ -flip-flop between the configurations observed as changes of the signature splitting and E2-transition probabilities, which may be related to the prolate-oblate difference of the deformation energy. (21 refs.)

74838 Low-spin states in even Po and Rn isotopes and the interplay between collective and quasiparticle configurations. A.Zemel (Kernfysisch Versneller Inst., Rijksuniv. Groningen, Groningen, Netherlands), J.Dobes.

Phys. Rev. C (USA), vol.27, no.5, p.2311-16 (May 1983). Low-spin states in even Po and Rn isotopes are studied within the framework of the interacting-boson-approximation+two-quasiparticle model. The irregular behavior of the 4^+ levels is shown to result from an interplay between collective, quasiparticle, and quasineutron states. Some predictions are made for the corresponding Ra isotopes. (27 refs.)

74839 One- and three-quasiparticle states in $^{127,129,131,133}\text{Xe}$ and their coexistence with band structures. T.Lonnroth, J.Kumpulainen, C.Tuokko (Dept. of Phys., Univ. of Jyväskylä, Jyväskylä, Finland).

Phys. Scr. (Sweden), vol.27, no.4, p.228-40 (April 1983). Excited states in the nuclei $^{127,129,131,133}\text{Xe}$ were populated using the reactions $^{127}(p,n)^{127}\text{Xe}$ and $^{126,128,130}\text{Te}(\alpha,n)^{129,131,133}\text{Xe}$ and their de-excitation was studied using conventional γ -ray and conversion electron spectroscopy. A large number of new levels are identified, most of which are assigned a definite spin-parity. Shell-model arguments are used to identify one- and three-quasiparticle states. The competition between vibrational and quasiparticle excitations is studied, and it is found that quasiparticle excitations become yrast with the filling of the $N=82$ neutron shell. Notably, the $\nu_{11/2}$ band is cut by the three-quasi-particle excitations. (21 refs.)

74840 High-spin states in ^{97}Tc . D.Hippe, H.W.Schuh, U.Kaup, K.O.Zell, P.von Brentano (Inst. für Kernphys., Univ. zu Köln, Köln, Germany), D.B.Fossan.

Z. Phys. A (Germany), vol.311, no.4, p.329-37 (1983). The level scheme of ^{97}Tc was studied by gamma ray spectroscopy using the $^{96}\text{Zr}(^3\text{Li}, 3n)^{97}\text{Tc}$ reaction. New levels and spins and parities were established. ^{97}Tc is compared with the neighbouring even-even nucleus and with the results of an IBFM calculation. (30 refs.)

21.10D Binding energy and masses

74841 Effect of the $\Delta(1236)$ isobar on the three-nucleon bound states. Ch.Hajduk, P.U.Sauer, W.Struive (Theoretical Phys., Univ. of Hannover, Hannover, Germany).

AIP Conf. Proc. (USA), no.97, p.404 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).

Two-nucleon potentials are unable to account simultaneously for the binding energy and the EM form factors of the three-nucleon bound states. If the force is allowed to yield explicit Δ -isobar excitation, the two-nucleon interaction gets renormalized and a three-nucleon interaction and EM exchange-

currents (EC) arise, which are calculated. The single- Δ wave-function components are generated nonperturbatively in a coupled-channel approach by π - and p -exchange transition potentials in the isospin-triplet partial waves up to angular momentum $l=2$. In the model, the Δ improves the ^3H binding energy by 0.3 MeV and the ^3He charge form factor for momentum transfers $Q>4\text{ fm}^{-1}$. In order to improve the magnetic form factor, isovector π - and p -exchange mesonic EC between nucleonic configurations are added. (2 refs.)

21.10F Shape, charge, radius and form factors

74842 Inelastic electron scattering to negative parity states of ^{28}Si . S.Yen, R.J.Sobie, T.E.Drake, H.Zarek (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada), C.F.Williamson, S.Kowalski, C.P.Sargent.

Phys. Rev. C (USA), vol.27, no.5, p.1939-56 (May 1983). Negative-parity states of ^{28}Si are studied by high-resolution inelastic electron scattering. The form factors of the 1^- (8.904), 5^- (9.702), 1^- , 2^- (9.929), 3_2^- (10.180), and 4^- $T=1$ (12.664) states are determined for the first time, for momentum transfers between 0.9 and 2.4 fm^{-1} . The 3_1^- (6.879) state is studied by subtracting off the theoretical contribution of the nearby 4^+ (6.889) state. An upper limit for the 5^- $T=1$ (13.248) is established. The 3^- $T=0/6^-$ $T=0$ complex (11.58) remains unresolved. The authors present evidence for oblate-prolate deformation changes in the 3^- $T=0$ states. The experimental data are compared with predictions of the open-shell random phase approximation of Rowe and Wong (1970). In ^{28}Si , the open-shell random phase approximation is demonstrated to be extremely sensitive to the ground state wave function used, and other possible limitations of the open-shell random phase approximation are discussed. 74843 An interacting boson-fermion model calculation for the odd-mass promethium isotopes. O.Scholten, T.Ozzello (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.106-8 (26 May 1983). A calculation in the framework of the interacting boson-fermion model for the excitation energy and spectroscopic factors for the negative parity levels in the odd-mass promethium isotopes is presented. The parameters are compared with those obtained from an earlier calculation of the europium isotopes. (11 refs.)

- 74844 Variations of the gyromagnetic ratios of low-lying states in ^{192}Os .** H.H. Bolotin, I. Morrison, C.G. Ryan (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia), A.E. Stuchbery.
Nucl. Phys. A (Netherlands), vol. A401, no. 1, p.175-88 (30 May 1983).
The gyromagnetic ratios of the 2_1^+ and 4_1^+ states in ^{192}Os were measured relative to that of the 2_1^+ level. The thin foil perturbed γ -ray angular distribution technique was employed utilizing the transient hyperfine magnetic field present at the nuclei of these ions as they swiftly recoiled through a thin, magnetized Co foil. The states of interest were Coulomb excited using a beam of 220 MeV ^{38}Ni ions. The present measurements yielded ratios $g(2_1^+)/g(2_1^+)=0.68\pm 0.08$ and $g(4_1^+)/g(2_1^+)=1.00\pm 0.12$. The sizable disparity in the measured g -factors of the levels of the two low-lying bands is compared with interacting boson approximation model-based calculations, as well as with a Nilsson basis single-particle model description. (28 refs.)
- 74845 The effect of the $\Delta(1236)$ on the g -factor of nucleons.** R.D. Lawson (Argonne Nat. Lab., Argonne, IL, USA).
Phys. Lett. B (Netherlands), vol. 125B, no. 4, p.255-9 (2 June 1983).
The effect on M1 properties of including the Δ -degree of freedom is examined. In first order perturbation theory the main effect of including the Δ is to renormalize the g -factor of the valence nucleons. Formulas for this change are given for a central plus tensor (NN) \leftrightarrow (ND) transition potential. The effect on magnetic moments is small but $B(M1)$ between spin-orbit partners is decreased by 20-30%. Values for orbits near $A=16, 40, 90$ and 208 are given. (14 refs.)
- 74846 Nuclear orientation and NMR/ON of $^{205,207}\text{Po}$.** P. Herzog, H. Walitzki, K. Freitag, H. Hildebrand, K. Schlosser (Inst. für Strahlen- und Kernphys., Univ. Bonn, Bonn, Germany).
Z. Phys. A (Germany), vol. 311, no. 4, p.351-62 (1983).
 $^{205,207}\text{Po}$ have been implanted into cold host matrices of Fe, Ni, Zn and Be using an on-line isotope separator. Nuclear magnetic resonances of oriented ^{207}Po have been observed. The resonance frequencies for zero external field are $\nu_L(^{207}\text{PoFe})=575.08(20)\text{MHz}$, $\nu_L(^{207}\text{PoNi})=160.1(8)\text{MHz}$, $\nu_L(^{205}\text{PoFe})=551.7(8)\text{MHz}$. From the dependence of the resonance frequency on external magnetic field the g -factor of ^{207}Po is derived as $g(^{207}\text{Po})=+0.31(22)$. Using this value the magnetic hyperfine fields of Po in Fe and Ni are obtained as $B_{\text{hf}}(\text{PoFe})=+238(16)\text{T}$, $B_{\text{hf}}(\text{PoNi})=66.3(4.6)\text{T}$. The g -factor of ^{205}Po follows as $g(^{205}\text{Po})=+0.304(22)$. From the temperature dependence of the anisotropies of γ -lines in the decay of $^{205,207}\text{Po}$ the multipole mixing of several transitions is derived. The electric interaction frequencies in the hosts Zn and Be are also measured. (30 refs.)

21.10M Level density and structure

- 74847 Proton occupancies in the even Se ground states via the $(d,^3\text{He})$ reaction.** G. Rotbard, M. Vergnes, J. Verotte, G. Berrier-Ronsin, J. Kalifa, R. Tamisier (Inst. de Phys. Nucleaire, Orsay, France).
Nucl. Phys. A (Netherlands), vol. A401, no. 1, p.41-58 (30 May 1983).
The spectroscopic factors for the levels of $^{73,75,77,79,81}\text{As}$ has been measured in the $\text{Se}(d,^3\text{He})\text{As}$ reactions at 25.2 MeV. The proton occupation numbers deduced for the even Se isotopes show that the striking change in proton configuration, observed for the Fe isotopes between $N\leq 40$ and $N\geq 42$, does persist for the Se isotopes. This change is not reproduced, either by a model calculation using spectral distribution methods or by proton wave functions recently suggested for the Se isotopes to explain the results of the $\text{Se}(d,^3\text{Li})\text{Ge}$ reactions. (26 refs.)
- 74848 ^6Li levels excited by the $^9\text{Be}(p,\alpha)$ reaction at $E_p=30$ and 50 MeV.** T. Delbar, G. Gregoire (Inst. de Phys. Corpusculaire, Louvain-la-Neuve, Belgium), G. Paic.
Phys. Rev. C (USA), vol. 27, no. 5, p.1887-96 (May 1983).
The levels of the ^6Li nucleus were studied via the $^9\text{Be}(p,\alpha)$ reaction at incident proton energies of 30 and 50 MeV. Accurate excitation energies as well as some of the corresponding widths are extracted for the first few levels known. Marked differences with accepted values were found. The existence of higher excited states in the region $E_{\text{exc}}=8-12$ MeV cannot be ruled out. The aim is not study reaction mechanisms leading to ^6Li excited states but rather to establish their excitation energies and widths and to compare them to published values. The importance of understanding the continuum in the particle spectra is stressed as far as it influences the position and width of the excited states. (27 refs.)
- 74849 Low-lying states in ^{109}In populated by the $(^3\text{He},d)$ reaction in ^{108}Cd .** E.M. Takagui, F.C. Sampaio, O. Dietzsch (Inst. de Física, Univ. de São Paulo, São Paulo, Brazil).
Phys. Rev. C (USA), vol. 27, no. 5, p.1993-2002 (May 1983).
Nuclear levels in ^{109}In have been investigated by means of the $^{108}\text{Cd}(^3\text{He},d)^{109}\text{In}$ reaction, at incident energies of 19.5 and 21 MeV, using a magnetic spectrograph. Twenty-six levels, up to 3 MeV excitation, have been observed. The experimental angular distributions have been compared with distorted-wave Born approximation calculations to assign angular momentum transfers and to determine spectroscopic factors. Total spin assignments have tentatively been made with the help of shell-model predictions. The proton configuration for the ground state of ^{108}Cd has been deduced. The results are compared with previous data on ^{109}In and with $(^3\text{He},d)$ studies on other odd-mass indium isotopes. (28 refs.)

21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

- 74850 Coupled channels and quarks in nucleon-nucleon scattering.** E.L. Lomon (MIT, Cambridge, MA, USA).
AIP Conf. Proc. (USA), no. 97, p.78-82 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
In QCD hadron interactions are approximated by asymptotically free quarks at short range, and by exchange and production of confined hadrons at long range. The R-matrix formalism is introduced to match the exterior hadronic description to a complete set of internal q^6 states at an approximate radius expected to be smaller than the equilibrium bag radius. The long range interaction among NN, $N\Delta$, $\Delta\Delta$ and $NN^*(1440)$ channels is consistent with meson exchange potentials and scattering data up to 800 MeV laboratory kinetic energy. This predicts a deuteron with 4.0% D state and 2.3% total isobar component. The first $^3\text{S}_0$ and $^3\text{S}_1$, q^6 states, obtained from the standard MIT bag model parameters, satisfy the R-matrix condition of being at the energies of the $^3\text{S}_0$ and $^3\text{S}_1$ - $^3\text{D}_1$ wave function zeros for a quark boundary radius $R=1.10$ fm. A zero corresponds to a pole in the logarithmic derivative of a partial-wave function, whose residue is determined by the derivative of the q^6 state energy with respect to the boundary radius. (13 refs.)
- 74851 Density-dependent charge asymmetry and the Coulomb energy anomaly.** J.V. Noble (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).
AIP Conf. Proc. (USA), no. 97, p.83-6 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
The 'discrepancy' between measured and calculated isodoublet mass splittings results from an overly optimistic view of the accuracy of present theory. In fact, charge symmetry breaking interactions are both sufficiently large and sufficiently uncertain that the 'best' theoretical estimates of the isodoublet splittings bracket the measured values within a fairly broad uncertainty. (11 refs.)
- 74852 Information from quasi-elastic scattering on the nucleon-nucleon interaction in nuclei.** N.S. Chant (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
AIP Conf. Proc. (USA), no. 97, p.205-23 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
Methods of obtaining information on the nucleon-nucleon interaction in nuclei by means of quasifree knockout reactions are discussed. Examples of off-shell effects are shown and information on the radial region probed is presented. Various possible measurement strategies are considered as well as the effects of spin orbit distortions. (22 refs.)
- 74853 Implication of the nonlocality in the effective N-N interaction: nuclear structure and spin observables.** W.G. Love (Dept. of Phys. & Astron., Univ. of Georgia, Athens, GA, USA), J.R. Comfort.
AIP Conf. Proc. (USA), no. 97, p.225 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
Some consequences of nonlocal spin-dependent terms in the effective N-N interaction are considered for nucleon-nucleus scattering. In particular, these terms are shown to probe the poorly understood spin current modes of nuclear excitation. The simultaneous presence of this type of coupling together with appreciable spin \otimes current transition densities can be observed experimentally by measuring the differences between polarizations and analyzing powers. Schematic calculations are given for $0^+ \rightarrow 1^+$ and $0^+ \rightarrow 0^-$ transitions to illustrate the role of spin \otimes current couplings in calculations of P-A DWIA calculations have been made for the $^+1^+$ transition which support the more transparent schematic considerations. (4 refs.)
- 74854 Mesons and isobars.** M. Rho (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
AIP Conf. Proc. (USA), no. 97, p.350-64 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
Meson and isobar degrees of freedom in nuclei are discussed in terms of the way chiral symmetry manifests itself in nuclear medium. A particular emphasis is placed on the role that pions (as the Goldstone bosons) play in enhancing and quenching the effective axial charge g_A^{eff} measured in some nuclear spin-isospin modes. (33 refs.)
- 74855 Three-body forces.** J.L. Friar (Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no. 97, p.378-88 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
Three-body forces are defined and their properties discussed. Evidence for such forces in the trinucleon bound states and scattering reactions is reviewed. The binding energy defects of the trinucleon bound states, the ^3He charge density, the Phillips line for doublet n-d scattering lengths, and three-nucleon breakup reactions are discussed, together with the possible influence of three-body forces on these observables. (23 refs.)

74856 Quarks, bags and the nucleon-nucleon interaction. G.E.Brown (State Univ. of New York, Stony Brook, NY, USA). *AIP Conf. Proc. (USA)*, no.97, p.389-97 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). It is argued that pionic couplings have a greater influence on the short-range nucleon-nucleon interaction than the quark degrees of freedom. (20 refs.)

74857 The nucleus consists of more than just nucleons, deltas and mesons. G.A.Miller (CERN, Geneva, Switzerland). *AIP Conf. Proc. (USA)*, no.97, p.408-12 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The possibility that quark degrees of freedom have significant effects in nuclear physics is discussed. (24 refs.)

74858 Charge-dependent three-body force with isobar excitations. Shin Nan Yang (Dept. of Phys., Nat. Taiwan Univ., Taipei, Taiwan). *J. Phys. G (GB)*, vol.9, no.6, p.L115-18 (June 1983). The charge-dependent three-body force which involves the exchange of one photon and one pion together with the presence of one virtual-nucleon excited state (isobar) is considered. Its contribution toward the Coulomb energy difference of ^3He - ^3H is estimated to be negligible. (13 refs.)

74859 The nucleon-meson coupling vertex-structure and the process for the meson exchange in nuclear force. He Hanxin, Zhuo Yizhong, Sa Benhao (Inst. of Atomic Energy, Acad. Sinica, Beijing, China). *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol.28, no.3, p.321-4 (March 1983). Since the sixties the meson exchange theory has been so developed that it can explain the nuclear force quite well. The success of the quark model and the development of quantum chromodynamics (QCD) make one hope to understand the mechanism of the nuclear force more deeply. From the viewpoint of the quark model and QCD, the nuclear force appears as interactions caused by exchanging the colour-gluons among the quarks that constitute the nucleons. When the two nucleons come near enough to have an overlap, the exchange of the colour-gluons not only exists among the quarks inside a nucleon but also occurs between the quarks of two different nucleons. And the quarks of a nucleon can be scattered into the configuration of another nucleon, which gives a lowest order process of exchanging the gluons and quarks between the two nucleons. Due to the asymptotically-free and the confined properties of the QCD, this process of the one-gluon exchange comes about only in a very localized spacetime region and so it can be expected to make contribution to the short-range part of nuclear force. In addition, there exist the two-gluons exchange and the exchange of colour-singlet quark-antiquark ($q\bar{q}$)-pairs between two nucleons. One can thus expect these processes to be able to contribute to the intermediate-range and the long-range parts of nuclear force. (6 refs.)

74860 Relativistic two-nucleon calculations on the light front. L.Muller (Inst. fur Theoretische Phys. II, Ruhr-Univ., Bochum, Germany). *Nuovo Cimento A (Italy)*, vol.75A, ser.2, no.1, p.39-61 (1 May 1983). The relativistic theory for few-nucleon systems developed by Glockle and Muller (1981) is transformed into the light front formalism. For a model of scalar particles exchanging scalar mesons the 10 generators of the Poincare group are derived in pure particle space up to lowest order in the coupling. Because of the impossibility of a complete partial-wave decomposition on the light front, only bound states can be calculated numerically. This is done for the two-body system. The results differ from those at an instant because of the omission of higher-order terms. (15 refs.)

74861 Three-nucleon interaction in 3-, 4- and ∞ -body systems. J.Carolson, V.R.Pandharipande (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), R.B.Wiringa. *Nucl. Phys. A (Netherlands)*, vol.A401, no.1, p.59-85 (30 May 1983). The authors report results of variational calculations of ^3H , ^3He , ^4He and nuclear matter with the Urbana v_{14} two-nucleon interaction and realistic models of the three-nucleon interaction (TNI). These include the Tucson and isobar intermediate-state models of the two-pion exchange TNI. The latter is also studied with an intermediate-range three-nucleon repulsion. In general realistic TNI helps to bring the theory closer to experiment by giving extra binding energy to the $A=3$ and 4 nuclei and providing extra saturation to the nuclear matter binding energy. The Coulomb energy of ^3He and the r.m.s. radii of $Z=3,4$ nuclei are also well described. However, some problems remain unresolved. There is a slight overbinding of ^4He , an underbinding of nuclear matter, and the charge form factors of ^3He and ^4He , calculated with impulse approximation, deviate from the experimental at $q^2>5\text{ fm}^{-2}$. (35 refs.)

74862 Interplay between two- and three-body interaction in light nuclei and nuclear matter. R.B.Wiringa (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA). *Nucl. Phys. A (Netherlands)*, vol.A401, no.1, p.86-92 (30 May 1983). A recent study of different models of three-nucleon interaction (TNI) in ^3He , ^3H , ^4He and nuclear matter is extended to study the influence of different choices of the accompanying two-body interaction. A new two-body potential, Argonne v_{14} , is coupled with both the Tucson and isobar intermediate-state models of two-pion-exchange TNI, with a phenomenological intermediate-range repulsive TNI added to the latter. Variational calculations are carried out for these systems, and compared to the earlier work. The author finds that a stronger tensor component in the two-body potential, as typified by a larger deuteron percentage, gives more attraction for the TNI, counteracting the saturation effect obtained when only two-body forces are considered. (17 refs.)

74863 Three-body forces in sd-shell nuclei. A.Polls, H.Muther, A.Faessler (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany), T.T.S.Kuo, E.Osnes. *Nucl. Phys. A (Netherlands)*, vol.A401, no.1, p.124-42 (30 May 1983). The influence of three-body forces on the excitation spectra of nuclei with 3 valence nucleons in the sd-shell is investigated. Three-body forces are considered, which arise from an intermediate excitation of the interacting nucleons to the $\Delta(3,3)$ resonance. Besides these real three-nucleon forces, effective three-body interactions are taken into account which are due to the restriction of the nuclear structure calculation to sd-shell configurations. Significant cancellations are observed between the different contributions to the effective three-nucleon force. The resulting three-body matrix elements yield only a small influence on the spectrum of the $A=19$ systems. The typical size of the matrix elements, however, is large enough to expect a serious influence on the results of shell-model calculations with more than three valence nucleons. (35 refs.)

74864 Real part of the nuclear interaction potential between α or p and excited heavy nuclei. X.S.Chen, C.Ngo, E.Tomasi (CENS, Gif-sur-Yvette, France), M.Barranco, X.Vinas, H.Ngo. *Nucl. Phys. A (Netherlands)*, vol.A401, no.1, p.143-56 (30 May 1983). The authors investigate, within a very simple double folding model, the nuclear interaction potential between α or p and excited heavy nuclei. The densities of the excited nuclei are calculated using a modified hot Thomas-Fermi model. Simple analytical expressions of the results are presented. The consequences of this calculation on evaporation probabilities is qualitatively discussed. (12 refs.)

74865 The heavy-ion potential and its increasing transparency at intermediate energies. A.Faessler, L.Rikus, S.B.Khadkikar (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany). *Nucl. Phys. A (Netherlands)*, vol.A401, no.1, p.157-74 (30 May 1983). Starting from the Reid soft-core potential and the collision of two nuclear matters the authors solve the Bethe-Goldstone equation for the complex reaction matrix. The local density approximation including a Bethe-Goldstone equation for the complex reaction matrix. The local density approximation including a finite range correction enables one to calculate the volume part of the optical potential between two heavy ions up to 100 MeV per nucleon. The surface contributions are calculated data for ^{16}O - ^{16}O are nicely reproduced including the reduction of the reaction cross section above 20 to 30 MeV per nucleon. The maximum of the reaction cross section at 10-20 MeV per nucleon is essentially due to the surface contributions. The description of the ^{12}C - ^{12}C data is not so satisfactory due to the assumption of weak coupling and the neglect of some rotational excitations. (26 refs.)

74866 Classification of exchange currents. J.L.Friar (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA). *Phys. Rev. C (USA)*, vol.27, no.5, p.2078-84 (May 1983). After expansion of the vector and axial vector currents in powers of (v/c) , a heretofore unremarked regularity results. Meson exchange currents can be classified into types I and II, according to the way they satisfy the constraints of special relativity. The archetypes of these two categories are the impulse approximation to the vector and axial vector currents. After a brief discussion of these constraints, the $(\rho\pi\gamma)$ and $(\omega\pi\gamma)$ exchange currents are constructed and classified, and used to illustrate a number of important points which are often overlooked. (29 refs.)

74867 Coupled bound and continuum eigenstates in momentum space. R.H.Landau (Dept. of Phys., Univ. of Surrey, Guildford, England). *Phys. Rev. C (USA)*, vol.27, no.5, p.2191-7 (May 1983). Described is a procedure for solving in momentum space the Coulomb plus nuclear problem for coupled bound and continuum eigenstates. The method is an extension of the Kwon-Tabakin (1978) formulation of the Lande subtraction technique. Complex eigenenergies are now determined after formulating and incorporating the correct momentum space 'boundary conditions' into the Schrodinger equation. This exact numerical procedure can be applied to local or nonlocal, complex or real potentials even with relativistic kinematics. Application to the K^-p problem and other systems with strongly coupled absorptive channels is indicated. (22 refs.)

21.40 FEW-NUCLEON SYSTEMS

74768 Mass dependence of the real optical model potential for light ions. D.K.Srivastava, N.K.Ganguly, D.N.Basu (Variable Energy Cyclotron Centre, Calcutta, India).

Phys. Lett. B (Netherlands), vol.125B, no.4, p.260-4 (2 June 1983).

The observed target mass dependence of the volume integral per interacting nucleon pair of the real optical model potential for deuterons, helium-3 and alpha particles is explained in terms of the density dependence of the effective projectile-nucleon interaction. A mass dependence function for light ions is derived, which for density dependent forces consists of a volume, a surface, a curvature, and a higher order correction term. For non-saturating forces, this has only the volume term and fails to account for the observed mass dependence. (22 refs.)

74769 Conventional approach to the problem of the deuteron smearing corrections. D.Kusno (Dept. of Phys., Univ. of Indonesia, Jakarta, Indonesia), M.J.Moravcsik.

Phys. Rev. C (USA), vol.27, no.5, p.2173-90 (May 1983).

A comprehensive analysis of the problem of deuteron smearing corrections is given. Some problems of the usual approach (the conventional approach) are discussed. It is shown that the formalism adopted by this approach leads to (i) the existence of the so-called West β correction and (ii) the disagreement of the sum rules with the quark parton model expectations in leptonic scattering. It is also shown that in this formalism the electroproduction expression is not inconsistent. Following West for the identification of the wave function it is found that the smearing correction σ_e of the high-energy (50-370 GeV) pion and nucleon process is non-negligible and, hence, in contradiction with the usual expectations. Another test for this approach is suggested. (30 refs.)

74770 A radiochemical study on the existence of dineutron. K.Otozai (Dept. of Chem., Faculty of Sci., Osaka Univ., Osaka, Japan), T.Sekine, R.Arakawa, K.Hata, T.Saito, H.Baba.

Z. Phys. A (Germany), vol.311, no.4, p.303-9 (1983).

A radiochemical study has been made to search for dineutron 2n produced in the simultaneous two-neutron emission of the excited $^6\text{He}^*$ nuclei, $^6\text{He}^*$, induced in the reaction of $^9\text{Be} + n \rightarrow ^6\text{He}^* + \alpha$ with fast neutrons in a reactor. It was attempted to detect the radioactivity of ^{28}Mg as a product of the reaction $^2n + ^{27}\text{Al} \rightarrow ^{28}\text{Mg} + p$. The ^{28}Mg radioactivity observed in heterogeneous samples composed of the 2n -producing target Be and the 2n -detecting target Al separately was not found to be more than that of a side reaction, $^{27}\text{Al}(n,p)(n_{\text{th}},\gamma) + (n_{\text{th}},\gamma)(n,p)^{28}\text{Mg}$, whereas it clearly exceeded that of the side reaction in alloy samples made of Be and Al metals. The former experiment gives an upper limit of the production rate of the dineutron in the bound state 1×10^{-7} per event of the simultaneous two-neutron emission. A tentative explanation for the excessive ^{28}Mg radioactivity observed in the latter experiment is the following two-step process, $^9\text{Be} + n \rightarrow ^6\text{He} + \alpha$ and $^{27}\text{Al} + ^6\text{He} \rightarrow ^{28}\text{Mg} + \alpha + p$, rather than the process induced by the dineutron in a virtual state. 21.60 NUCLEAR-STRUCTURE MODELS AND METHODS

(for hadronic atoms and molecules, see 36.10)

74771 Comparison of upper and lower bound methods using a soluble many-Fermion model. M.C.Cambiaggio, A.Klar, F.J.Margetan, A.Plastino, J.P.Vary (Phys. Dept., Iowa State Univ., Ames, IA, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2340-55 (May 1983).

Upper bounds, lower bounds, and estimates based on moments are compared for the ground state energy of a soluble Hamiltonian due to Lipkin (1965). Several bounding methods based on variational approaches and one based on the method of moments are employed. The authors show that lower bounds are of comparable quality with upper bounds and are no more difficult to obtain. No single bounding method is found superior over the entire range of parameters they study for the soluble Hamiltonian. However, in one region they find an upper bound from one method which coincides with the lower bound of another method, thus yielding the exact ground state energy. They also show that estimation methods based on the easily calculated first and second moments of the eigenvalue distribution are surprisingly accurate for a wide range of coupling parameters and number of active particles. (19 refs.)

74772 Statistical spectroscopy. J.B.French, V.K.B.Kota (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).

In book: *Annual review of nuclear and particle science*. Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.35-64. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

The authors' aim in this article, which may serve as an introduction to more extensive reviews, is to make clear the principles and, without technical detail, something of the methods, results, possibilities, and limitations of statistical spectroscopy. (56 refs.)

21.60E Collective models

74774 Description of the neutron deficient Sr and Zr isotopes in the interacting boson model. D.Bucurescu, G.Cata, D.Cutoiu, G.Constantinescu, M.Ivascu, N.V.Zamfir (Central Inst. of Phys., Bucharest, Rumania).

Nucl. Phys. A (Netherlands), vol.A401, no.1, p.22-40 (30 May 1983).

The available experimental data for the neutron deficient isotopes of Sr (78 to 86) and Zr (80 to 86) are collected and compared to the predictions of IBA-1 model calculations. The variations of the collectivity along these two isotopic chains is well reproduced with a set of smoothly varying parameters of the model. The description of both the energy levels and the $B(E2)$ transition probabilities improves with decreasing N , the Hamiltonian evolving towards an $\text{SU}(3)$ dynamical symmetry. Both the large $B(E2)$ value of the $2_1^+ \rightarrow 0_{g.s.}^+$ transition and the predicted prolate shape for the very light isotopes, agree well with the recent findings of superdeformed nuclei around $Z, N \approx 38$. Transition strengths for the (p,t) reaction are calculated and compared to experimental observations for $0^+ \rightarrow 2^+$ states, and a discussion is made about the possible intruder character of the 0_2^+ state. The interacting boson-fermion approximation model is used to extend the calculations to some odd nuclei. Two shell $(1g_{7/2}, 2d_{5/2})$ calculations are performed for the positive-parity states in ^{83}Sr , ^{85}Sr and ^{85}Y and they compare well with the experimental level scheme of these nuclei below 3 MeV excitation. (46 refs.)

74775 Volume conservation in the liquid drop model. R.Gilmore, Da Hsuan Feng (Dept. of Phys. & Atmospheric Sci., Drexel Univ., Philadelphia, PA, USA).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.99-102 (26 May 1983).

Although the $L=0$ (breathing) mode does not conserve volume and the $L=2$ (quadrupole) mode conserves volume only to first order, both modes together can conserve volume to second order when a certain interference relation among the six mode amplitudes is satisfied. The quantized versions of the liquid drop model with volume conservation imposed to first and to second order have different dynamical groups $[\text{U}(5), \text{U}(6)]$, respectively, different Hilbert spaces (infinite dimensional, finite dimensional, respectively), and different rotationally invariant operators from which Hamiltonians can be constructed. (8 refs.)

74776 Major shell centroids in the symplectic collective model. J.P.Draayer (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA), G.Rosensteel.

Phys. Lett. B (Netherlands), vol.125B, no.4, p.237-9 (2 June 1983).

Analytic expressions are given for the major shell centroids of the collective potential $V(\beta,\gamma)$ and the shape observable β^2 in the $\text{Sp}(3,\text{R})$ symplectic model. The tools of statistical spectroscopy are shown to be useful, firstly, in translating a requirement that the underlying shell structure be preserved into constraints on the parameters of the collective potential and, secondly, in giving a reasonable estimate for a truncation of the infinite dimensional symplectic model space from experimental $\beta(E2)$ transition strengths. Results based on the centroid information are shown to compare favorably with results from exact calculations in the case of ^{20}Ne . (12 refs.)

74777 The macroscopic approach to nuclear masses and deformations. W.D.Myers, W.J.Swiatecki (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

In book: *Annual review of nuclear and particle science*. Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.309-34. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

After approximately half a century of nuclear physics there is available today a large amount of experimental information on the masses and deformation energies of nuclei relatively close to the line of beta stability. The interpretation of these measurements has improved over the years and has been integrated into detailed theories of nuclear structure and deformabilities. The resulting understanding of both the gross features, as approximated by a liquid-drop or droplet model formula, and of the fine shell effect details, calculated using the Strutinsky method, is generally adequate to account for the binding energies with an accuracy that may be considerably better than 1 MeV (better than 0.1%) for short-range extrapolations, but becomes uncertain for more distant extrapolations. The relatively recent breakthrough in describing quantitatively the shell effects was associated with the indirect approach, in which shell corrections are added to a smooth background, provided by the liquid-drop model. In the future the direct approach of attacking the full many-body problem (in a suitable approximation) may become relatively more important. (126 refs.)

74878 Quantum mean-field theory of large-amplitude collective motion. F.E.Serr, J.W.Negele, G.Vichniac (Dept. of Phys., MIT, Cambridge, MA, USA).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.127.
A fundamental problem in nuclear physics is the formulation of a systematic quantum theory of collective motion for finite nuclei. The present work seeks insight on a set of time-dependent mean-field equations obtained by evaluating an appropriate functional integral representation of the evolution operator in the stationary phase approximation (SPA). Solutions to the SPA equations with real period correspond to eigenfunctions of large-amplitude collective motion. (2 refs.)

74879 Mass parameters for collective nuclear motion based on a diabatic single-particle basis. A.Lukasiak, W.Cassing, W.Norenberg (Gesellschaft für Schwerionenforschung, Darmstadt, Germany).
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.128.
For collective kinetic energies per nucleon in the range 1/40 MeV $\leq E_{coll}/A \leq 40$ MeV adiabatic s.p. motion ceases to be valid because jump-probabilities at quasi-crossings of the adiabatic levels near the Fermi energy are close to 1. The authors include this type of transition in a quasi-static diabatic basis by a local transformation of the adiabatic states in which the nodal structure of the wavefunctions is preserved throughout the collective motion. First order perturbation theory with respect to $i\hbar q \partial/\partial q$ (q : parameter for the collective degree of freedom) then yields the 'diabatic' cranking model and corresponding expressions for the collective mass parameters are obtained. (2 refs.)

21.60J Hartree-Fock and random-phase approximations

74880 Relativistic Brueckner-Hartree-Fock theory: theoretical foundations and empirical evidence. C.M.Shakin (Dept. of Phys., Brooklyn Coll., City Univ. of New York, New York, NY, USA).
AIP Conf. Proc. (USA), no.97, p.299-324 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
It is suggested that the nucleon mass may be quite different in the interior of a large nucleus than in free space. The consequences of this assumption are explored using a model based on the one-boson-exchange model of the nuclear force. The author presents the results of parameter-free calculations of nuclear saturation curves, of the density and momentum-transfer dependence of the effective force in nuclei, and of the energy and density dependence of the nuclear optical potential. They also put forth some speculations concern-

ing the relation of boson-exchange models and quark models of the nucleon-nucleon interaction. (31 refs.)

74881 σ_+ strength in nuclei. D.Cha (Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
Phys. Rev. C (USA), vol.27, no.5, p.2269-81 (May 1983).
The σ_+ strength function is studied with the quasiparticle random phase approximation. The residual interaction modifies the pairing theory strength function in two ways. The particle-hole interaction reduces the overall strength by about a factor of 2, without shifting strength between different levels. The particle-particle interaction does not affect the overall strength, but shifts part of the strength from the lowest excitation to a higher excitation energy region. By comparing the theory with the observed $\log(f_i)$ values of the β^+ decay in medium heavy nuclei, the author finds that an additional quenching is required for the σ_+ mode, similar in magnitude to the additional quenching present in other isovector-spin-flip transitions. Finally, the author predicts that there is a large concentration of the σ_+ strength at higher excitation energy which cannot be observed by the β^+ decay. (47 refs.)

74882 Triaxial Hartree-Fock-Bogolyubov calculations with $D1$ effective interaction. M.Girod (Service de Phys. Neutronique et Nucleaire, Centre d'Etudes de Bruyeres-le-Chatel, Montrouge, France), B.Grammaticos.
Phys. Rev. C (USA), vol.27, no.5, p.2317-39 (May 1983).
The Hartree-Fock and Hartree-Fock-Bogolyubov methods are used for the description of nuclei and triaxial (i.e. ellipsoidal) shapes. The Gogny $D1$ finite range density dependent interaction is employed. A comparison between various prescriptions for the calculation of pairing correlations in nuclei indicates the necessity for the self-consistent treatment of pairing. Using this last method the authors obtain results concerning nuclear shapes and deformation energy surfaces for nuclei ranging from the lightest ones to the fission barrier of ^{240}Pu . (34 refs.)

74883 Theory of giant resonances. K.Goeke, J.Speth (Inst. für Kernphys., Kernforschungsanlage Jülich, Jülich, Germany).
In book: *Annual review of nuclear and particle science*. Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.65-115. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]
The authors review the basic microscopic theories suitable for describing collective motion in finite Fermi systems. They view the nucleus as a system of independently moving quasi-particles in a way which allows an easy transition to infinite nuclear matter. First, they recall some basic concepts of time-dependent Hartree-Fock, Landau theory, and transport equations. Second, the resulting equations are considered in their small-amplitude limit, assuming the giant resonances to be harmonic vibrations around some static equilibrium state. This results basically in the random phase approximation and the corresponding zero-sound equation in nuclear matter. Various sum rules are formulated with respect to the RPA strength distribution associated with a given transition operator. These are used to relate other classical and semiclassical theories like the generator coordinate method or adiabatic time-dependent Hartree-Fock to RPA. In the last subsection, fluid dynamical and hydrodynamical approaches and their relationship to RPA and Landau's theory are reviewed and the concept of zero sound is discussed. (184 refs.)

21.65 NUCLEAR MATTER

74884 Effective interactions at low and intermediate energy. C.Mahaux (Max-Planck-Inst. für Kernphys., Heidelberg, Germany).
AIP Conf. Proc. (USA), no.97, p.20-43 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
Brueckner's reaction matrix g is an attractive candidate for the effective nucleon-nucleon interaction at positive as well as at negative energies. At positive energies, numerical calculations have been limited to nuclear matter; the results are then applied to finite nuclei with the help of local density approximations. Even in the case of nuclear matter, g is a complicated operator since it is nonlocal, state-dependent, nonhermitian and density-dependent. Further work is needed concerning the definition and the calculation of g in nuclear matter, its replacement by local operators, the local density approximation, the comparison with experimental data and with empirical effective interactions, and the relationship with the multiple scattering approach. (85 refs.)

74885 Microscopic optical potentials. H.V.von Geramb (Theoretische Kernphys., Univ. Hamburg, Hamburg, Germany).
AIP Conf. Proc. (USA), no.97, p.44-77 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
Various versions of infinite nuclear matter reaction matrix elements (t -matrix elements) are generated from free NN potentials. Most emphasis is put on calculations with the momentum dependent Paris potential as input. A complex energy and density dependent interaction (25-500 MeV) is parameterised with convenient Yukawa-form factors to serve as effective interaction. Studies concentrate on elastic channel microscopic optical model potential and its general structure as compared to phenomenological potentials. Further detailed checks on the effective interactions are performed with exemplary studies of (p,p') transitions. (18 refs.)

74886 Correlated basis theory of nucleon optical potential in nuclear matter. S.Fantoni, B.L.Friman, V.R.Pandharipande (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
AIP Conf. Proc. (USA), no.97, p.234-49 (1982). [received: May 1983]
(Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
The authors give a brief and simple outline of correlated basis perturbation theory and discuss the criterion for choosing the correlation operator. Next they discuss the choice of the nuclear Hamiltonian and give results obtained for nuclear binding energies, and the real and imaginary parts of the nucleon optical potential in nuclear matter. The effect of the nonlocality of the real part of the optical potential on the imaginary part is also discussed. (19 refs.)

74887 The imaginary part of the relativistic optical potential. C.J.Horowitz (Dept. of Phys., MIT, Cambridge, MA, USA). *AIP Conf. Proc. (USA)*, no.97, p.329-36 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The imaginary part of the relativistic optical potential is calculated in nuclear matter for the Walecka $\sigma + \omega$ model. Large Lorentz scalar and vector contributions are found in addition to an important three-vector potential. (9 refs.)

74888 Hot, dense matter in the bulk equilibrium approximation. II. Adiabats and alpha-particle effects. M.Pi, M.Barranco (Física Atomica y Nuclear, Facultad de Física, Univ. de Barcelona, Barcelona, Spain), S.Marcos. *Nuovo Cimento A (Italy)*, vol.75A, ser.2, no.1, p.100-12 (1 May 1983). The equation of state (EOS) of hot, dense matter is computed along two adiabats, $s=1$ and $s=1.5k$, neglecting effects associated with finite nuclear size. Detailed comparison with the results previously obtained from a more involved calculation which includes the effects here neglected shows how good the bulk approximation really is. Next, the authors have systematically included alpha-particles as free Boltzmann particles first, and finally they have taken into account the alpha-nucleon interaction in an approximated way via the virial expansion. In the range of temperatures and densities they are interested in, alpha-particles are very rare and their contribution to the equation of state is less important than plasma effects which are generally not considered in EOS calculations. (19 refs.)

74889 Shape transitions and isotope shifts of proton and neutron distributions in the samarium isotopes. J.Janecek, F.D.Becchetti (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA). *Phys. Rev. C (USA)*, vol.27, no.5, p.2282-91 (May 1983). The isotope shifts of the radii of the distributions of neutron and nucleon matter in the samarium isotopes are deduced by combining data from X-ray, muonic X-ray, and optical isotope shift measurements of charge (proton matter) radii with data for the isotope shifts of Coulomb displacement energies. The average isotope shifts from $A=144$ (spherical) to $A=154$ (deformed) are nearly the same for proton and neutron matter with $\gamma_N \approx 1.3$ or $(\rho_N)^{1/2} \propto A^{1/3}$. The neutron matter radii increase more rapidly than the proton matter radii in the region of the light transitional Sm isotopes. The transition from spherical to deformed ground states between $N=88$ and 90 is accompanied by a strong increase in the radius of the proton matter distribution ($\gamma_N \approx 1.9$), whereas the radius of the neutron-excess matter distribution remains almost constant ($\gamma_N \approx 0.0$). The data suggest strong even/odd staggering effects for both proton and neutron matter radii which are out of phase. The droplet model of the atomic nucleus when combined with experimental deformation parameters describes the isotope shift of the charge radii very well. The influence of zero-point vibrations in the light transitional Sm isotopes is apparent. The isotope shift of the neutron matter radii appears to be overestimated. The interacting boson model is found to describe the isotope shift of neutron matter radii satisfactorily but fails to reproduce the isotope shift of the charge radii. (44 refs.)

74890 Hot dense nuclear matter and the transition to quark matter. C.J.Horowitz, H.Schulz (Central Inst. for Nuclear Res., Rossendorf, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.137. In order to calculate the phase transition of hot nuclear matter to quark matter the hot dense nuclear matter is described in relativistic Hartree and Hartree-Fock approximation under consideration of π -N interactions producing particle-hole and delta-hole excitations. The thermodynamic properties of the quark-gluon plasma are calculated in perturbative QCD in lowest non-trivial order of the quark-gluon coupling. For the nucleon degrees of freedom the authors obtain good agreement between relativistic Hartree and Hartree-Fock calculations as well as between these calculations and non-relativistic variational results. They find large increase in excitation energy and pressure due to pionic excitations which shift the baryon-quark matter phase transition to significantly higher temperatures where the sensitivity of the phase boundary to the values of the vacuum energy and the quark-gluon coupling constant is reduced. (4 refs.)

74891 First order phase transition in hot nuclear matter? H.Schulz, L.Munchow, G.Ropke, M.Schmidt (Central Inst. for Nuclear Res., Rossendorf, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.139. Hot nuclear matter is considered in a quantum statistical approach taking into account the formation of clusters. The equation of state is obtained calculating the one-particle Green function in a ladder Hartree-Fock approximation. It shows a behaviour similar to that of a non-ideal gas with the characteristic van der Waals instabilities. Below the critical temperatures $T \approx 20$ MeV one reaches the phase unstable region. (4 refs.)

74892 Liquid gas phase instabilities in nuclear systems. M.W.Curtin, H.Toki, D.K.Scott (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA), P.J.Siemens. Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.144. The conventional approach to composite fragment production in HI collisions from a single gaseous phase may require modification at temperatures below 20 MeV due to the onset of a liquid-gas phase instability. At high energies, corresponding to high temperatures, the yield of composite fragments falls off monotonically as a function of particle mass. This behavior is expected for emission of clusters from a high temperature, single gaseous phase where the composite production cross section can be related to a power of the nucleon cross section. In the region of $E_{\text{inc}} \approx 100$ MeV/u corresponding to $T \approx 20$ MeV, the distribution flattens and at still lower temperatures the trend reverses so that the alpha particle yield exceeds that of lighter particles. Due to the anomalously large binding energy of the α particle it is suggested that larger fragment masses be measured to determine if a liquid component exists during disassembly. A macroscopic approach is investigated using a Skyrme interaction with constants determined from $T=0$ nuclear matter considerations. Assuming these parameters are not temperature dependent, the pressure is calculated. Similarities with a Van der Waals system are observed. The coexistence region is mapped out and the critical temperature $T \approx 20$ MeV is extracted. (no refs.)

21.80 HYPERNUCLEI

74893 Weak decay of a hypernuclei. R.Grace (Carnegie-Mellon Univ., Pittsburgh, PA, USA). *AIP Conf. Proc. (USA)*, no.97, p.426 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).

A hypernucleus must ultimately decay by a weak process after the more rapid strong and electromagnetic (strangeness conserving) processes are finished. There exists four weak decay modes for a hypernucleus: $\Lambda \rightarrow p + \pi^-$, $\Lambda \rightarrow n + \pi^0$ (mesonic decay); $\Lambda + p \rightarrow n + p$; $\Lambda + n \rightarrow n + n$ (nonmesonic decay). The mesonic decay modes are dominant in very light hypernuclei while the nonmesonic decay modes are dominant in heavier hypernuclei and depend on the four fermion weak interaction. This experiment is designed to test the understanding of this interaction. (no refs.)

74894 Λ -N interaction and the structure of ^4He , ^4H , ^3He and ^3H . Wu Hui-fang, Shen Jian-ping, Yu You-wen, Zhang Zong-ye (Inst. of High Energy Phys., Acad. Sinica, Beijing, China). *Commun. Theor. Phys. (China)*, vol.1, no.4, p.449-57 (1982).

The authors study the Λ -N interaction by using the meson exchange theory. They have considered four processes: (1) single K meson exchange, (2) single η and single ω meson exchange, (3) box diagrams of 2π and $\pi\rho$ exchanges with the intermediate states of ΣN , and (4) box diagrams of 2π and $\pi\rho$ exchanges with the intermediate states of $\Sigma\Delta$. For simplicity, the zero initial momentum approximation and the closure approximation have been taken in the calculation. The results are reasonable and consistent with experimental data. Especially for the cases of ^4He and ^4H , the theoretical spectra of ^4He and ^4H are in good agreement with the experimental data. (4 refs.)

74895 Binding energy estimates for charmed few-body systems. B.F.Gibson (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), C.B.Dover, G.Bhamathi, D.R.Lehman. *Phys. Rev. C (USA)*, vol.27, no.5, p.2085-9 (May 1983).

By solving exact three- and four-body equations, the authors obtain estimates of the binding energies of light nuclei containing one charmed C_0^+ baryon. (20 refs.)

74896 Resonances in hyperon-hyperon systems. G.Bhamathi (Dept. of Theoretical Phys., Univ. of Madras, Madras, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.64.

Summary form only given, as follows. Recently elaborate theoretical studies have been made on the Σ and Ξ hypernuclei. Since the Ξ particle has strangeness -2 studies on (Ξ p) and other Ξ hypernuclei depend to a considerable degree on the exact knowledge of the interaction in other communicating channels such as $\Lambda\Lambda$, $\Lambda\Sigma$, $\Sigma\Sigma$, etc. One boson exchange models with the additional assumption of SU(3) symmetry have played a large role in determining the nature of the forces in these various systems. The author reports results on a detailed study of hyperon-hyperon interactions treated non-relativistically. Interesting resonance phenomena are found to be present in the singlet state, which are discussed in detail.

Certain rare hypernuclear decays See Entry 74768

23.00 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS

(see also 82.55 Radiochemistry)

23.20 ELECTROMAGNETIC TRANSITIONS

74897 Nuclear orientation of ^{152}Eu in gold. P.J.Blamey (Dept. of Otolaryngology, Univ. of Melbourne, Parkville, Victoria, Australia), D.Bingham, A.J.Barclay, J.D.Cashion. *Aust. J. Phys. (Australia)*, vol.36, no.2, p.127-33 (1983).

Nuclear orientation of ^{152}Eu in gold in the temperature range 9 mK—1 K has been used to determine the mixing ratios of a number of gamma transitions and the multipolarities of several beta transitions of the ^{152}Eu decay scheme. The results agree closely with those from γ - γ and γ - β angular correlation measurements where these have been done. The authors results on the hyperfine interaction of ^{152}Eu in gold contradicted those previously published. (20 refs.)

74898 Excitation of M1 strength in N=28 isotones by inelastic proton scattering at 200 MeV. N.Anantaraman, G.M.Crawley, A.Galonsky (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA), C.Djalali, N.Marty, M.Morlet, A.Willis, J.-C.Jourdain. *AIP Conf. Proc. (USA)*, no.97, p.224 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).

High-energy inelastic proton scattering at very forward angles has been found to selectively excite M1 states. The authors have used this reaction to study the M1 strength distribution in the N=28 isotones ^{48}Ca , ^{50}Ti , ^{51}V and ^{54}Fe . The measurements were performed with a beam of 201 MeV protons from the Orsay synchrocyclotron. (23 refs.)

74899 Isovector M1 transition matrix elements. I.S.Towner, F.C.Khanna (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada). *AIP Conf. Proc. (USA)*, no.97, p.405 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).

Corrections to isovector M1 transition matrix elements are calculated in a model that incorporates the important dynamical aspects of nuclear structure (core polarisation, CP) meson exchange currents (MEC) and isobar currents (IC). The residual interaction is approximated by a one-boson-exchange potential and a short-range correlation function is introduced. (1 ref.)

74900 Low energy spectrum and directional correlation measurements in ^{187}Re . K.Singh, B.S.Grewal, R.Mittal, H.S.Sahota (Phys. Dept., Punjab Univ., Patiala, India).

Indian J. Pure & Appl. Phys., vol.21, no.2, p.107-11 (Feb. 1983).
The gamma ray spectrum of ^{187}Re in the low energy region 0-150 keV has been measured using a high resolution low energy intrinsic Ge detector. The controversial 7.1 keV transition has been confirmed. Also a new transition of energy 125.85 keV has been detected. Gamma-gamma directional correlations are measured for the 72-134 and 552-134 keV cascades. The multiple characters for 72, 134 and 552 keV have been assigned as $E1 + [2.7(7)\%M2, M1 + (2.9 \pm 0.3)\%E2]$ and $E1 + (4.75 \pm 0.75)\%M2$ respectively. (18 refs.)

74901 Gamma radiation from $^{50}\text{Cr}(p,p')^{50}\text{Cr}$ at $E=5.45-6.15$ MeV. M.Brenner, J.Nyberg (Dept. of Phys., Åbo Akad., Åbo, Finland), O.V.Chubinsky, Yu.F.Andronov.

J. Phys. G (GB), vol.9, no.6, p.683-9 (June 1983).
The gamma radiation due to the de-excitation of the 2_1^+ and 4_1^+ levels in ^{50}Cr was studied as a function of the energy, which was varied in 10 keV steps. In particular, strong peaks in the cross sections were observed for scattering to the 4_1^+ level. Using experimental data on spin-flip probability the contribution of the statistical mechanism to the excitation of the 2_1^+ level has been estimated. The estimated ratio $\Gamma_0/D_0 = 0.24$ was obtained for 11 MeV excitation of the compound nucleus. The contribution of direct reaction and isobaric analogue resonances to the cross section is discussed. (11 refs.)

74902 The moments of strength functions. G.G.Dussel, R.P.J.Perazzo, S.L.Reich, H.M.Sofia (Dept. de Física, Comisión Nacional de Energía Atómica, Buenos Aires, Argentina).

Nucl. Phys. A (Netherlands), vol.A401, no.1, p.1-21 (30 May 1983).
The authors show that moment of order n of the strength function is determined by the same order of the Brilloin-Wigner perturbative expansion. This fact is used to study the second moment for single-particle and collective excitations in the framework of nuclear field theory. They discuss the relationship of the second moment with the spreading width of the giant isovector $M1$ resonances in ^{208}Pb . (25 refs.)

74903 Fast $\Delta I=0$ M1 transitions in the band crossing region. P.Kennitz, J.Doring, L.Funke, E.Will, G.Winter (Zentralinstitut für Kernforschung Rosendorf, Dresden, Germany).

Phys. Lett. B (Netherlands), vol.125B, no.2-3, p.119-22 (26 May 1983).
Fast M1 transitions between states of equal spin have been found in $^{80,81,82}\text{Kr}$. They are interpreted as due to two-level mixings in connection with different alignment of particle angular momenta in the configurations involved. The large transition rates exclude a strong competition of proton and neutron components in the lowest $2q$ band. (10 refs.)

74904 Proton capture to excited states of ^{16}O : $M1$, $E1$, and Gamow-Teller transitions and shell model calculations. K.A.Snover, E.G.Adelberger (Nuclear Phys. Lab., Univ. of Washington, Seattle, WA, USA), P.G.Ikossi, B.A.Brown.

Phys. Rev. C (USA), vol.27, no.5, p.1837-65 (May 1983).
The authors have measured excitation functions of the γ rays resulting from the bombardment of ^{15}N by polarized and unpolarized protons in the energy range $E_p = 2.5-9.5$ MeV with emphasis on identifying dipole decays to the first (0^+) and second (3^-) excited states in ^{16}O . Resonances in γ_{12} are observed at $E_p = 16.21, 16.45, 16.82, 17.12, 18.03, 18.98, 19.90, 20.41$ MeV. The 16.21 and 17.12 MeV resonances in γ_{12} are identified as $M1$ decays of the $1^+ T=1$ states of the $6.05 \text{ MeV } 0^+$ state in ^{16}O . The measured ratio of reduced strengths $B(M1, \gamma_{12})/B(M1, \gamma_0)$ is 0.48 ± 0.03 for decays from the 16.21 MeV state and 0.55 ± 0.04 for decays from the 17.12 MeV state. The 18.03 MeV resonance is due to a $3^- T=1$ state in ^{16}O with a strength $\Gamma_{\gamma_{12}}/\Gamma = (1.96 \pm 0.27) \text{ eV}$ and the 18.98 MeV resonance is due to the $4^- T=1$ stretched particle-hole state with a strength of $(0.85 \pm 0.10) \text{ eV}$. They determine absolute particle and γ widths for these states. The $M1 \gamma_2$ width of the 18.98 MeV state ($7.1 \pm 3.1 \text{ eV}$), is in agreement with a shell-model calculation. Resonances in γ_3 are observed at 16.82 and 17.27 MeV and in γ_4 at 17.88 MeV. The excitation energies and widths of these levels as well as the strengths of the γ transitions suggest a $T=1$ character for all of the resonances for which capture γ rays are observed. Correspondences of their resonances to levels in ^{16}N are given. Strong α_1 branches for many of these states indicate isospin impurities. They compare γ widths, including ground-state $M1$ decays, and allowed β transition rates in $A=16$ nuclei with shell model calculations obtain rough agreement with the experimental results. Additional shell model calculations for $M1$ and Gamow-Teller decays in the $A=14, 15, 17$, and 18 nuclei are presented, which indicate that Gamow-Teller matrix elements are quenched by $\sim 20\%$ relative to shell model predictions and also relative to the spin part of the $M1$ matrix elements. (66 refs.)

74905 Population of ^{133}I from the beta decay of fission product ^{133}Te and the cluster-vibration model. H.G.Hicks, J.H.Landrum, E.A.Henry, R.A.Meyer (Lawrence Livermore Nat. Lab., Livermore, CA, USA), S.Brandt, V.Paar.

Phys. Rev. C (USA), vol.27, no.5, p.2203-16 (May 1983).
An automated rapid chemistry system has been used to isolate enriched sources of $12.4\text{-min } ^{133}\text{Te}$ from mixed fission products via the sequence $^{133}\text{Sb}(\beta)^{133}\text{Te}$. In addition, pure sources of ^{133}Te were obtained by using the reduction of Te^{VI} to Te^0 during the isomeric decay of $^{133}\text{Te}^m$. Singles, Compton suppression singles, and γ - γ coincidence $\text{Ge}(\text{Li})$ spectra were used to identify approximately 210 γ rays from the decay of ^{133}Te . This information was used to establish 38 levels below 3000 keV in ^{133}I . Cluster-vibration model calculations have been carried out for the $Z=53$ nucleus ^{133}I . The calculated level structure and transition probabilities are found to be in good agreement with the experimental results. (32 refs.)

74906 Collective excitations of ^{82}Kr observed by in-beam and decay spectroscopy and their characterization by the interacting boson model. R.A.Meyer, J.F.Wild (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), K.Eskola, M.E.Leino, S.Vaisala, K.Forssten, U.Kaup, A.Gelberg.

Phys. Rev. C (USA), vol.27, no.5, p.2217-38 (May 1983).
A comprehensive investigation of the excited states of ^{82}Kr has been carried out through the γ -ray spectroscopy study of the radioactive decay of $^{82}\text{Br}^{\text{I}}$ ($t_{1/2} = 35.3 \text{ h}$, $J^\pi = 5^-$), $^{82}\text{Br}^{\text{II}}$ ($t_{1/2} = 6.1 \text{ min}$, $J^\pi = 2^-$), $^{82}\text{Rb}^{\text{I}}$ ($t_{1/2} = 1.273 \text{ min}$, $J^\pi = 1^+$), and $^{82}\text{Rb}^{\text{II}}$ ($t_{1/2} = 6.2 \text{ h}$, $J^\pi = 5^-$), and in-beam studies using the $^{80}\text{Se}(\alpha, 2n\gamma)^{82}\text{Kr}$ reaction. The authors use the ^{82}Kr level structure they determined, to test the interacting boson model. They show that the interacting boson model calculation can account for the observed levels below 3 MeV provided the underlying shell structure is taken into account. A low energy four quasiparticle $v_{1/2}(g_{7/2})^2_{1/2} 4^-$ band is proposed and its mixing with the octupole band is discussed. (38 refs.)

74907 Levels in ^{204}Po from the decay of ^{204}At . R.G.Helmer, C.W.Reich (Idaho Nat. Engng. Lab., EG&G Idaho Inc., Idaho Falls, ID, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2248-60 (May 1983).
The electron-capture decay of ^{204}At (9 min) has been studied by means of γ and e^- multiscalar singles and γ - γ coincidence measurements with $\text{Ge}(\text{Li})$ and $\text{Si}(\text{Li})$ detector systems. The samples were produced by $\text{Ir}(^{16}\text{O}, xn)$ reactions and on-line isotope separation. About 50 γ -ray transitions have been assigned to the ^{204}Po decay, ~ 35 of which have been placed in a proposed level scheme for ^{204}Po . The energy of the $8^+ \rightarrow 6^+$ isomeric transition has been deduced to be 12.1 keV , and the half-life of the 8^+ isomer has been measured to be $150 \pm 10 \text{ ns}$. From these data, the $B(E2)$ value of this isomeric transition is found to be 3.7 Weisskopf units. The ^{204}At ground state is assigned an I^π value of 7^+ , which eliminates the need for some low-energy levels in ^{204}At and ^{200}Bi that were tentatively proposed in recent data evaluations, where a 5^+ assignment was made. (31 refs.)

74908 Average resonance capture studies of $^{162,164}\text{Dy}$. D.D.Warner, R.F.Casten, W.R.Kane (Brookhaven Nat. Lab., Upton, NY, USA), W.G.Gelley.

Phys. Rev. C (USA), vol.27, no.5, p.2292-310 (May 1983).
Primary γ -ray transitions in ^{162}Dy and ^{164}Dy have been studied following average resonance neutron capture with neutron beams of mean energy 2 and 24 keV . The averaging process guarantees the observation of the complete set of $J^\pi = 1^+(-), 2^+, 3^+, 4^+(-)$ states in ^{162}Dy (^{164}Dy) up to an excitation energy of 2 MeV . Use of the results of recent Monte Carlo calculations has been made to establish semiquantitative criteria for the J^π assignments. Further spin limitations have been imposed by the study of primary transitions following capture in the 2.72 and 3.68 eV resonances in ^{162}Dy and the 1.71 eV resonance in ^{164}Dy . The known completeness of the set of observed levels has been used to establish a correspondingly complete band structure in both nuclei. The results are discussed in the framework of both the interacting boson approximation and the geometrical model. (30 refs.)

74909 Boson number dependence of $E2$ transition rates in the rotational limit of the interacting boson model. P.Van Isacker (Centro de Estudios Nucleares, Univ. Nacional Autónoma de México, México City, México).

Phys. Rev. C (USA), vol.27, no.5, p.2447-50 (May 1983).
The author derives analytic expressions for $E2$ transition rates in the $\text{SU}(3)$ limit with a general $E2$ operator. With these expressions the influence of the boson number on the properties of a Michailov plot can be studied. (9 refs.)

23.40 BETA DECAY; ELECTRON AND MUON CAPTURE

74910 Gamow-Teller transition matrix elements. F.C.Khanna, I.S.Towner (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada).
AIP Conf. Proc. (USA), no.97, p.406 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).

Corrections to the off-diagonal Gamow-Teller (GT) transition matrix elements are calculated in a model similar to the one used (Towner and Khanna, 1979) to calculate the diagonal GT matrix elements. The residual interaction is approximated by a finite-range one-boson-exchange potential and a short-range correlation function is introduced. The calculation incorporates the effect of core polarisation (CP) to second order in perturbation theory, meson exchange currents (MEC) and isobar currents. Each of the MBB vertex (M is a meson and B is a nucleon or an isobar) has a monopole form factor. (1 ref.)

74911 Precise Q_β measurements for $A=91$ to 93 mass chains. R.Jafig-liola, M.Chatterjee, H.Dauter, J.K.P.Lee (Foster Radiation Lab., McGill Univ., Montreal, Quebec, Canada).

Can. J. Chem. (Canada), vol.61, no.4, p.694-6 (April 1983).
The Q_β values of $^{91-93}\text{Rb}$, $^{91-93}\text{Sr}$, and $^{92-93}\text{Y}$ were measured using mass-separated Rb sources obtained from an on line isotope separator. A ΔE -E

detector telescope consisting of a $300\text{ }\mu\text{m}\times 300\text{ mm}^2$ Si ΔE - and a $15\text{ mm}\times 500\text{ mm}^2$ Ge(HP) E detector was used. Results are in general agreement with recently published values but some discrepancies are indicated. (12 refs.)

74912 Identification of 26-minute Zr-84. S.Shibata, P.J.Karol (Dept. of Chem., Carnegie-Mellon Univ., Pittsburgh, PA, USA). *Can. J. Chem. (Canada)*, vol.61, no.4, p.754-6 (April 1983). An unknown γ -ray of energy 112.5 keV was found in zirconium fractions chemically extracted from isotopically enriched molybdenum targets bombarded with 500 and 800 MeV protons. All evidence suggests that the γ -ray is identifiable with the decay of ^{84}Zr to ^{84}Y . A half-life of $25.7\pm 0.5\text{ min}$ was obtained for ^{84}Zr , which is considerably longer than previously reported half-lives. The absolute abundance of the 112.5 keV γ -ray was also determined. Relative production cross sections for ^{84}Zr were calculated using these results and were consistent with the values interpolated from isotopic distribution curves for spallation reactions. (8 refs.)

74913 The decay of 56-s ^{148}Ce to levels of odd-odd ^{148}Pr . N.K.Aras, C.Chung, S.Faller, C.A.Stone, W.B.Walters (Dept. of Chem., Univ. of Maryland, College Park, MD, USA), R.L.Gill, M.Schmid, R.E.Chrien. *Can. J. Chem. (Canada)*, vol.61, no.4, p.780-5 (April 1983). The decay of ^{148}Ce to levels of ^{148}Pr has been studied using mass-separated sources. A half-life of $56\pm 1\text{ s}$ has been measured for the decay of ^{148}Ce . A level scheme containing 40 γ -rays and 15 excited levels is proposed for ^{148}Pr . Strongly β -fed 1^+ levels have been identified at 390 and 520 keV that are similar in position to 1^+ levels observed in isotonic ^{146}La and isotopic ^{146}Pr . (18 refs.)

74914 Study of inner bremsstrahlung accompanying non-unique second-forbidden β decay in ^{99}Tc . K.S.Gundu Rao, P.Venkataramiah, K.Gopala, H.Sanjeeviah (Dept. of Phys., Univ. of Mysore, Mysore, India). *J. Phys. G (GB)*, vol.9, no.6, p.691-5 (June 1983).

The inner bremsstrahlung spectrum accompanying non-unique second-forbidden β decay of ^{99}Tc has been measured in the energy region 50-280 keV using a $4.5\times 5.08\text{ cm}^2\text{NaI(Tl)}$ crystal scintillation spectrometer. The magnetic deflection method was employed to prevent β particles from the source reaching the detector. The measured spectrum was unfolded following the method of Liden and Starfelt (1954). The unfolded spectrum was compared with the theoretical distributions of Chang and Falkoff (1949), Lewis and Ford (1957) and Ford and Martin (1969). No agreement between theory and experiment is observed in any case. However, close proximity between experiment and the second-forbidden scalar theory of Chang and Falkoff exists in the energy region 50-150 keV. (19 refs.)

74915 ^{35}Na : a new neutron-rich sodium isotope. M.Langevin, C.Detraz, D.Guillemaud-Mueller (Inst. de Phys. Nucleaire, Orsay, France), A.C.Mueller, C.Thibault, F.Touchard, M.Epierre. *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.116-18 (26 May 1983). ^{35}Na produced by on-line isotope separation has been identified by the detection of β -delayed neutron emission. The measured half-life is $(1.5\pm 0.5)\text{ ms}$. (8 refs.)

74916 Effects of light and heavy Majorana neutrinos in neutrinoless double beta decay. A.Halprin, S.T.Petcov (Univ. of Delaware, Newark, DE, USA), S.P.Rosen.

Phys. Lett. B (Netherlands), vol.125B, no.4, p.335-8 (2 June 1983). The authors examine interference effects between the light neutrino and the heavy neutral lepton exchange amplitudes in neutrinoless double beta ($[\beta\beta]_0$) decay. Using the lower limit on the electron neutrino mass deduced from the tritium end point measurements and the most recent data on neutrinoless double beta decay of tellurium, they obtain an upper limit on the mass of the heavy neutral lepton of about 3 GeV. They also find that the effective Majorana mass parameter associated with the ($\beta\beta$)₀-decay exhibits a strong dependence on the parent nuclear species, and therefore searches for the ($\beta\beta$)₀-decay should be performed for several nuclei simultaneously and independently. (14 refs.)

74917 Electron capture decay of ^{237}Pu , ^{236}Np , and ^{236}Np . I.Ahmad, J.Hines, J.E.Gindler (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA). *Phys. Rev. C (USA)*, vol.27, no.5, p.2239-47 (May 1983). Decay schemes of $45.3\text{-d }^{237}\text{Pu}$ and $1.55\times 10^5\text{ yr }^{236}\text{Np}$ have been investigated by measuring their γ ray and conversion electron spectra with a $5\text{-cm}^2\times 1\text{-cm}$ Ge detector and a cooled Si(Li) spectrometer, respectively. Intensities of γ rays, X-rays, and conversion electrons have been determined and these have been used to derive $\log ft$ values for EC and β^- transitions. In addition to confirming previously known level schemes in ^{237}Pu and ^{236}Np , the energies of the $4^+ \rightarrow 2^+$ and $6^+ \rightarrow 4^+$ transitions in the ^{236}Pu ground state band have been determined. Relative intensities of X-rays in the decay of ^{236}Np have also been measured. (16 refs.)

74918 Electronic rearrangement on molecules accompanying β -decay investigated by nuclear resonance fluorescence. G.Kehlenbeck, J.Ahlert, F.Wolf, L.Ziegler, F.Smend, M.Schumacher (II. Physikalisches Inst., Univ. Göttingen, Göttingen, Germany).

Z. Phys. A (Germany), vol.311, no.4, p.253-7 (1983). Using gaseous ^{60}Co sources, the velocity distribution of ^{60}Ni nuclei after β -decay of ^{60}Co has been measured by the nuclear-resonance-fluorescence coincidence (NRF-C) method. By comparison with model calculations, information is obtained on the rearrangement of electrons on the molecule as a consequence of the change of nuclear charge. In 42% of the rearrangement processes bound (NiL_2^+) or (NiL^+) molecule ions are formed. In 24% the molecule is singly charged but with the bonds between Ni and its molecular partners ruptured. In 34% the charging of more than one molecular partner leads to Coulomb explosion of the molecule. The probability of finding more than one charge on the molecule is larger by a factor of 2 as compared to the probability for electron shake-off on an isolated Ni atom. (22 refs.)

23.60 ALPHA DECAY

74919 Surface alpha clustering. I.Rotter (Zentralinst. für Kernforschung, Rossendorf, Germany).

Phys. Rev. C (USA), vol.27, no.5, p.2261-8 (May 1983). The problem of alpha decay is discussed on the basis of a theory which describes discrete and continuous states in a unified manner. A formula for numerical calculations is given in which configurational mixing as well as channel coupling is taken into account. The R -matrix approximation is shown to be justified if the width is spread over a small number of decay channels. Generally, renormalization of the wave function is necessary if a factorization of the width is assumed. The importance of channel coupling for the case of a small reduced width is discussed. 24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

74920 Dirac phenomenology for nuclear reactions. J.R.Shepard (Univ. of Colorado, Boulder, CO, USA).

AIP Conf. Proc. (USA), no.97, p.288-98 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The application of Dirac phenomenology to nuclear reactions is discussed. The large vector and scalar potentials necessary to describe the nucleon-nucleon spin-orbit interaction are found to enhance the small components of nuclear wavefunctions. This is found to have a potentially large effect on some electron- and nucleon-induced inelastic scattering amplitudes. (15 refs.)

74921 Pion dynamics in the relativistic nuclear many-body problem. B.D.Serot (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

AIP Conf. Proc. (USA), no.97, p.337-48 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).

Pion interactions in the nuclear medium are studied using renormalizable relativistic quantum field theories. Previous studies using pseudoscalar πN coupling encountered difficulties due to the large strength of the πNN vertex. These difficulties may be avoided by formulating renormalizable field theories with pseudovector πN coupling using techniques introduced by Weinberg (1967, 1968, 1979) and Schwinger (1967). Calculations are performed for two specific models: the scalar-vector theory of Walecka (1974), extended to include π mesons in a non-chiral fashion, and the linear σ -model with an additional neutral vector meson. The pion propagator is evaluated in the one-nucleon-loop approximation, which corresponds to a relativistic random-phase approximation, which corresponds to a relativistic random-phase approximation built on the Hartree ground state. Virtual NN loops are included, and suitable renormalization techniques are employed. The local-density approximation is used to compare the threshold pion self-energy to the s -wave pion-nucleus optical potential. (18 refs.)

74922 Scattering length in a system of three charged particles. A.A.Kvitsinskii (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).

JETP Lett. (USA), vol.36, no.10, p.455-7 (20 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.10, p.375-7 (20 Nov. 1982). [received: June 1983] A modified definition is offered for the scattering length in a system of three charged particles. A correct method for calculating it is described. This method is used to calculate the scattering length for the scattering of the proton by the deuteron. (12 refs.)

74923 Structure-dependent corrections to the parameters of resonant states in light nuclei. T.Delbar, G.Gregoire (Inst. de Phys., Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium), B.Antolkovic, G.Paic.

Phys. Rev. C (USA), vol.27, no.5, p.1897-900 (May 1983). It is shown that the position and width of resonant levels, as deduced from experimental spectra, are dependent upon their structure. The corresponding corrections to get true positions and widths may be considerable for light nuclei. (3 refs.)

74924 Scattering with absorptive interaction: energy-dependent potentials. W.Cassing (Gesellschaft für Schwerionenforschung, Darmstadt, Germany), M.Stingl, A.Weiguny.

Phys. Rev. C (USA), vol.27, no.5, p.1901-12 (May 1983). The energy dependence and analytic structure of the effective interaction for elastic scattering of composite particles are investigated using Feshbach's projection technique. A generalized Levinson theorem is established for complex, nonlocal, and energy-dependent interactions. The analytical results are illustrated by means of Argand diagrams for a solvable model and the effect of energy averaging is discussed. (12 refs.)

74925 Graphical analyses of connected-kernel scattering equations. A.Picklesimer (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).

Phys. Rev. C (USA), vol.27, no.5, p.1927-31 (May 1983). Simple graphical techniques are employed to obtain a new (simultaneous) derivation of a large class of connected-kernel scattering equations. This class includes the Rosenberger (1965), Benze-Redish-Sloan (1972, 1973, 1974), and connected-kernel multiple scattering equations as well as a host of generalizations of these and other equations. The basic result is the application of graphical methods to the derivation of interaction-set equations. This yields a

new, simplified form for some members of the class and elucidates the general structural features of the entire class. (19 refs.)

74926 Multiple scattering in the Lee model. M.G.Fuda (Dept. of Phys. & Astron., State Univ. of New York, Amherst, NY, USA). *Phys. Rev. C (USA)*, vol.27, no.5, p.2168-72 (May 1983). It is shown that the amplitude for the scattering of a θ particle from an arbitrary number of fixed N particles in the Lee model can be obtained from Watson's multiple scattering theory if the elementary interaction is taken to be the full θ - N T matrix, including the V -particle pole, and the propagator is taken to be a free particle propagator. (10 refs.)

74927 Nonlocal potentials and their exact and approximate local and velocity-dependent equivalents. H.Fiedeldey, S.A.Sofianos (Phys. Dept., Univ. of S Africa, Pretoria, S Africa). *Z. Phys. A (Germany)*, vol.311, no.4, p.339-49 (1983). The authors show that good approximations to the exact equivalent local potential (ELP) and damping factor of a nonlocal Perey-Buck potential can be calculated in the partial wave WKB approximation of Horiuchi (1980). The exact ELP and damping factor are obtained by means of a method previously given by Fiedeldey (1966, 1967). They also confirm that an approximate ELP proposed by Bauhoff et al. (1980) is of comparable accuracy as the Horiuchi approximation. These l -dependent ELP's exhibit reduced attraction in the interior and provide a test for higher order WKB approximations. They subsequently obtain an equivalent velocity dependent potential (EVDP) which is even exactly wave function equivalent to the original nonlocal potential. This almost local potential, unlike the trivial equivalent local potential, is smooth and well-behaved and is therefore particularly useful in nuclear reactions where the off-shell behaviour of the potential is important. (30 refs.)

74928 Further evidence for 'extra push'. W.Westmeier, R.A.Esterlund, A.Rox, P.Patzelt (Inst. fuer Kernchem., Marburg, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.109. For massive heavy-ion systems, evidence has appeared which might be interpreted as a need for an extra inward radial velocity at contact for fusion to occur, a so-called 'extra push'. The amount of extra push is related to a parameter called the 'effective fissility' $(Z^2/A)_{\text{eff}}$, and systems with similar $(Z^2/A)_{\text{eff}}$ are expected to be dynamically equivalent. Hence, the systems $^{136}\text{Xe} + ^{208}\text{Pb}$ ($(Z^2/A)_{\text{eff}} = 32.3$) and $^{208}\text{Pb} + ^{48}\text{Ca}$ ($(Z^2/A)_{\text{eff}} = 31.9$) should exhibit equivalent amounts of extra push in their fusion excitation functions. Fusion model calculations based on this concept have been modified via scaling parameters fitted to experimental data, enabling one to calculate phenomenological fusion excitation functions for other heavy-ion reaction systems. The question remains open as to whether or not the scaling parameters derived from the data fits are universally valid as implied by the model. The authors present evidence favoring this thesis. (4 refs.)

74929 A microscopically determined diabatic potential for heavy-ion collisions. A.Lukasiak, W.Cassing, W.Norenberg (Gesellschaft fuer Schwerionenforschung, Darmstadt, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.123. Heavy-ion collisions in the energy range of a few MeV/n above the Coulomb barrier imply collective velocities \dot{q} which are small compared to the Fermi-velocity ($\dot{q} \ll V_F$) but too large to allow for a description within the static diabatic single-particle representation. Dynamically this means that close to quasi-crossings of the adiabatic levels the nucleon likes to jump to the higher unoccupied level preserving the nodal structure of the wavefunction (Landau-Zener transition probability ≈ 1). In this way the symmetries of the collective motion are restored in the Hamiltonian, i.e. the coupling matrix element given by twice the spacing of the adiabatic levels at the quasi-crossing is neglected. The diabatic s.p. basis approximately corresponds to a basis transformation in which quasi-crossings of adiabatic s.p. motion thus leads to the creation of particle-hole excitations whenever a diabatic level crosses the Fermi-energy. With respect to the collective motion this excitation mechanism gives rise to a conservative potential which partially decays in time due to residual two-body collisions. This energy V_{diab} which can be temporarily stored in the s.p. motion is calculated within the 'diabatic' two-center shell model as a function of various collective degrees of freedom. (3 refs.)

74930 The influence of symmetries and nonadiabatic couplings on the diabatic potential for two colliding heavy ions. A.Lukasiak, W.Cassing, W.Norenberg (Gesellschaft fuer Schwerionenforschung, Darmstadt, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.124. The concept of a diabatic s.p. representation $\{\phi_k\}$ (Zener 1932) is based on the assumption that the diabatic states smoothly follow changes of the nuclear mean field in contrast to adiabatic states which drastically change their structure in the vicinity of quasi-crossings. The symmetry properties and the nodal structure of these states therefore should be conserved. The radial nonadiabatic couplings $\langle \phi_k | -i\partial/\partial R | \phi_l \rangle$ describe the change of the diabatic states as a function of the collective coordinate and should be small for properly defined diabatic states. One way to achieve this is to assume maximum symmetry for the colliding system because the couplings vanish between states with different symmetries. The authors investigate this effect on the diabatic potential calculated within a representation (a) given by the symmetric two-center oscillator basis. In this case the parity, reflection through the collision plane, rotation and time reversal symmetries are conserved. For comparison also display the diabatic potential for an asymmetric system (b) where the parity and reflection symmetry is violated. The diabatic potential is significantly reduced in this case because the number of the nonadiabatic couplings have increased. (3 refs.)

74931 Scaling properties of hydrodynamical cross sections. N.Balazs, K.Dietrich, B.Schurmman (Phys. Dept., Tech. Univ. Munchen, Munchen, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.129. Since numerical hydrodynamical calculations have shown that viscosity has little influence on the results the authors restrict themselves to non-viscous isentropic flow. For simplicity they only discuss collisions of equal nuclei. (4 refs.)

74932 Pineuts: a possible explanation for anomalous. W.C.McHarris, J.O.Rasmussen (Nuclear Sci. Div., Lawrence Berkeley Lab., Berkeley, CA, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.130. A model that could explain the experimental properties of anomalous is the following: They could result from a nuclear halo of 'pineuts', hadronically bound states of a π^- and a few neutrons surrounding a nucleus. Although the s -wave π^-n interaction is repulsive, the p -wave is attractive. Thus, the possibility exists that neutron-rich nuclei (or nuclei with neutron-rich domains, such as the neck in a fissioning system) could have a sufficiently attractive velocity-dependent potential to allow π^-xn hadronically bound 'polynutron' systems. Relativistic heavy-ion collisions provide the best opportunity for forming such states, for it has been found that not only are π^- 's produced in copious quantities, but also they are Coulomb-focused near the same velocity as the projectile and target fragments, bathing the target in a localized, intense flux of π^- 's. Also, the excited nuclear fragments may likely have neutrons in barely-bound orbitals tailing out well beyond the normal nuclear radius. Whether or not free π^-xn clusters are bound, conditions are optimal for forming a nuclear stratospheric halo enriched in pineut clusters. (4 refs.)

74933 Classical limits of the multi-channel formalism via the Vlasov equation. M.J.Rhoades-Brown (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), R.Y.Cusson, P.-G.Reinhardt.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.135. The authors have compared exact quantum-mechanical coupled-channels calculations of very heavy-ion inelastic scattering reactions with a formalism based on classical dynamical equations of motion plus the quantum-mechanical superposition principle. These studies have prompted further investigation into the classical limits of the quantum-mechanical multi-channel formalism and the role played by complex effective interactions in this limit. With these ideas in mind, the Vlasov equation for the case of a non-Hermitian Hamiltonian has been obtained from the Wigner representation of the density matrix. Solving this Vlasov equation within the classical limit shows that the corresponding classical equations of motion are the ones for a real potential augmented by a new equation for the time-dependent probability that the classical particle remains in its ground state. Classical elastic and absorption cross sections have also been worked out. (3 refs.)

74934 Theory of heavy ion scattering on the basis of the two center shell model. D.Hahn, W.Scheid, J.Y.Park (Justus-Liebig-Universität, Giessen, Germany).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.136. A model for the scattering of light nuclei is presented which describes the intrinsic nuclear structure on the basis of the two-center shell model (TCSM). The coordinates of this model are the relative coordinate between the nuclei and single-particle coordinates of the nucleons, which are referred to the center of mass of a rotating coordinate system. The basis set of wave functions for the nucleons is taken from the two-center shell model. In deriving the coupled channel equations the nonlocal potential terms are approximated by Taylor expansion. This semi-microscopic theory is applicable and suitable for the study of collective molecular resonance structures in the cross sections of light heavy ion scattering (e.g. $^{12}\text{C} + ^{12}\text{C}$). (2 refs.)

74935 Pauli spinor representations for spin 3/2 operators. G.J.Grube, J.Y.Park (Dept. of Phys., North Carolina State Univ., Raleigh, NC, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.141. The authors present two types of representations for the spin 3/2 operators. The first representation has been constructed from Group Theoretic calculations. They present the second representations in the form of a generalized algorithm employing the Pauli spinors themselves, not just their elements. They are able to represent all orders of the 3/2 spin operators in terms of the Pauli spin 1/2 operators. Algorithms for the commutation and the anticommutation operators are also presented. (no refs.)

74936 Explicit representations of tensor spin orbit interactions for systems with maximum channel spin 3. G.J.Grube (Dept. of Phys., Illinois State Univ., Normal, IL, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.142. One of the many interesting effects which may occur in nucleus-nucleus interactions is the spin orbit interaction. If one accepts the present wisdom, then the spin is averaged over the nucleus. For spin effects to be more readily discernible it is required that A be small and spin be large. The deuteron has been used for a long while to investigate spin effects. The representation of the deuteron wave function, which is $\psi_d = c_s \psi_s + c_d \psi_d$ requires that the coefficient c_d for the d state contribution be small. In particular contributions from terms with c_d^2 are usually ignored in calculations. However, there are several other nuclei which possess spins larger than 1/2 and which have quadrupole moments. While nuclei such as ^7Li , ^{10}B , ^{14}N do not possess the small mass, they do have larger d state contributions than the deuteron. In particular, the contribution from terms which contain c_d^2 should not be ignored in calculations. The author therefore, investigated several orders of the tensor spin orbit interactions among some of the nuclei. (no refs.)

24.10H Optical and diffraction models

- 74937 Model study of intermediate state blocking in first-order optical potential theory. Khin Maung Maung, P.C.Tandy (Dept. of Phys., Kent State Univ., Kent, OH, USA). *AIP Conf. Proc. (USA)*, no.97, p.87 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Restrictions on the intermediate states allowed for nucleon-nucleon scattering operators embedded in many-nucleon systems can arise in several circumstances. The most familiar is Pauli blocking of the occupied ground-state levels in the nucleon-nucleon G-matrix for nuclear matter. The corresponding projection operator is $Q_{NM} = \theta(p_1 - k_F)\theta(p_2 - k_F)$. The first-order optical potential from Watson multiple scattering theory involves a nucleon-nucleon scattering operator in which intermediate states of the struck nucleon corresponding to the target ground state are projected out. The corresponding projection operator is $Q = 1 - |\phi_0\rangle\langle\phi_0|$ where $|\phi_0\rangle$ is the target ground state. A simple model of the free NN t-matrix is employed to study and compare the effects of intermediate-state modifications through both these operators. Particular attention is paid to the unitarity properties of the resulting modified NN scattering operator for first-order optical potentials. (no refs.)
- 74938 Physics limitations of the optical model. N.Austern (Univ. of Pittsburgh, Pittsburgh, PA, USA). *AIP Conf. Proc. (USA)*, no.97, p.115-20 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Aspects of optical potential theory are discussed. The author tries to approach the OP from its applications. (15 refs.)

- 74939 First order interpretation of optical potentials. L.Ray (Dept. of Phys., Univ. of Texas, Austin, TX, USA). *AIP Conf. Proc. (USA)*, no.97, p.121-42 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The theoretical understanding of intermediate energy proton-nucleus observables in terms of nucleon-nucleon phenomenology and nonrelativistic multiple scattering theory is discussed. Specifically, the ability of local, second order, spin-dependent Kerman, McManus and Thaler (1959) optical potential models to describe proton-nucleus elastic scattering data from 300-800 MeV is reviewed. Calculations which rely on impulse approximation are fairly successful at 800 MeV but fail significantly for energies less than 500 MeV. Evidence is presented which indicates that medium effects are quite important in modifying the true proton-nucleon effective interaction from that given by the impulse approximation throughout the intermediate energy range, even at 800 MeV. It is concluded that the trends of the intermediate energy optical potentials can be accounted for qualitatively in terms of non-relativistic multiple scattering theory and medium modified effective interactions. The Glauber model and Dirac phenomenological approaches are briefly discussed. (49 refs.)
- 74940 Separable representation of the nonlocality of optical model potentials. G.Rawitscher (Univ. of Connecticut, Storrs, CT, USA). *AIP Conf. Proc. (USA)*, no.97, p.150 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Summary form only given, as follows. The nonlocality which is due to the coupling of the elastic channel to nuclear excited states is usually written in terms of Green's functions and inelastic transition potentials. The Green's functions can in turn be expanded in a sum of separable terms if positive energy Weinberg states are used as discrete basis sets in all channels, and the resulting expansion for the nonlocal optical potential becomes separable. If in addition a projection onto the elastic channel Weinberg states is performed, then the number of terms in the separable expansion is reduced to a practical number. Applications to nucleon-nucleus scattering at intermediate energies are envisaged. (1 ref.)
- 74941 Dirac phenomenology and the nuclear optical model. B.C.Clark, S.Hama (Dept. of Phys., Ohio State Univ., Columbus, OH, USA), R.L.Mercer. *AIP Conf. Proc. (USA)*, no.97, p.260-87 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). A Dirac equation based optical model treatment of proton-nucleus scattering is discussed. Results obtained using a relativistic optical model consisting of Lorentz scalar and Lorentz four-vector components are given. The parameters in the model have been varied to obtain high quality fits to elastic differential cross section, analyzing power, and spin rotation function measurements. Features of these Dirac optical model potentials are compared with various theoretical relativistic calculations. (39 refs.)
- 74942 Diffraction scattering off strongly bound system. V.E.Kuzmichev (Phys. Inst., Univ. Bonn, Bonn, Germany). *Phys. Rev. C (USA)*, vol.27, no.5, p.2158-67 (May 1983). The scattering of a hadron on a strongly bound system of two hadrons (a dihadron) is considered in the high-energy limit for the relative hadron dihadron motion. The dihadron scatterer motion and the internal interaction are included in the author's consideration. It is shown that only small values of the internal transfer momentum of dihadron particles bring the principal contribution to the three-particle propagator in the eikonal approximation. On the basis of the exact analytical solution of the integral equation for the total Green's function the scattering amplitude is derived. It is shown that the scattering amplitude contains only single, double, and triple scattering terms. Three new terms to the Glauber formula for the total cross section are obtained. These terms decrease both the effective hadron-hadron cross section and the screening correction. (9 refs.)
- 74943 Selective transparency in the region of resonances. I.Rotter (Zentralinst. fur Kernforschung Rossendorf, Dresden, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.126. The selective transparency in the region of resonances is a non-statistical effect. It should be taken into account in the analysis of the data by an imaginary part of the optical potential which has a resonance-like dependence on energy at the position of resonances. (3 refs.)
- 74944 Mean free path of a nucleon in nucleus-nucleus collision. B.Sinha (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India). Proceedings of the International Conference on Nucleus-Nucleus Collision (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.131. The mean free path of a nucleon for two colliding nuclei has been calculated in terms of the imaginary part of the optical potential and the k effective mass. The nucleon belonging to a nucleus differs from the free nucleon in two substantial ways—the nucleon for colliding nuclei is dressed with internal Fermi motion and secondly, the Pauli blocking due to the occupied intrinsic states of the nuclei will tend to inhibit interaction between nucleons of the two nuclei unless the relative energy far exceeds the Fermi energy when Pauli blocking gets switched off. The internal motion energy of the nucleon is taken into account using a Fermi Gas model; Pauli blocking on the other hand is incorporated using a simple geometric model so that the distorted Fermi momentum is now expressed in terms of the undistorted momenta and the distortion factor F, the fractional volume of Fermi sphere which does not overlap with each other. An intrinsic 'temperature' dependence arising due to the diffuseness of the Fermi sphere is also taken into account. (2 refs.)

24.30 RESONANCE REACTIONS AND SCATTERING

74945 $\Delta(1236)$ -isobar degrees of freedom and the strength of spin-isospin resonances. J.Speth (Inst. fur Kernphys., KFA Julich, Julich, Germany). *AIP Conf. Proc. (USA)*, no.97, p.398-403 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The most interesting feature of the spin-isospin modes excited in charge-exchange reactions is the magnitude of the transition strength. In the case of the Gamow-Teller resonances (GTR) there exists a well established, model-independent, sum rule by Ikeda et al. (1961). So far only about 60% of this sum rule strength has been detected experimentally. Conventional nuclear structure effects seem to be unable to explain the 'missing' GT-strength. The Δ -isobar degrees of freedom play an important role in the quenching of the axial-vector coupling constant g_A . The author presents a consistent calculation of different experimental quantities in the 48 Ca-region which are all connected with the spin-isospin part of the particle-hole interaction. This part of the force is of crucial importance in connection with the 'quenching'. (9 refs.)

74946 Quasimolecular and cluster states of light nuclei as examples of intermediate structure. J.Cseh (Inst. of Nuclear Res., Hungarian Acad. of Sci., Debrecen, Hungary). *J. Phys. G (GB)*, vol.9, no.6, p.655-63 (June 1983). 4⁺, 6⁺ and 8⁺ resonances of the ¹²C+¹²C system, 5/2⁺ and 7/2⁺ cluster states of ¹⁹F and 0⁺ resonances from α scattering on ²⁴Mg and ²⁶Mg are analysed as intermediate structure data. Parameters of the underlying simple states and the couplings are deduced. (16 refs.)

74947 Application of the microscopic sp(3,R) model to the giant monopole and quadrupole resonances in ¹⁶O. M.G.Vassanji, D.J.Rowe (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.103-5 (26 May 1983). The microscopic sp(3,R) model is applied to the ground-state representation of ¹⁶O and the properties of the first few 0⁺ and 2⁺ states, including energies, RMS radii, and transition strengths, are calculated. The lowest excited 0⁺ and 2⁺ states are interpreted as giant resonances, the properties of the 2⁺ state are compared with experimental data in the resonance region. (11 refs.)

74948 The isoscalar quadrupole strength distribution above 10 MeV in ⁴⁰Ca. F.Zwarts, A.G.Drentje, M.N.Harakeh, A.van der Woude (Kernfysisch Versneller Inst., Groningen, Netherlands). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.123-7 (26 May 1983). From angular correlation measurements of α_0 decay to the ³⁶Ar ground state, the isoscalar E2 strength distribution between 10 and 16 MeV in ⁴⁰Ca has been found to be concentrated in the interval $E_x=12.5-15.5$ MeV and to exhaust about 12% of the EWSR in the α_0 channel and about (45⁺¹⁰₋₁₅)% if extrapolated to all channels. (22 refs.)

74949 Fluid dynamics of giant resonances of high spin states. M.di Nardo, M.di Toro, G.Giansiracusa, U.Lombardo, G.Russo (Istituto Dipartimentale di Fisica, Univ. di Catania, Catania, Italy). *Phys. Lett. B (Netherlands)*, vol.125B, no.4, p.240-4 (2 June 1983). The authors describe giant resonances built on high spin states along the yrast line as scaling solutions of a linearized Vlasov equation in a rotating frame obtained from a TDHF theory in phase space. For oblate cranked solutions they get a shift and a splitting of the isoscalar giant resonances in terms of the angular velocity. Results are shown for ⁴⁰Ca and ¹⁶⁸Er. The relative CM strengths are also calculated. (20 refs.)

24.50 DIRECT REACTIONS

74950 Coupling between low-lying nuclear states. M.Ichimura (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan). *AIP Conf. Proc. (USA)*, no.97, p.192-204 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Various treatments for nuclear direct reactions are briefly reviewed and some problems inherent to them are observed. Effects of coupling in deuteron breakup channels, discrete inelastic channels and rearrangement channels are discussed with the following examples: ⁵⁸Ni(d,p)⁵⁹Ni(p_{3/2}), ²⁴Mg(p,d)²³Mg(1/2⁺), and ²⁰⁸Pb(p,t)²⁰⁸Pb(3⁺). (40 refs.)

74951 Momentum transfer in the fragmentation of copper by 400-GeV protons. J.B.Cumming (Chem. Dept., Brookhaven Nat. Lab., Upton, NY, USA). *Can. J. Chem. (Canada)*, vol.61, no.4, p.697-700 (April 1983). Mean momenta transferred to products of the fragmentation of copper by 400-GeV protons have been determined by the thick-target thick-catcher technique. Comparison with data for incident protons and heavy ions indicates that the limiting fragmentation region has been reached and supports a simple relationship between momentum and energy transfers in peripheral reactions which had been proposed previously. (26 refs.)

74952 Heavy target fragment yields in the interaction of 28 GeV protons with ²³⁸U. B.V.Jacak, W.Loveland, D.J.Morrissey, P.L.McGaughey, G.T.Seborg (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Can. J. Chem. (Canada), vol.61, no.4, p.701-7 (April 1983). The yields of target fragments from the interaction of 28 GeV protons with ²³⁸U have been measured, with special attention being given to those fragments with 160≤A≤200. From the measured fragment yields, isobaric production cross sections were calculated. Significant yields ($\sigma(A)\sim 1-10$ mb) of heavy target fragments (160≤A≤210) were found. These fragments are believed to be the non-fissioning survivors from the population of highly excited residual nuclei produced in the initial p-nucleus collision. A pedagogical calculation of the fission-particle emission competition shows how the initial highly excited heavy nuclei could evaporate ~20-50 particles while surviving fission competition. (42 refs.)

74953 Coulomb forces in the three-body problem with application to direct nuclear reactions. A.Osman (Internat. Centre for Theoretical Phys., Trieste, Italy).

Int. J. Theor. Phys. (USA), vol.22, no.4, p.341-53 (April 1983). Faddeev equations are considered in the case of three charged particles interacting with both separable nuclear two-body interactions and also including Coulomb forces. Modified Faddeev equations with Coulomb Green's functions are introduced. The three-body amplitudes are given into pure Coulomb and distorted-Coulomb amplitudes. Introducing a decomposition in the angular momentum states, a set of three-body integral equations is obtained. The effect of pure Coulomb amplitudes is studied in direct nuclear reactions and found to give a large contribution to the cross sections. The three-body integral equations obtained are applied for direct nuclear reactions. The angular distributions for ¹²C(⁶Li,d)¹⁶O, ¹⁶O(⁶Li,d)²⁰Ne, and ¹²C(⁶Li, α)¹⁴N transfer reactions are calculated as well as for the ⁶Li elastic scattering on ¹²C. From the good agreement between the theoretically calculated and experimental data, better spectroscopic factors are extracted. The effect of including Coulomb forces in the three-body problem is found to improve the results by about 16.26%. (27 refs.)

24.60 STATISTICAL THEORY AND FLUCTUATIONS

74954 A numerical method for two-dimensional Fokker-Planck equation. Yang Ying-hui, Wu Xi-zhen, Peng Qing-quan (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).

Commun. Theor. Phys. (China), vol.1, no.4, p.507-13 (1982). A general method for solving the two-dimensional F-P equation numerically is presented which can be applied to the study of the fission processes of systems with any forms of potentials and any viscosity as well as other processes, such as heavy ion collisions. (5 refs.)

74955 Quantum approach to the nuclear collision process. P.Danielewicz (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.132. Contrary to common belief nuclear collisions cannot be described classically at hundreds MeV/nucleon beam energies. At the initial stage of a (200-800) MeV/nucleon collision, the mean time τ between successive NN collisions is of the order of $1/(n_0\sigma v)\approx(1.7-3.5)$ fm/c. The value of τ implies uncertainties of nucleon energies in subsequent collisions $\hbar/\tau\approx(55-115)$ MeV. The uncertainties are comparable with values of nucleon energies in the mid-rapidity frame. The author has examined the role of quantum dynamics in high-energy nuclear collisions. He carries out numerical calculations of collisions in an interpreting nuclear-matter model. The quantum dynamics has been compared to a classical Markovian dynamics given by the Boltzmann equation. In quantum calculations, methods of nonequilibrium Green's functions have been employed. (3 refs.)

74956 Statistical generation of complete events in energetic nuclear collisions. G.Fai, J.Randrup (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.133. While previous studies of medium and high-energy nuclear collisions were mostly focused on inclusive observables, recent improvements in instrumentation demand that nearly exclusive quantities be addressed. As a first step in this direction, the authors have developed a statistical model for complete multi-fragment events in energetic nuclear collisions. This model can provide a useful reference against which more refined models, as well as the bias introduced by specific detection systems, can be judged. (4 refs.)

74957 The 'Time-Dependent Hauser-Feshbach' equation for multi-step compound processes. K.W.McVoy, X.T.Tang (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.134. Although the exciton model of pre-compound reactions was proposed in 1966, full-scale analyses of the general 'multi-step compound' contribution to the

energy-averaged cross section have only been developed in recent years. These multi-doorway models assume the existence of (a) fine-structure levels which overlap, (b) a 'class' of doorway levels (e.g. $(n+1)$ -particle n -hole states) feeding them which (after 'spreading') overlap, (c) a class of broader doorways (e.g. n -particle, $(n-1)$ -hole states) feeding them which after spreading overlap, etc.—i.e. a hierarchy of doorway classes. Although these doorways are by definition not eigenstates of the full Hamiltonian, one of the important concepts to emerge from recent analyses is that of 'eigenclasses' σ , i.e. linear combinations of the doorway and fine-structure classes which diagonalize the matrix that couples the doorway classes and permit the multi-step compound cross section to be written as a sum of Hauser-Feshbach-type cross sections. (1 ref.)

25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

74958 Nuclear pion photoproduction: a theory and the $^{16}\text{O}(\gamma,\pi^+)^{16}\text{N}(\text{bound})$ example. R.A.Eramzhyan (Inst. of Nuclear Res., Acad. of Sci., Moscow, USSR), M.Gmitro, S.S.Kamalov, R.Mach. *J. Phys. G (GB)*, vol.9, no.6, p.605-19 (June 1983).

A momentum-space expression for the nuclear pion photoproduction amplitude has been obtained and suitable approximations for it have been developed. Such a formulation naturally includes all pion-momentum-dependent terms of the amplitude and allows for an easy simultaneous treatment of several effects such as nucleon Fermi motion, relativistic and gauge invariance of the pion-nucleus photoproduction amplitude and multiple rescattering of pions. They all make important contributions to the photoproduction cross section. The $^{16}\text{O}(\gamma,\pi^+)$ reaction leading to the bound states of ^{16}N is analysed as an example. (27 refs.)

74959 Implications of the experimental results on the photodisintegration of ^4He . J.R.Calarco (Dept. of Phys., Univ. of New Hampshire, Durham, NH, USA), B.L.Berman, T.W.Donnelly. *Phys. Rev. C (USA)*, vol.27, no.5, p.1866-75 (May 1983).

The photoproton and photoneutron cross sections for ^4He are evaluated in the light of several recent measurements, and are found to be substantially different in the energy region below 30 MeV. Because these cross sections are dominated by $\Delta S=0$, $\Delta T=1$ E1 transitions, this result implies strong isospin mixing in the four-nucleon system. Furthermore, since available continuum shell-model calculations including Coulomb effects predict only small differences in the photoproton and photoneutron cross sections except near threshold, this result suggests that a nonzero charge asymmetry is present in the nuclear force. (53 refs.)

74960 $^{13}\text{C}(\gamma,p)$ cross section. D.Zubonov, R.A.Sutton, M.N.Thompson (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia), J.W.Jury. *Phys. Rev. C (USA)*, vol.27, no.5, p.1957-60 (May 1983).

A high resolution measurement of the $^{13}\text{C}(\gamma,p)$ cross section is presented from threshold to 28 MeV. In combination with the known $^{13}\text{C}(\gamma,n)$ cross section an estimate of the total absorption cross section is obtained and compared with current theoretical predictions. An estimate of the distribution of the isospin components in the giant dipole resonance shows the isospin splitting and the relative T_- and T_+ strengths are in agreement with predictions. (31 refs.)

74961 Measurement of the photoneutron yield in the irradiation of heavy materials in closed shells. E.G.Golikov, G.M.Vasnin, Yu.A.Koyazin (S.M. Kirov, Ural Polytech. Inst., Sverdlovsk, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.682-4 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.19-21 (Sept. 1982).

In the inspection of the technological parameters in the production of fissionable materials and nuclear fuel waste, it is necessary to place these materials behind a shielding shell (pipeline, fuel element, container, etc.). Because of the favorable nuclear physical properties of heavy materials, radiation methods with external radiation sources, particularly the high-energy beams of bremsstrahlung from electron accelerators appear highly suitable for this type of inspection. An all-wave counter was used to examine the dependence of the integral neutron yield in the irradiation of specimens of ^{238}U and ^{235}U in a flux of bremsstrahlung of a betatron with a spectrum endpoint energy of up to 25 MeV and of a combined object in a mixture of ^{238}U and ^{235}U isotopes in steel containers with a varying wall thickness. (8 refs.)

74962 Experimental investigation of the reaction $^{12}\text{C}(\gamma, \pi^0)X$ in the photon energy range between threshold and 450 MeV. J.Arends, N.Floss, A.Hege-rath, B.Mecking, G.Noldeke, R.Stenz (Physikalisches Inst., Univ. Bonn, Bonn, Germany).

Z. Phys. A (Germany), vol.311, no.4, p.367-74 (1983). The photoproduction of neutral pions on ^{12}C has been investigated between threshold and 450 MeV photon energy using a tagged photon beam at the Bonn 500 MeV synchrotron and a large acceptance detector. The π^0 detector consists of cylindrical wire chambers covering a solid angle of nearly 4π . Using a scintillation counter as an active ^{12}C target an attempt was made to separate coherent and incoherent π^0 photoproduction. The measured total and differential cross sections are compared to corresponding theoretical calculations. (20 refs.)

Yields of the photofission products of ^{237}Np See Entry 75063

25.30 LEPTON-INDUCED REACTIONS AND SCATTERING

74963 Structure functions for the electrodisintegration of the deuteron at a momentum transfer of 1.8 GeV^2 . Yu.I.Titov, A.S.Esaulov, E.V.Inopin, R.V.Akhmerov, E.M.Smelov (Physicotech. Inst., Acad. of Sci., Ukrainian SSR).

JETP Lett. (USA), vol.36, no.7, p.321-4 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.262-5 (5 Oct. 1982). [received: May 1983]

Structure functions are found for the electrodisintegration of the deuteron near the threshold in the relativistic region with $q_{\text{max}}^2=1.8 \text{ GeV}^2$ and $\nu=0.5\text{--}0.65 \text{ GeV}$. (10 refs.)

Dirac phenomenology for nuclear reactions See Entry 74920

25.40 NUCLEON-INDUCED REACTIONS AND SCATTERING

(see also 28.20 Neutron physics)

74964 An analytic distorted wave approximation for intermediate energy proton scattering. F.di Marzio, K.Amos (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia).

Aust. J. Phys. (Australia), vol.36, no.2, p.135-53 (1983).

An analytic distorted wave approximation (ADWA) has been developed for use in analyses of intermediate energy inelastic proton scattering from nuclei. Applications are made to analyse 402 and 800 MeV data from the isoscalar and isovector 1^+ and 2^+ states in ^{12}C and to the 800 MeV data from the excitation of the $2^-(8.88 \text{ MeV})$ state in ^{16}O . Comparisons of predictions

made using different model two-nucleon t matrices and different models of nuclear structure are given. (13 refs.)

74965 Proton and neutron elastic scattering between 80 and 1000 MeV. P.Schwandt (Indiana Univ., Bloomington, IN, USA). *AIP Conf. Proc. (USA)*, no.97, p.89-109 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Reviews the available experimental data for nucleon-nucleus elastic scattering in the intermediate-energy regime (which, in nuclear physics, conventionally ranges from pion production threshold up to ~ 1 GeV; the author actually shows and discusses data for energies down to 80 MeV). The author discusses the description of these data in terms of conventional optical-model phenomenology, i.e. the 'standard' optical model based on Woods-Saxon potentials. The failures of the standard optical model and improvements of the phenomenology are described. (33 refs.)

74966 Anomaly in the optical potential for deformed nuclei. H.Sakaguchi, F.Ohtani, N.Nakamura, T.Noro, H.Sakamoto, H.Ogawa, T.Ichihara, M.Yoshi, S.Kobayashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *AIP Conf. Proc. (USA)*, no.97, p.143-7 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Elastic scattering of 65 MeV polarized protons from rare earth nuclei has been measured. The volume integral of the real central part of the optical potential (J_0) and the volume integral of the spin orbit part of the potential (J_{ls}) show anomalous behaviors for these deformed nuclei. (3 refs.)

74967 Microscopic analysis of proton elastic scattering in the range 80-200 MeV. F.S.Dietrich (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), F.Petrovich. *AIP Conf. Proc. (USA)*, no.97, p.148 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The authors have undertaken a systematic comparison of differential cross-section and analyzing-power data on ^{12}C , ^{28}Si , ^{40}Ca , ^{90}Zr , and ^{208}Pb at 80-200 MeV with calculations based on the single-step folding-model approach to the optical potential. In these calculations, proton densities have been inferred from electron scattering results, with neutron densities either the same as for protons (^{12}C , ^{28}Si , ^{40}Ca) or with a small neutron skin consistent with 800-MeV proton scattering results (^{90}Zr , ^{208}Pb). The effective two-body interactions that have been used are the Love-Franey t -matrix, a density-dependent interaction based on the Paris potential (calculated by von Geramb), and finally the Brieva-Rook density-dependent central interaction used with the spin-orbit part of the Love-Franey interaction. (no refs.)

74968 Momentum-space optical potential and elastic scattering calculations. D.H.Wolfe (Dept. of Phys., Kent State Univ., Kent, OH, USA), M.V.Hynes, A.Picklesimer, P.C.Tandy, R.M.Thaler. *AIP Conf. Proc. (USA)*, no.97, p.149 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Initial results are presented for proton-nucleus elastic scattering observables calculated with a newly developed microscopic momentum-space code. This is the first phase of a program to treat elastic and inelastic scattering consistently via an integral equation approach. A number of microscopic features which are often approximated or ignored are quite amenable to exact treatment within this approach, e.g. nonlocal effects in elastic scattering, and inelastic effects which are nonlinear in the NN t -matrix and target densities but nevertheless confined to one participating nucleon. (3 refs.)

74969 A theory for proton-He scattering. M.J.Paez, R.H.Landau (Dept. of Phys., Oregon State Univ., Corvallis, OR, USA). *AIP Conf. Proc. (USA)*, no.97, p.151 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The elastic scattering of proton from ^3He and ^4He is calculated with a microscopic momentum space optical potential. The theory is unique in its inclusion of the full structure of spin $1/2 \times 1/2$ scattering. It is equivalent to a co-ordinate space potential with central, spin-orbit and several tensor terms each described as non-local, and velocity dependent. Also included are nucleon recoil and binding, antisymmetrized NN amplitudes, a Lorentz invariant angle transformation (no small angle approximation), and realistic form factors for the matter and spin distributions of nucleons within the nucleus. (3 refs.)

74970 Proton scattering to collective states: what we learn about the effective interaction in the nuclear medium. J.J.Kelly (Dept. of Phys., MIT, Cambridge, MA, USA). *AIP Conf. Proc. (USA)*, no.97, p.153-75 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Electron scattering measurements of the normal parity isoscalar 'collective' excitations of $N=Z$ nuclei completely specify the nuclear structure information required for the analysis of complementary proton scattering experiments. The analysis of the proton scattering data is then interpreted as a study of the medium modifications of the two-nucleon effective interaction. It has been found that the isoscalar spin-independent central component of the effective interaction is strongly dependent upon density and is well described by the local density approximation based upon nuclear matter effective interactions. The results are sensitive to the difference between effective interactions based upon the Hamada-Johnston and Paris potentials, and favor an intermediate interaction. The qualitative features of the medium corrections can be adequately represented by a few physically motivated parameters, which can be chosen so as to reproduce either the Hamada-Johnston or Paris results. (20 refs.)

74971 Inelastic proton scattering to one-particle one-hole states. C.Olmer (Indiana Univ., Bloomington, IN, USA). *AIP Conf. Proc. (USA)*, no.97, p.176-9 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The study of intermediate-energy proton inelastic scattering to one-particle one-hole states has attracted considerable attention over the last few years. One primary purpose of these studies has been to exploit the structural simplicity of these excited states as a possible means of separating effects due to nuclear structure and those due to the reaction mechanism. The author concentrates on one particular area of investigation, namely the energy dependence of proton inelastic scattering. The author discusses the excitation of three high-spin, particle-hole states in ^{28}Si : the 5^- , $T=0$ state at 9.70 MeV, the 6^- , $T=0$ state at 11.58 MeV and the 5^- , $T=1$ state at 14.35 MeV. These states have been studied at proton energies between 65 MeV and 800 MeV. (17 refs.)

74972 Microscopic analysis of ^6Li (\bar{p},p) and $^6\text{Li}(\bar{p},p')$ (2.18 MeV) analyzing powers at 25, 35, and 45 MeV. C.H.Pope, F.S.Dietrich, D.Rowley (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), H.E.Conzett, D.Eversheim, C.Rioux. *AIP Conf. Proc. (USA)*, no.97, p.226 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). In the limit of the plane-wave Born approximation, analyzing powers for proton inelastic scattering result from interference between the central and spin-orbit parts of the effective nucleon-nucleon interaction. Because the real part of the effective spin-orbit interaction is generally much greater than its imaginary part, one expects that the analyzing powers should exhibit a sensitivity to the imaginary part of the effective central interaction. The presence of distortion in the entrance and exit channels modifies this conclusion somewhat, however for certain specific transitions this sensitivity is still maintained. To test this hypothesis the authors have measured analyzing powers for proton scattering to the ground state (1^+ ; $T=0$) and first excited state (3^+ ; $T=0$) of ^6Li at incident energies of 25, 35 and 45 MeV using the polarized beam of the LBL 88 in cyclotron. Agreement between the analyzing power data and the calculations is not very good for either the ground or first excited state, indicating some serious deficiency in the model. Possible improvements are discussed. (2 refs.)

74973 Test of microscopic theory with data for simple transitions in the $^{90}\text{Zr}(\bar{p},p')$ and $^{89}\text{Y}(\bar{p},p')$ reactions. A.Scott, W.G.Love (Univ. of Georgia, Athens, GA, USA), H.V.von Geramb. *AIP Conf. Proc. (USA)*, no.97, p.227 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Proton transition densities for simple (p,p') transitions in these nuclei have been 'calibrated' with (e,e') scattering results and two recent density-dependent (DD) N-N forces ($G1$ and $G4$) used in different types of microscopic calculations at 159.5 MeV. The 8^+ state in ^{90}Zr is a pure proton state and the 6^+ state is dominantly of the same configuration, so proton amplitudes were calculated with a $g_{9/2}^2$ density and Woods-Saxon potential agreeing with electron scattering; first with exact exchange and then using a pseudo potential for exchange amplitudes. The computed asymmetries (A_y) had small differences; both calculations are better fits to data than with a free N-N force, but fits are still not fully satisfactory. Other calculations (ALN), with direct input of (e,e') densities and a pseudo potential for exchange, produce A_y shapes differing from the exact calculations at larger angles. Similar ALN calculations for the 2_1^+ and 4_1^+ states in ^{90}Zr and simple transitions in ^{89}Y yield the same conclusion. (2 refs.)

74974 Energy dependence of the ratio of isovector effective interaction strengths $[J_{\pi\pi}/J_{\pi}]$ from 0° (p,n) cross sections. T.N.Taddeucci (Ohio Univ., Athens, OH, USA). *AIP Conf. Proc. (USA)*, no.97, p.228-31 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). Ratios of 0° (p,n) cross sections indicate that the spin-flip to non-spin-flip interaction strength ratio $[J_{\pi\pi}/J_{\pi}]$ is approximately linear and target-mass independent for energies between 50 MeV and 200 MeV. To within a distortion-dependent factor of order unity, this latter ratio is well represented by $R(E_p) = E_p/(55.0 \pm 1.0 \text{ MeV})$. (6 refs.)

74975 Quasi-elastic scattering of polarised protons at 300 MeV. P.Kitching, P.W.Green, C.A.Miller, D.A.Hutchison, A.N.James, W.J.McDonald, K.Michaelian, G.C.Nelson, W.C.Olsen, D.M.Sheppard, J.Soukup, G.M.Stinson, I.J.van Heerden (TRIUMF, Univ. of Alberta, Edmonton, Alberta, Canada). *AIP Conf. Proc. (USA)*, no.97, p.232 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The authors' earlier measurements (1981) of the $^{40}\text{Ca}(\bar{p},2p)$ reaction at 200 MeV incident energy have been extended to 300 MeV using the TRIUMF polarised proton beam. Values of cross section and analysing powers for the knockout of protons for $1d_{3/2}$, $2s_{1/2}$ and $1d_{5/2}$ shells in ^{40}Ca are obtained and are compared to DWIA calculations incorporating spin orbit terms in the optical potentials, and also to calculations using optical potentials are derived from a relativistic approach based on the Dirac equation. The expected j -dependence of the analysing power is seen. The analyzing powers measured in the geometry where the angles of out going protons are very unequal are consistent with a value of zero for the two body polarization parameter, P , while its value is expected to be ~ 0.2 . Measurements for scattering from the $2s_{1/2}$ protons, which measure the value of P directly show no such effect. (1 ref.)

74976 A pragmatic approach to the continuum spectrum in the quasifree scattering. G.Ciungaru (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA). *AIP Conf. Proc. (USA)*, no.97, p.250-3 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). An expression for the continuum background in the quasifree scattering is given as the convolution of a number of rescattering steps of the quasifree particles on the residual nucleus. It is assumed that the rescattering probability can be expressed in terms of the inelastic scattering cross section of the quasifree particles. Comparison with the $^{58}\text{Ni}(p,2p)^{57}\text{Co}$ data at $E_0=198$ MeV supports the model prediction. (6 refs.)

74977 A global study of the $p+^{27}\text{Al}$ reaction at 180 MeV. S.-H.Zhou, K.Kwiatkowski, T.E.Ward, V.E.Viola, Jr. (Indiana Univ., Bloomington, IN, USA), H.Breuer, A.Gokmen, A.C.Mignerey, G.J.Mathews. *AIP Conf. Proc. (USA)*, no.97, p.254-9 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). A global study of the mass, energy and angular distributions of all products formed in collisions of 180-MeV protons with ^{27}Al is reported. These data are compared with semiempirical and intranuclear-cascade-plus-evaporation calculations, as well as data from recent fission-fragment angular correlation studies with intermediate-energy light-ions incident on heavy target nuclei. It is found that there is substantial evidence for enhanced energy deposition in nucleon-nucleus collisions relative to the predictions of the intranuclear cascade calculation. (13 refs.)

74978 The Schrodinger equivalent complex potential and the Dirac phenomenology. M.Jaminon (Inst. de Phys., Univ. de Liege, Liege, Belgium). *AIP Conf. Proc. (USA)*, no.97, p.324-8 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The author shows that the phenomenological analyses of nucleon-nucleus elastic scattering data using a single-particle Dirac equation are not affected by the inclusion of a complex nuclear field that behaves like the space-like components of a vector. (7 refs.)

- 74979 Future prospects in N-nucleus interactions.** J.M. Moss (Los Alamos Nat. Lab., Los Alamos, NM, USA). *AIP Conf. Proc. (USA)*, no. 97, p.414-23 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982). The author examines in detail two research areas, polarization observables and antiproton-nucleus reactions, which should have near-term future impact on the understanding of the interaction of medium-energy nucleons in nuclei. More speculative future experiments employing cooled beams, double spectrometer systems, and large Q-value low momentum-transfer reactions are also discussed. (25 refs.)
- 74980 Nuclear mean free paths and transparency at intermediate energies.** P.J. Karol (Dept. of Chem., Carnegie-Mellon Univ., Pittsburgh, PA, USA). *Can. J. Chem. (Canada)*, vol. 61, no. 4, p.750-3 (April 1983). The soft-spheres model of nuclear reaction cross sections incorporating tapered density distributions is used to evaluate nucleon mean free paths and transparencies at intermediate energies. Comparison with similar calculations employing uniform density distributions shows the latter to give misleading results that nevertheless have been used in recent years as evidence that the physics of the nucleon-nucleon interaction within nuclei is incompletely understood. (19 refs.)
- 74981 Particle distribution around a copper beam stop for 72 MeV protons.** T.A. Broome, D.R. Perry, G.B. Stapleton (Rutherford Appleton Lab., Chilton, England), D. Duc. *Health Phys. (GB)*, vol. 44, no. 5, p.487-99 (May 1983). Results are presented of a nuclear reaction cross sections incorporating tapered density distributions is used to evaluate nucleon mean free paths and transparencies at intermediate energies. Comparison with similar calculations employing uniform density distributions shows the latter to give misleading results that nevertheless have been used in recent years as evidence that the physics of the nucleon-nucleon interaction within nuclei is incompletely understood. (19 refs.)
- 74982 Mechanisms for the enhancement of P- and T-invariant effects in neutron-nucleus reactions.** V.E. Bunakov, V.P. Gudkov (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., USSR). *JETP Lett. (USA)*, vol. 36, no. 7, p.328-30 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol. 36, no. 7, p.268-70 (5 Oct. 1982). [received: May 1983] It is possible that T- and P-invariance effects are enhanced in the scattering of slow neutrons by compound nuclei. (7 refs.)
- 74983 Measurement of cumulative-neutron and cumulative-proton spectra in 1-GeV proton-nucleus interactions.** V.N. Baturin, V.V. Vikhrov, M.M. Makarov, V.V. Nelyubin, A.A. Naberezhnov, V.V. Sulimov, L.N. Uvarov (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., USSR). *JETP Lett. (USA)*, vol. 36, no. 10, p.448-51 (20 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol. 36, no. 10, p.370-2 (20 Nov. 1982). [received: June 1983] A comparative study has been made of the spectra of cumulative neutrons and protons produced at an angle of 114° in collisions of 1-GeV protons with ^9Be and ^{12}C nuclei. The slope parameters of the inclusive neutron spectra are similar to those of the proton spectra. (6 refs.)
- 74984 Low-energy n-p capture as a probe of two-nucleon dynamics.** J.M. Greben (Phys. Dept., Univ. of Alberta, Edmonton, Alberta, Canada), R.M. Woloshyn. *J. Phys. G (GB)*, vol. 9, no. 6, p.643-54 (June 1983). The authors examine the sensitivity of the cross section and polarisation observables in radiative neutron-proton capture to the uncertainty in the two-nucleon potential at short and intermediate range. These uncertainties are modelled by unitary phase-equivalent transformations of the Hamiltonian. They find that the photon linear polarisation is very sensitive to the resulting changes in the wavefunctions. The neutron analysing power is rather insensitive to these changes and could play a role in identifying effects not included in a potential model description. (30 refs.)
- 74985 1 GeV $P-^{40}\text{Ca}$ elastic scattering.** Lu Jifeng (Guangxi Teachers Training Coll., Xining, China), Liu Yuan, Wang Rulin. *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol. 28, no. 1, p.30-3 (Jan. 1983). [received: June 1983] 1 GeV proton elastic scattering on ^{40}Ca has been investigated by the optical limit approximation, and the nucleon-nucleon and alpha-nucleus amplitudes calculated. The results are discussed and compared with experimental data. (8 refs.)
- 74986 Parity violation and related effects in neutron-induced reactions.** V.E. Bunakov, V.P. Gudkov (Leningrad Inst. of Nuclear Phys., Gatchina, Leningrad, USSR). *Nucl. Phys. A (Netherlands)*, vol. A401, no. 1, p.93-116 (30 May 1983). The multi-channel multi-level nuclear reaction theory is used to give a general approach to various parity-violation effects observable in neutron-induced reactions on complex nuclei. The energy dependence and various enhancement factors of these effects are discussed and compared with experimental data on thermal and resonance neutrons. Special attention is paid to neutron-induced fission and to the information provided by these experiments. (48 refs.)
- 74987 Dirac-equation impulse approximation for intermediate-energy nucleon-nucleus scattering.** B.C. Clark, S. Hama (Dept. of Phys., Ohio State Univ., Columbus, OH, USA), R.L. Mercer, L. Ray, B.D. Serot. *Phys. Rev. Lett. (USA)*, vol. 50, no. 21, p.1644-7 (23 May 1983). In this application of Dirac phenomenology a relativistic impulse approximation is used to describe proton-nucleus elastic scattering at intermediate energies. The results demonstrate the superiority of this relativistic treatment over the nonrelativistic impulse approximation, especially with regard to spin observables. The method has important implications with respect to the extraction of neutron distributions. (16 refs.)
- 74988 Energy deposition in intermediate-energy nucleon-nucleus collisions.** K. Kwiatkowski, S.H. Zhou, T.E. Ward, V.E. Viola, Jr. (Dept. of Chem., Indiana Univ., Bloomington, IN, USA), H. Breuer, G.J. Mathews, A. Gokmen, A.C. Mignerey. *Phys. Rev. Lett. (USA)*, vol. 50, no. 21, p.1648-51 (23 May 1983). A global study of the mass, energy, and angular distributions of all products formed in collisions of 180-MeV protons with ^{27}Al is reported. These data are compared with calculations based on intranuclear-cascade-plus-evaporation, preequilibrium hybrid, and semiempirical models. It is found that there is evidence for enhanced energy deposition in nucleon-nucleus collisions relative to predictions of intranuclear cascade calculations. In contrast, preequilibrium calculations produce stronger energy damping, more consistent with observed data. (14 refs.)
- 74989 Antiproton-nucleus interaction at low energy.** T. Suzuki, H. Narumi (Dept. of Phys., Hiroshima Univ., Hiroshima, Japan). *Phys. Lett. B (Netherlands)*, vol. 125B, no. 4, p.251-4 (2 June 1983). On the basis of the Brueckner-Hartree-Fock theory, the self-energy of an antiproton in nuclear matter is evaluated with the static Bryan-Phillips (1968) potential, and the density-dependent effective NN interaction is estimated with this self-energy. Using the p-nucleus optical potential constructed by folding this effective NN interaction, one can predict the complex level shift of p-atoms. (12 refs.)
- 74990 Calculation of the energy-averaged scattering function for high resolution low-energy neutron scattering data.** C.H. Johnson, N.M. Larson (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), C. Mahaux, R.R. Winters. *Phys. Rev. C (USA)*, vol. 27, no. 5, p.1913-26 (May 1983). The elastic scattering neutron cross section at low energy displays many narrow resonances. By definition, the optical-model scattering function is equal to a suitable energy average of the actual scattering function. This average should be independent of the particular representation chosen for parametrizing the actual scattering function and also fairly independent of the averaging weight function. In particular, it should be fairly independent of the width of the weight function, even though a sparsity of resonances might require the width to be comparable to the energy range of the measurements. It is shown by direct numerical calculations of the average that this holds in the example of the scattering of $p_{3/2}$ neutrons by ^{32}S . Attention is drawn to pitfalls which exist when this average is evaluated analytically from parametrized forms of the scattering function. Several ways of graphically representing or parametrizing the average scattering function are illustrated and discussed. (11 refs.)
- 74991 Microscopic formalism for intermediate energy transfer reactions: application to the (p,d) and (d,p) reactions.** L.D. Lukeking (Phys. Dept., Indiana Univ., Bloomington, IN, USA), J.P. Vary. *Phys. Rev. C (USA)*, vol. 27, no. 5, p.1967-87 (May 1983). Using a multiple scattering framework the authors construct a variant of the usual distorted-wave Born approximation transition matrix for stripping and pickup reactions. An alternative to the local energy approximation is derived which in the appropriate limit gives the commonly used zero range approximation for (p,d) and (d,p) reactions. Model calculations are developed in an eikonal framework and an examination of the sensitivity and energy dependence of the nuclear response function is made, using the $^{12}\text{C}(p,d)^{11}\text{C}(3/2^-)$ g.s.) process. (48 refs.)
- 74992 Deformation effect in the fast neutron total cross section of aligned ^{59}Co .** U. Fasoli, P. Pavan, D. Toniolo, G. Zago, R. Zannoni (Istituto di Fisica, Univ. degli Studi, Padova, Italy), G. Galeazzi. *Phys. Rev. C (USA)*, vol. 27, no. 5, p.2003-11 (May 1983). The variation of the total neutron cross section, $\Delta\sigma_{\text{align}}$, on ^{59}Co due to nuclear alignment of the target has been measured over the energy range from 0.8 to 20 MeV employing a cobalt single crystal with a 34% nuclear alignment. The results show that $\Delta\sigma_{\text{align}}$ oscillates from a minimum of -5% at about 2.5 MeV to a maximum of +1% at about 10 MeV. The data were successfully fitted by optical model coupled-channel calculations. The coupling terms were deduced from a model representing the ^{59}Co nucleus as a vibrational ^{60}Ni core coupled to a proton hole in a $(1/2_1^+)$ shell, without free parameters. The optical model parameters were determined by fitting the total cross section, which was independently measured. The theoretical calculations show that, at lower energies, $\Delta\sigma_{\text{align}}$ depends appreciably on the coupling with the low-lying levels. (47 refs.)
- 74993 Neutron-nucleus spin-spin interaction in the low MeV range.** W. Heeringa (Inst. fur Kernphys. und Teilchenphys., Kernforschungszentrum Karlsruhe, Karlsruhe, Germany), H. Postma. *Phys. Rev. C (USA)*, vol. 27, no. 5, p.2012-18 (May 1983). An attempt is made to find a satisfactory explanation for the average spin-spin cross section of ^{59}Co for neutrons between 0.3 and 2.9 MeV. Calculations with an optical model spin-spin potential obviously fail to reproduce these data. A hybrid model is developed containing elements of compound-nucleus formation and of the optical model. Partial waves with orbital momenta up to $l=4$ are taken into account: This model yields a good explanation of the ^{59}Co data. It also agrees with the spin-spin cross section of ^{16}O , the only other nucleus for which data exist above 0.1 MeV. (34 refs.)
- 74994 Enhanced backward emission of heavy fragments in high-energy proton-nucleus collisions.** J. Hufner (Inst. fur Theoretische Phys., Univ. Heidelberg, Heidelberg, Germany), H.M. Sommermann. *Phys. Rev. C (USA)*, vol. 27, no. 5, p.2090-5 (May 1983). The conventional description of high energy proton-nucleus collisions in terms of an intranuclear cascade and compound nuclear decay (the two-step model) breaks down at projectile energies $E_p > 10$ GeV. Unusual backward enhancements are found in the angular distribution of heavy fragments (Sc, Cu) from uranium targets. This effect is explained in a fast breakup model of deep spallation/cleavage processes. The observed backward emission originates in the competition between (backward-directed) Coulomb repulsion and (forward-directed) momentum components from recoiling nucleons. (10 refs.)
- 74995 Analysis of threshold (p,π^0) reactions.** D.A. Jenkins, M. Madden (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA). *Phys. Rev. C (USA)*, vol. 27, no. 5, p.2096-103 (May 1983). A procedure is derived for analyzing (p,π^0) reactions near threshold where pions are present in only s- and p-wave states. The pions, which decay into two gammas, have an angular distribution in the center of mass which can be correlated to the angular distribution of its decay gammas in the laboratory. Functions are calculated which give the laboratory distribution of both gammas in terms of parameters describing the angular distribution of pions in the center of mass. By fitting these functions to the observed gamma distribution, the pion differential cross section is determined. (6 refs.)
- 74996 Impulse approximation NN amplitudes for proton-nucleus interactions.** J.A. McNeil (Dept. of Phys., Villanova Univ., Villanova, PA, USA), L. Ray, S.J. Wallace. *Phys. Rev. C (USA)*, vol. 27, no. 5, p.2123-32 (May 1983). Transformation of nucleon-nucleon amplitudes from the center of mass frame to the proton-nucleus Breit frame are developed for use in multiple scattering analyses. As a byproduct, a matrix equation is given for the invariant NN amplitudes in Dirac spinor representation. Based on recent NN phase shifts, Gaussian parametrization of the pp and np amplitudes are calculated and some proton-nucleus calculations are presented to illustrate the effects of the Breit frame amplitudes. For ^{40}Ca , these effects are quite small. (13 refs.)
- 74997 800 MeV protons as probes of neutron transition densities.** L. Ray, G.W. Hoffmann (Dept. of Phys., Univ. of Texas, Austin, TX, USA). *Phys. Rev. C (USA)*, vol. 27, no. 5, p.2133-42 (May 1983). Angular distribution data for 800 MeV $^{208}\text{Pb}(p,p')$ (2.61 MeV, 3^-) are analyzed to determine the sensitivity of the analysis to the neutron component of the transition density. The analysis employs the first order Kerman, McManus, and Thaler (1959) optical potential model (distorted wave Born approximation together with the impulse approximation). The total error in the multipole moment of the deduced transition density, $M_n(E3)$, is computed based on uncertainties in (1) the elastic and inelastic scattering data, (2) the geometry of the transition density, (3) the nucleon-nucleon amplitudes, (4) the proton transition density, (5) correlation corrections, and (6) medium modifications to the effective interactions. Under the presumption of an accu-

rate theoretical model, the minimal uncertainty in $M_n(E3)$ is $\pm 8.5\%$. Such accuracy permits meaningful comparisons with results from nuclear structure theory. (32 refs.)

74998 Proton isotonic density differences from 0.8 GeV proton-nucleus elastic scattering. L.Ray, G.W.Hoffmann (Dept. of Phys., Univ. of Texas, Austin, TX, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2143-9 (May 1983).

Elastic differential cross sections and analyzing powers for 800 MeV $p+^{48}\text{Ca}$ and ^{54}Fe are analyzed to obtain the isotonic proton density difference. The calculations employ a local, spin-dependent, second order Kerman, McManus, and Thaler (1959) optical potential model; care is given to isovector, spin-unsaturated subshell, and phenomenological nuclear medium corrections. The results obtained here are compared with those from electron scattering experiments and theoretical expectations. The results of this analysis provide an overall consistency check on corresponding studies which start with known charge densities and determine neutron isotopic density differences. (28 refs.)

74999 Measurements of analyzing power for $^2\text{H}(\bar{n},n)^2\text{H}$ scattering at 14.1 MeV and comparisons to $^2\text{H}(\bar{p},p)^2\text{H}$. W.Tornow (Phys. Inst., Univ. Tübingen, Tübingen, Germany), R.C.Byrd, C.R.Howell, R.S.Pedroni, R.L.Walter.

Phys. Rev. C (USA), vol.27, no.5, p.2439-42 (May 1983).

Data for the analyzing power $A_y(\theta)$ for the elastic scattering of neutrons from deuterons have been measured at 14.1 MeV for the range from 30° to 153° (c.m.) to accuracies between ± 0.003 and ± 0.006 . The results are compared to previous n -d data at 14 MeV and are in significant disagreement with the most recent measurement. The present data are in excellent agreement with a Faddeev calculation by Doleschall (1982). The data are also very similar to p -d scattering data at 14.1 MeV, although systematic deviations are observed at forward angles and near the maximum of $A_y(\theta)$ at 130° . Recent calculations indicate that Coulomb effects can explain most of these differences, although some features will require further investigation. (11 refs.)

75000 Double differential cross sections for (p, xn) reactions of ^{64}Zn , ^{65}Cu and ^{89}Y with 26 MeV protons. W.Scobel, L.F.Hansen, B.A.Pohl, C.Wong, M.Blann (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

Z. Phys. A (Germany), vol.311, no.4, p.323-8 (1983).

Double differential cross sections for the inclusive production of neutrons from ^{64}Zn , ^{65}Cu and ^{89}Y bombarded with 26.0 MeV protons have been measured with time-of-flight techniques. The data reduction is discussed with respect to the influence of background corrections in the continuous part of the spectra, and a short comparison with preequilibrium model calculations is presented, showing good agreement with predictions of both, the hybrid and the geometry-dependent hybrid model including multiple particle emission. The question of how to treat pairing remains open. (19 refs.)

75001 Measurement of the average neutrons yield from 250 MeV protons absorbed in a lead target. Yu.V.Ryabov, G.K.Matushko, V.N.Slastnikov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR).

Z. Phys. A (Germany), vol.311, no.4, p.363-5 (1983).

Neutron yield from 250 MeV protons accelerated by the ITEPh synchrotron is measured in a lead target 5 cm diameter and 10 cm long. The observed total yield is 2.56 ± 0.27 neutrons/proton, where the evaporation and cascade components are 2.30 ± 0.25 and 0.26 ± 0.11 neutrons/protons respectively. (12 refs.)

75002 Production of large P_T particles in p-nucleus and nucleus-nucleus collisions at high energies. D.S.Narayan (Tata Inst. of Fundamental Res., Bombay, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.57

Summary form only given. Recent results from ISR on the production of large P_T particles in p - α and α - α collisions and similar earlier results from Fermilab in P -nucleus collisions present a complex pattern. The results of these experiments are explained on the basis of the coherent tube model which implies collective interactions inside the nucleus.

75003 Polarization transfer in $\text{A}(\bar{d},\bar{p})\text{X}$ reactions. H.Sakamoto, M.Nakamura, H.Sakaguchi, H.Ogawa, S.Kobayashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan), N.Matsuoka, K.Hatanaka, T.Noro, S.Kato.

AIP Conf. Proc. (USA), no.97, p.424 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).

Summary form only given, as follows. Transverse polarization transfer coefficients (k_y') have been measured in the reactions ^{12}C , ^{58}Ni , $^{208}\text{Pb}(\bar{d},\bar{p})\text{X}$. The experiment was performed at RCNP AVF cyclotron laboratory using a 56 MeV vector-polarized deuteron beam. Emitted protons leaving the residuals in their continuum states were selected by Q-magnet pairs according to their momenta and were focused on the analyzer targets (Si-SSD) in the Si-Ge polarimeters located at 13.5° and 20.0° laboratory angles. The energy bins of the measured protons have been chosen to be 22, 26, 31 and 36 ± 2 MeV. (no refs.)

75004 Complete set of first-order polarization observables in nucleon-deuteron elastic scattering near 20 MeV deuteron energy. M.Sawada, S.Seki, K.Furuno, Y.Tagishi, Y.Nagashima, J.Schimizu, M.Ishikawa, T.Sugiyama, L.S.Chuang, W.Gruebler, J.Sanada (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), Y.Koike, Y.Taniguchi.

Phys. Rev. C (USA), vol.27, no.5, p.1932-8 (May 1983).

The authors have measured differential cross section and analyzing powers A_y , iT_{11} , T_{20} , T_{21} , and T_{22} for proton-deuteron elastic scattering near 20 MeV deuteron energy. The total error of the differential cross section was 1% or less. Each deuteron analyzing power was measured independently with the maximum efficiency. The total error of the analyzing power was less than 0.007. Faddeev calculations have been performed for three cases of nucleon-nucleon interaction. None of them gives an overall quantitative fit to the measured values. The effect of the Coulomb interaction is discussed. (23 refs.)

25.60 ^3He - AND ^4He -INDUCED REACTIONS AND SCATTERING

75005 $^{45}\text{Sc}(\alpha,\alpha')^{44}\text{Sc}^{m+g}$: a monitor reaction for alpha particle induced reactions. P.A.Beeley, J.Aaronson, K.Kokkas, J.J.Hogan (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada).

Can. J. Chem. (Canada), vol.61, no.4, p.641-5 (April 1983).

The excitation function for the $^{45}\text{Sc}(\alpha,\alpha')^{44}\text{Sc}^{m+g}$ reactions have been measured at beam energies from 20 to 90 MeV. These provide a beam monitor for alpha particle induced reaction studies. The excitation functions and isomer ratios are discussed with particular reference to an apparent error in the decay scheme of $^{44}\text{Sc}^m$. (19 refs.)

75006 Fragmentation spectra induced by light ions colliding with light nuclei. T.Delbar, G.Gregoire, P.Belery (Inst. de Phys., Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium), G.Paic.

Phys. Rev. C (USA), vol.27, no.5, p.1876-86 (May 1983).

Inclusive energy spectra of light charged particles from the $^6\text{Li}+^3\text{He}$, $^9\text{Be}+p$, and $^9\text{Be}+^3\text{He}$ reactions have been measured using beams of 30 to 75 MeV. The continuum parts have been studied in the framework of phase space calculations. The influence of other reaction mechanisms, such as final state interactions, sequential processes, and quasifree reactions is evaluated. The authors deduce the nontrivial angular dependence of the various phase spaces. (22 refs.)

75007 Separation of direct and compound nuclear contributions in inelastic α scattering. H.Ortner, W.Eyrich, A.Hofmann, U.Scheib (Phys. Inst., Univ. Erlangen-Nürnberg, Erlangen, Germany).

Phys. Rev. C (USA), vol.27, no.5, p.1988-92 (May 1983).

A method for separating direct and compound nuclear reaction contributions to inelastic α scattering on spin 0 targets is proposed. It is based on the characteristic behaviour of the parameters of the α - γ angular correlation function in a distorted-wave Born approximation and a Hauser-Feshbach model treatment. The method is applied to the reaction $^{28}\text{Si}(\alpha,\alpha')\gamma$. (16 refs.)

75008 Phase shift analysis of alpha-particle elastic-scattering angular distributions on the ^{40}Ca target nucleus. M.C.Mermaz (Dept. de Phys. Nucleaire, CENS, Gif-sur-Yvette, France).

Phys. Rev. C (USA), vol.27, no.5, p.2019-28 (May 1983).

A phase shift analysis of 15 alpha particle elastic scattering angular distributions measured accurately between 30° and 170° center of mass and between 26.13 and 47 MeV by the Basel group has been performed. Perfect agreement between experimental and the calculated differential cross sections is obtained over the full range of energy. The fluctuating behavior of the scattering matrix elements can possibly be explained by the presence of an intermediate-structure resonance phenomenon with contributions from many overlapping resonances. (26 refs.)

25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

- 75009** Elastic scattering of heavy ions and the compressibility of nuclear matter. K.A.Gridnev (NIIF, Leningrad State Univ., Leningrad, USSR), E.F.Hefter, K.Mikulas, V.M.Semjonov, V.B.Subbotin. *Aust. J. Phys. (Australia)*, vol.36, no.2, p.155-61 (1983). Analogies to hydrodynamics led recently to the derivation of a nonlinear Schrödinger equation for the elastic scattering of heavy ions (Delion et al., 1978). The numerical solution of this equation is shown to yield realistic values for the nuclear compressibility modulus $K=9C$, with very small uncertainties. (10 refs.)
- 75010** Fusion cross sections for $^{14}\text{N}+^{11}\text{B}$ at low energies. B.Dasmahapatra, B.Cujec, F.Lahlou (Dept. de Phys., Univ. Laval, Quebec, Canada). *Can. J. Phys. (Canada)*, vol.61, no.5, p.657-63 (May 1983). Fusion cross sections for the $^{14}\text{N}+^{11}\text{B}$ system have been measured from $E_{\text{cm}}=2.85$ to 8.53 MeV by the total γ -ray yield method. At energies just below the Coulomb barrier an enhancement similar to that present in the $^{12}\text{C}+^{12}\text{C}$ system, but less prominent, has been observed. A comparison of various ^{14}N -induced reactions shows that this enhancement is most prominent with an even-even target ($^{12}\text{C}, ^{16}\text{O}$), quite clear with an odd-even target (^{11}B), and almost disappears with an odd-odd target ($^{10}\text{B}, ^{14}\text{N}$). (13 refs.)
- 75011** Average transverse momenta of pions produced in nucleus-nucleus interactions at $p=4.5$ GeV/c per nucleon. M.Kh.Anikina, G.L.Vardenga, M.Gazdzitskii, A.I.Golokhvastov, T.D.Dzhobava, E.S.Kuznetsova, Yu.Lukstyn'sh, N.N.Nurgozhin, E.O.Okonov, T.G.Ostanevich, Yu.S.Pol', B.S.Suleimenov, G.G.Taran, S.A.Khorozov, E.K.Khusainov (Joint Inst. for Nuclear Res., USSR). *JETP Lett. (USA)*, vol.36, no.7, p.331-3 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.270-2 (5 Oct. 1982). [received: May 1983]
- Analysis of $\langle p_{\perp} \rangle$ for the negative pions produced in the interactions $^4\text{He}+^6\text{Li}$, $\text{C}+\text{Al}$, $\text{Cu}+\text{Pb}$, $^{12}\text{C}+\text{C}$, $\text{Ne}+\text{Cu}$, and $^{20}\text{Ne}+\text{Ne}$ at projectile-nucleus momentum per nucleon of 4.5 GeV/c shows that $\langle p_{\perp} \rangle$ does not depend on the centrality of the interaction, on the mass of the projectile nucleus in the interval $A_p=4-20$, or on the mass of the target nucleus in the interval $A_T=6-64$. The values found for $\langle p_{\perp} \rangle$ are at odds with calculations from a thermodynamic model. (5 refs.)
- 75012** Heavy-ion elastic scattering and its connections with fusion and absorption processes. A.Scalia (Istituto Dipartimentale di Fisica, Univ. di Catania, Catania, Italy). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.4, p.129-34 (28 May 1983). A simple expression for the heavy-ion elastic-scattering amplitude is presented. It reproduces the experimental values of the ratio of elastic scattering to Rutherford cross-sections and is suitable for a definition of the angles at which absorption and diffusion begin. The fusion and total reaction cross-sections are deduced from experimental elastic-scattering data. (6 refs.)
- 75013** Correlations between the alpha particles and ejectiles in the 208 MeV ^{14}N on ^{93}Nb reaction at three different ejectile angles. T.Fukuda (Dept. of Phys., Osaka Univ., Osaka, Japan), M.Ishihara, M.Tanaka, H.Ogata, I.Miura, M.Inoue, T.Shimoda, K.Katori, S.Nakayama. *Phys. Rev. C (USA)*, vol.27, no.5, p.2029-36 (May 1983). The in plane correlations between alpha particles and various ejectiles were investigated in the reaction of 208 MeV ^{14}N on ^{93}Nb at $\theta_{\text{H}}=+22^\circ$, $+50^\circ$, and $+80^\circ$. There were three sources of coincident alpha particles: (i) the sequential alpha decay of the excited ejectiles, (ii) the equilibrium alpha emission from the targetlike fragments, and (iii) the nonequilibrium process. Process (i) contributed mainly to the cross sections with the angular range of θ_{e} close to θ_{H} . Process (ii) contributed to the lowest part of the alpha energy spectra irrespectively of θ_{H} and θ_{e} . The remaining part was ascribed to process (iii). For this process the differential coincidence cross section of the lower energy part of the alpha particles was approximately factorized as $d^2\sigma/d\Omega_{\text{H}}d\Omega_{\text{e}}dE_{\text{H}}dE_{\text{e}}=K(d^2\sigma/d\Omega_{\text{H}}dE_{\text{H}})_{\text{single}}(d^2\sigma/d\Omega_{\text{e}}dE_{\text{e}})_{\text{single}}$ with $K\sim 0.4/b$, whereas the higher energy part of the alpha particles emitted at the forward angles had a tendency to coincide weakly with the ejectiles emitted at the backward angles ($\theta_{\text{H}}=+50^\circ$ and $+80^\circ$) as compared to the lower energy part of the alpha particles. (10 refs.)
- 75014** Baryon rapidity distribution and stopping power of high-energy colliding nuclei. J.Kapusta (School of Phys. & Astron., Univ. of Minnesota, Minneapolis, MN, USA). *Phys. Rev. C (USA)*, vol.27, no.5, p.2037-41 (May 1983). A very simple estimate is made of the baryon rapidity distribution to be expected from central collisions of high energy nuclei. This estimate is based upon straight-line trajectories and some average rapidity loss per nuclear-nucleon collision. It is found that U+U will become transparent at a beam energy of about 500 GeV/nucleon, or $15+15$ GeV/nucleon. (12 refs.)
- 75015** Orbiting phenomenon in $^{16}\text{O}, ^{28}\text{Si}$ scattering. C.S.Shastry (Groupe de Phys. Nucleaire Theorique, CRN, Strasbourg, France), I.Parjia. *Phys. Rev. C (USA)*, vol.27, no.5, p.2042-57 (May 1983). From an analysis of the effective potentials and the surface region behavior of quantum mechanical radial wave functions, the authors find that the most interesting physical phenomena taking place in $^{16}\text{O}+^{28}\text{Si}$ scattering at $E_{\text{lab}}=55$ MeV is the orbiting mechanism for $\ell=24, 25, 26$. They find that the orbital amplitude $A_0(\theta)$ generated by these partial waves acts coherently at large angles with the background amplitude $A_b(\theta)$ describing the remainder of the full amplitude. The enhanced large angle oscillations are caused by the almost, but not complete, destructive interference between $A_0(\theta)$ and $A_b(\theta)$. Using appropriate mathematical techniques, they show that at large angles $\theta\leq 180^\circ$, both $A_0(\theta)$ and $A_b(\theta)$ are dominated essentially by the same Legendre

polynomial. This explains the observation of Takemasa and Tamura (1978) that the cross sections generated by exact Regge pole terms behave quite similarly to that generated by the corresponding Regge background terms. Furthermore, their analysis clarifies the underlying reason for the success of the purely parametric Regge pole model at large angles. They also compare the infinite sequence of Regge poles generated by the barrier term in the Wentzel-Kramers-Brillouin formula for the 'nuclear' S matrix and the exact quantum mechanical orbiting Regge pole. The oscillatory behavior of the reflection function η_l of the $^{16}\text{O}+^{28}\text{Si}$ system at $E_{\text{lab}}=55$ MeV as a function of l for l below the orbiting regions is also explained. (13 refs.)

75016 Nuclear collisions of uranium nuclei up to ~ 1 GeV/nucleon. E.M.Friedlander, H.H.Heckman, Y.J.Karant (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2436-8 (May 1983).

The authors report observations of inelastic interactions of uranium nuclei with energies up to ~ 1 GeV/nucleon in nuclear emulsions exposed on the occasion of the first successful acceleration of relativistic uranium ions. About one-half of the interactions lead to binary fission. With increasing primary energy, the relative frequency of violent nuclear interactions increases at the expense of binary fissions. Also reported is a range measurement of uranium nuclei in emulsion at 0.945 GeV/nucleon. (6 refs.)

75017 Measurement of kinetic flow parameters for relativistic collisions of Ne on NaF and Ar on Pb_3O_4 . D.Beavis, S.Y.Chu, S.Y.Fung, W.Gorn, A.Huie, D.Keane, J.J.Lu, R.T.Poe, B.C.Shen, G.VanDalen (Dept. of Phys., Univ. of California, Riverside, CA, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2443-6 (May 1983).

The authors present kinetic flow parameters based on charged particle exclusive streamer chamber data for Ne on NaF at bombarding energies of 0.425 GeV/nucleon and 0.577 GeV/nucleon, and for Ar on Pb_3O_4 at 0.4 GeV/nucleon. Flow angles and aspect ratios are determined as functions of charged track multiplicity. The experimental findings are compared with predictions based on the intranuclear cascade model of Cugnon et al. (11 refs.)

75018 Study of spin polarization of residual nuclei in heavy ion reactions by γ -ray circular polarization measurement. K.Ikei.

Rep. Inst. Phys. & Chem. Res. (Japan), vol.59, no.1-2, p.20-47 (1983). In Japanese.

Fast light particles are emitted strongly at the forward direction in heavy ion reactions. To study the reaction mechanism of the phenomena, the authors measured circular polarization of coincident γ -rays emitted from the residual nucleus and deduced spin polarization. The experiments were performed using ^7Li and ^{14}N beams from the RIKEN cyclotron. The spin polarization for the $(^7\text{Li}, \alpha)$ reaction depends on α -particle energy and can be well explained as a recoil effect in the triton transfer process. The spin polarization for the $(^{14}\text{N}, \alpha)$ reaction, that also depends on α -particle energy, can be explained as a competition of massive-transfer process and deep-inelastic process. (41 refs.)

75019 Elastic scattering of ^{20}Ne on ^{24}Mg . W.J.Naude (Dept. of Phys., Univ. of Stellenbosch, Stellenbosch, S. Africa), H.S.Bradlow, O.Dietzsch, A.A.Pilt, W.D.M.Rae, D.Sinclair.

Z. Phys. A (Germany), vol.311, no.4, p.297-302 (1983).

Elastic scattering of ^{20}Ne on ^{24}Mg was studied at an incident ^{20}Ne energy of 40 MeV. Scattered ^{20}Ne and ^{24}Mg nuclei were observed in coincidence with a standard surface barrier and a position sensitive detector. The measured angular distribution shows periodic oscillations which are identified with the $^{24}\text{Mg}(^{20}\text{Ne}, ^{24}\text{Mg})^{20}\text{Ne}$ reaction. Taking interference between elastic scattering and transfer into account, an α -spectroscopic factor of $S=0.08\pm 0.02$ was deduced from the amplitude of the oscillations. (19 refs.)

75020 Energy dependence of the production of pions, kaons and antikaons calculated in the hydrochemical model. H.W.Barz (Zentralinst. für Kernforschung, Rossendorf, Germany), T.S.Biro, B.Lukacs, J.Zimanyi.

Z. Phys. A (Germany), vol.311, no.4, p.311-15 (1983).

Cross sections for the production of pions, kaons and antikaons in heavy ion reactions are calculated in the framework of the hydrochemical model. For the reaction Ne on NaF satisfactory agreement to the measured data is reached in a wide range of energies. The importance of consecutive hadron-hadron collisions for the mass dependence is shown. (23 refs.)

75021 Resonances in heavy-ion nuclear reactions. T.M.Cormier (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).

In book: *Annual review of nuclear and particle science*. Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Eds.], p.271-308. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

With the advent of tandem electrostatic accelerators in the early 1960s, nuclear physicists began the exploration of nuclear properties under extreme conditions of shape, angular momentum, temperature, density, and N/Z with heavy-ion reactions. This exploration continues today with ever-increasing vigor. The author examines some of the new and unexpected aspects of the nuclear structure of light nuclei that have been revealed in this exploration. He is primarily concerned with a new class of nuclear eigenstates observed experimentally in heavy-ion resonance reactions. These states are now known to exist in nuclei ranging from the s-d shell through the $f_{7/2}$ shell and are characterized by unexpectedly large partial decay widths for decay into fragments of comparable mass. These fission-like decays are usually taken as evidence for extreme deformations, and the term 'nuclear molecular state' has become almost universal in the literature. It should be pointed out, however, that the terminology, although universally accepted, implies more than is actually known about these states. (46 refs.)

75022 A phenomenological formula for fusion cross section. R.Giordano, F.Porto, S.Sambataro, A.Scalia (Istituto di Fisica, Univ. di Catania, Catania, Italy).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.101. The authors report on an empirical formula which reproduces the gross energy dependence for several heavy-ion systems and for different energy regimes. (2 refs.)

75023 Universal parametrization of fusion barrier. S.M.Lee, T.Nakagawa, W.Galster (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.103. The authors report on the unique parametrization of the heavy-ion fusion barrier $V_0(R_0)$ which is essentially universal and applicable for a wide mass range. Generally heavy-ion fusion cross sections at low energy are determined as follows: $\sigma_{\text{fus}}=\pi R_0^2(1-V_0(R_0)/E_{\text{cm}})$. By comparing experimental σ_{fus} with this equation one can determine R_0^{exp} and $V_0(R_0)^{\text{exp}}$ for a given system. The problem is, however, how to predict these quantities theoretically. Although many models have been proposed, usually based on the liquid drop model, none of them are really successful throughout a wide mass range covering from Light-Light to Heavy-Heavy systems. In order to evaluate

$V_B(r) = V_{Coul}(r) + V_N(r)$ at $r = R_B$, the authors choose the Woods-Saxon form for $V_N(r)$ in replacing R_1 range parameter, by R_B : $V_N(r) = V_0(1 + \exp((r - R_B)/a))^{-1}$. It should be noted that this potential gives the same value of $V_N(R_B)$ as another set of parameters of Woods-Saxon potential does, simply because of the 1 σ ambiguity. From the condition of $\partial V_B(r)/\partial r|_{r=R_B} = 0$, one finally gets $V_B(R_B) = Z_1 Z_2 e^2 (1 - 2a/R_B)/R_B$ where the following parameters are used: $R_B = R_1 + R_2 + \Delta R$, $R_1 = 1.12 A_1^{1/3} = 0.86 A_1^{-1/3}$, $1) \Delta R = 2.4$ fm and $a = 8.0/(A_1^{1/3} + A_2^{1/3})$ fm, the only empirically determined parameter. (1 ref.)

75024 A new critical distance model for heavy-ion fusion reactions. T.Matsuse, A.Arima (Dept. of Phys., Univ. of Tokyo, Bunkyo-ku, Japan), S.M.Lee.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.104

The rapid descent of the fusion cross section for lighter heavy-ion systems at higher energies (Region III) is interpreted in terms of a Fusion-Entry-Line based on a new concept of the critical distance between heavy ions. Taking into account the effect of Pauli exclusion principle between A_1 and A_2 , the critical distance $\sqrt{\langle d^2 \rangle}$ is expressed simply by using the mean square radius $\langle r^2 \rangle_A$. (1 ref.)

75025 Fusion-entry-line in fusion reactions for $^{12}C + ^{50}Cr$ and $^{32}S + ^{36}Si$. Y.Nagashima, S.M.Lee, T.Nakagawa, Y.Fukuchi, Y.Yokota, J.Schimizu, K.Furuno, T.Mikumo, N.X.Dai, T.Motobayashi, M.Yamanouchi (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.105

In spite of a great success of the Statistical-Yrast-Line Model to predict heavy-ion fusion cross sections for system $A < 80$ at higher energy, there is no good experimental data available up to now in which nearly symmetric- and very asymmetric systems, forming the same compound nucleus. The authors have chosen ^{62}Zn compound nucleus through two different entrance channels $^{32}S + ^{30}Si$ and $^{12}C + ^{50}Cr$ to study the former and the latter systems, respectively. (2 refs.)

75026 Incomplete fusion and nonequilibrium emission processes in the system $^{16}O + ^{93}Nb$ at 208 MeV. C.F.Maguire (Dept. of Phys. & Astron., Vanderbilt Univ., Nashville, TN, USA), R.L.Ferguson, B.Cheynis, I.-Y.Lee, R.Novotny, F.E.Obenshain, D.Pelte, F.Plasil, R.L.Robinson, G.R.Young.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.106

The authors have measured fusion-evaporation residue products from $^{16}O + ^{93}Nb$ reactions at 208 MeV incident energy both in singles and in coincidence with light-ions. Striking anomalies exist in the data relative to what is predicted assuming only complete fusion-evaporation occurs. The fusion singles experimental cross section at forward angles is a factor of two below that predicted by the code PACE. At larger angles the value is still several mb/sr while the predicted yield vanishes. To resolve this discrepancy they consider incomplete fusion in which deep-inelastic particle transfer scatters a highly excited target-like product in the forward quadrant where it is indistinguishable from an evaporation residue. (3 refs.)

75027 Incomplete fusion at low impact parameters with a ^{116}Sn target. C.Gerschel, N.Perrin, H.Tricoire, L.Valentin (Inst. de Phys. Nucleaire, Orsay, France).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.107

Gamma multiplicity measurements for given reaction channels following direct α particle emission confirm the low impact parameters observed with Sn targets in inclusive measurements. Mean γ multiplicities and variances σ of the Ω_γ distributions have been determined by the $P(x)$ method. On a ^{116}Sn target with 125 MeV ^{16}O projectiles the authors have measured $M_\gamma = 12 \pm 1$ and $\sigma = 6 \pm 1$ for the α 4n incomplete fusion channel. (Evaporation contribution is subtracted). They deduce $l_i/l_\alpha = 0.48$ where l_i is the entrance channel mean angular momentum and l_α the critical value for complete fusion. This low value is in agreement with other measurements on spherical targets and is lower than what is found with rare earth targets. (2 refs.)

75028 Dynamical theory of incomplete fusion reactions. T.Udagawa, T.Tamura (Dept. of Phys., Univ. of Texas, Austin, TX, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.108

It is now well known that energetic light particles such as p, d, t and α are emitted copiously in reactions induced by heavy ions. An important feature there is that these emission processes are almost always accompanied by the fusion of the rest of the incident ion into the target nucleus. These processes have thus been called the massive transfer or incomplete fusion reactions. The authors have proposed a theory to describe such reactions as a two-step process involving a direct breakup as the first step, followed by the fusion of one of the breakup pair with the target nucleus (breakup-fusion process). (4 refs.)

75029 Experimental signatures for fast fission. B.B.Back, R.R.Betts, K.Cassidy, B.G.Glagola, J.E.Gindler, L.E.Glendenin, B.D.Wilkins (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.110

The extra push model of Swiatecki (1982) has been very successful in explaining the limitations for heavy ion fusion in terms of the dynamics of the reaction. One consequence of this model is the prediction of 'fast fission' reactions. These occur when the system is temporarily caught behind the conditional saddle, but reseparates again after a substantial mass transfer has taken place. If the time scale for mass equilibration is shorter than the reaction time, one may find that the emerging fragments are indistinguishable from true fission fragments in terms of mass, charge and kinetic energy. (2 refs.)

75030 Dissipative collisions with a fission-like exit channel in the $^{132}Xe + ^{56}Fe$ system. D.Bangert, F.Busch, B.Kohlmeier, F.Puhlhofer (Fachbereich Phys., Philipps-Univ. Marburg, Marburg, Germany), B.Heusch, K.D.Hildenbrand, W.F.W.Schneider, D.Schull.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.111

Using the ^{132}Xe -beam of the GSI-Unilac angular distributions of the reaction products have been measured by means of a ΔE -E ionization chamber at bombarding energies of 5, 5.7 and 8.5 MeV/u. At all incident energies fully relaxed fragments centered at $(Z + Z_f)/2 = 40$, are observed. These Z-distributions are symmetric and their width is independent of the scattering angle. The angular distribution for each element is consistent with an

1/sin θ -dependence. Very forward of the grazing angle, conventional deep inelastic processes are observed, too, they are clearly separated from symmetric fragments and represent a minor part of the total reaction cross section, at least for the lower bombarding energies. (3 refs.)

75031 Angular dependence of symmetric fragmentation for the $^{32}S + ^{59}Co$ reaction. G.Guillaume, A.Fahli, F.Rami, J.P.Coffin, P.Engelstein, B.Heusch, P.Wagner, P.Fintz, J.Richert (Univ. Louis Pasteur, Strasbourg, France).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.112

Attention has been devoted to the study of fission-like fragmentation for systems of mass around 100. This mechanism has been examined with respect to its dependence on the mass of the system, the energy and the angular momentum brought in. The results indicate that it proceeds partly through a timescale intermediate mechanism between true fission (compound nucleus formation) and deep inelastic collisions. Further investigation has been undertaken on the $^{32}S + ^{59}Co$ reaction which exhibits a different behavior (double peaked at projectile and target masses) for the $\sigma_{\text{fission}}/\sigma_{\text{total}}$ mass distribution that the one characterizing heavier systems like $^{32}S + ^{140}Ge$ (single peak at half mass of the compound nucleus). The experiment was conducted at the 16 MV-MP Tandem of Strasbourg by bombarding a $150 \mu\text{g}/\text{cm}^2$ ^{59}Co target with ^{32}S ions at laboratory incident energies equal to 128, 143, 158, 178 and 198 MeV. The fragments were identified with time of flight techniques. (4 refs.)

75032 Fission of Pb nuclei at high angular momenta. D.J.Hinde, J.O.Newton, J.R.Leigh, R.J.Charity (Dept. of Nuclear Phys., Australia Nat. Univ., Canberra, Australia).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.115

The surface asymmetry parameter K_s of the liquid drop model describing the dependence of the surface energy on neutron excess is important in determining the macroscopic part of fission barriers original 1.78 up to 3.0. By measuring fission probabilities for a series of nuclei with fixed Z and different N, information on the value of K_s may be gained. Fission and evaporation residue excitation functions have been measured after the nuclei $^{192,195,198,200}Pb$ were formed in the fusion of $^{28,30}Si$ with $^{164,167,170}Er$. The fission probabilities extracted were fitted using the rotation liquid drop/statistical model codes ORNL ALICE and MBII. (6 refs.)

75033 Fast Fourier component in fusion reactions with heavy ions. M.F.Rivet, B.Borderie, D.Gardes, H.Gauvin, F.Hanappe, J.Peter, B.Tamain, A.Zaric, Z.Zheng (Inst. de Phys. Nucleaire, Orsay, France).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.116

Recently some experimental observations and theoretical predictions suggested the existence of Fast Fission, an interaction mechanism intermediate between compound nucleus formation and deep inelastic collisions. Experimentally, the occurrence of Fast Fission was supported by two facts: the maximum l-value contribution to fusion l_{fus} can be substantially larger than the l-value for which the fission barrier vanishes $l_{\text{BG}} = 0$; the symmetric component mass distribution markedly broadens when $l_{\text{fus}} > l_{\text{BG}} = 0$. However, this broadening could be attributed to a lowering at high angular momenta of the mass asymmetry stiffness parameter rather than to the occurrence of a new mechanism. In order to rule out one of these hypothesis, the authors investigated the Ar+U system ($l_{\text{BG}} \approx 10h$) and compared it with the Ar+Bi and Ar+Au systems ($l_{\text{BG}} \approx 45$ to $70h$). Binary events mass distributions have been obtained using time of flight. Preliminary results are shown presenting the evolution of the FWHM of the symmetric component mass distribution as a function of the incident laboratory energy. As expected from earlier observations in the Ar+Ho system the FWHM for Ar+Au and Ar+Bi systems increases drastically when increasing the energy. Conversely for the Ar+U system, at the barrier, the FWHM has already reached a large value and no drastic evolution is seen as a function of the incident energy (and angular momentum). These observations emphasize the role played by the angular momentum dependent fission barrier and confirm the existence of the fast fission mechanism. (4 refs.)

75034 Enhanced fission probabilities observed in the $^{184}W + ^{184}W$ collision. G.Rudolf, J.C.Adloff, M.Dakowski, D.Disdier, A.Gobbi, U.Lyden, W.Muller, A.Olmi, V.Rauch, H.Sann, F.Scheibling (Univ. Louis Pasteur, Strasbourg, France).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.117

The $^{184}W + ^{184}W$ collision was measured at 8.2 MeV/u in order to correct for possible secondary effects in other ^{184}W -induced reaction studies. Surprisingly a negative drift attaining 3 charge units for $TKEL = 300$ MeV was observed in the measured (secondary) distributions. Such a drift can be explained either by light charged particle evaporation or by sequential fission. (1 ref.)

75035 Fission following capture reactions of $^{32}S + ^{208}Pb$. M.B.Tsang, D.Arduin (Cyclotron Lab., Michigan State Univ., Lansing, MI, USA), B.B.Back, P.A.Baisden, R.Betts, C.K.Gelbke, W.G.Lynch, M.A.McMahan, S.Saini, Z.Xu.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.118

Cross sections, angular and mass distributions were measured for the reaction $^{208}Pb(^{32}S, f)$ at incident energies between 180 and 270 MeV. At 250 and 266 MeV, a sizeable fraction of the capture cross section corresponds to angular momenta of vanishing liquid drop fission barrier. However, even at lower energies the observed large angular anisotropies cannot be reproduced by using average liquid drop model parameters. This fact has been taken as evidence for the occurrence of fast fission processes. This conclusion is corroborated by the observed rapid increase of the fission fragment mass distributions with incident energy. (4 refs.)

75036 Angular momentum dependence of fission barriers. J.vander Plicht, H.C.Britt, M.M.Fowler, Z.Fraenkel, A.Gavron, J.B.Wilhelmy (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA), F.Plasil, T.Awes, G.R.Young, O.Hansen, C.Thorn, H.E.Wegner.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.119

The effect of angular momentum on fission barriers is investigated by studying excitation functions and angular distributions for various heavy-ion-induced-fission reactions. The authors obtained data on fission from the following reactions: $^{20}O + ^{142}Nd$, $^{14}Mg + ^{134}Ba$, $^{32}S + ^{126}Te$, $^{64}Ni + ^{94}Zr$, $^{96}Be + ^{177}Hf$, $^{12}C + ^{174}Yb$, $^{16}O + ^{170}Er$, $^{26}Mg + ^{160}Gd$, $^{32}S + ^{192}Os$, $^{12}C + ^{198}Pt$. (2 refs.)

75037 Potential pockets in the $^{238}\text{U} + ^{238}\text{U}$ system and their possible consequences. V.E.Oberacker (Phys. Dept., Vanderbilt Univ., Nashville, TN, USA), M.J.Rhodes-Brown, W.Greiner.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.120. Two experimental groups have recently studied positron emission in $^{238}\text{U} + ^{238}\text{U}$ reactions at $E_{\text{lab}} = 5.8 \text{ MeV/u}$ ($E_{\text{cm}} = 690 \text{ MeV}$). Positron energy spectra were measured in coincidence with ions scattered into various narrow angular windows. A preliminary analysis shows sharp maxima in the positron spectra located at 370 keV with a width $\Delta = 90 \text{ keV}$. The peak structure is not pronounced at ion scattering angles $\theta_{\text{lab}} = 45^\circ$ and vanishes around 209° . If the observed peaks are of atomic origin as expected theoretically (diving of the vacant quasi-molecular $1s$ -level into the lower continuum $E < -m_e c^2$), it must be produced in a very long-lasting U+U reaction ($T \approx 4 \times 10^{-20} \text{ s}$). The main problem with the above argument is the low beam energy which corresponds to only 95% of the 'spherical' Coulomb barrier height, using $R_{\text{int}} = 1.16(A_1^{1/3} + A_2^{1/3} + 2) \text{ fm}$. All conventional U+U interaction potential models predict dominant Rutherford scattering at this energy and hence much shorter times ($T \sim 2 \times 10^{-21} \text{ s}$). Greiner (1981) suggested that the prolonged nuclear sticking time might be caused by 'pockets' in the U+U interaction potential caused by the static β_2 and β_4 deformations of the nuclei. The authors have investigated the potential $U(r)$ within the framework of the double-folding model. $U(r)$ is obtained by averaging an appropriate nucleon-nucleon interaction over the matter distributions of the two colliding nuclei. (3 refs.)

75038 Possible sub-Coulomb resonances and fusion doorways in collisions of deformed heavy ions. W.T.Pinkston (Inst. for Theoretical Phys., Univ. of Frankfurt am Main, Frankfurt am Main, Germany).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.121. Calculations by Oberacker and Rhodes-Brown and by Seiwert predict 'pockets', i.e. secondary minima, in the interaction potentials of deformed heavy ions. These secondary minima occur for special relative orientations of the nuclear symmetry axes and for internuclear distances somewhat greater than conventional estimates of Coulomb barrier radii based on the assumption of spherical nuclei. Resonances resulting from trapping in these pockets could serve as doorways for sub-Coulomb fusion and might provide the 'sticking time' needed to explain the discrete structures in spectra of positrons produced in the collisions of very heavy ions (U-U, U-Cu). The resonant states, of angular momentum J , are special linear combinations of states of relative angular momentum L , and of the rotational momenta I_1, I_2 of the colliding nuclei. These linear combinations result in the preferred nuclear orientation. The results of calculations based on an oversimplified resonance model will be presented. The problems of obtaining a clear experimental signature of such resonances will be discussed. (no refs.)

75039 Energy dependence of ^{14}N mean free path in nuclear emulsions below 250 MeV per nucleon. N.Ashalata Devi, R.Bhanja, I.Dhar Ojha, R.R.Joseph, M.Shyam, S.K.Tuli (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.122. Accurate information about the cross-sections of light nuclei with nuclear targets is of interest from several points of view. While detailed measurements are available at energies of a few MeV and also extensive work at the relativistic energies of a few GeV, the transition region of intermediate energies has comparatively limited data. The authors have measured the mean free path which is directly related to cross-sections in nuclear emulsions for the collisions produced by ^{14}N nuclei in an exposure at the Bevalac. (2 refs.)

75040 Direct measurement of reaction cross-section for ^{12}C projectiles at 1016 MeV. S.Kox, C.Perrin, N.Longueue, M.Buenerd, R.Cherkaoui, A.J.Cole, J.Menet, J.B.Viano (Inst. des Sci. Nucleaires, Grenoble, France), A.Gamp, R.Berthollet, C.Guet, J.Pinston.

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.125. Considerable interest raised up recently in the experimental determination of reaction cross-section for heavy-ions. The variation of σ_r as a function of the incident energy the ion has been shown to follow the nucleon-nucleon cross-section rather than reaching the geometrical limit arising from a simple strong absorption picture. In order to investigate carefully this energy dependence, an experimental set-up has been designed, which allows a direct measurement of σ_r using beam attenuation method. Incident projectiles ($\sim 10^8 \text{ s}^{-1}$) are counted by a scintillator foil, whereas a scintillator frame is used to define the beam size on the target. Four meters downstream a scintillator slab of proper thickness allows counting the transmitted particles and provides a ΔE signal used for identification when combined with time of flight measurement. (4 refs.)

75041 A method for analytic evaluation of reaction rates for low energy nucleus-nucleus collisions in a hot gas of nuclei. H.J.Haubold, R.W.John (Zentralinst. für Astrophys., Akad. der Wissenschaften, Potsdam, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.140 (3 refs.)

75042 Collective phenomenon in nucleus-nucleus interaction.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.136.

A lot of interest has been evoked in the possibility of the occurrence of collective phenomenon like nuclear shock waves in nucleus nucleus collisions at high energies. An experimental study of high energy nucleus-nucleus collisions offer a possibility to expose certain properties of nuclear matter at abnormally high densities due to these shock waves. In this experiment various experimental parameters like short range angular correlations, asymmetry and coplanarity parameters, etc. have been used which are sensitive to indicate emission of fragments from collective phenomenon in such interactions. The data used are from Fe-emulsion interactions at 1.77 GeV/A . About 400 events have been analysed for the effect. The data give some indication of the asymmetry in the emitted fragments.

75043 Fe-nucleus interactions at 1.8 GeV/nucleon.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.137.

Recently a lot of interest has been shown in the field of ion-ion interactions. In the present work the general characteristics of Fe-emulsion interactions at 1.77 GeV/nucleon have been studied. The result on mean free path, geometri-

cal cross-section, frequency distribution of black, grey and heavy fragments ($Z \geq 2$) are discussed and compared with the available data of others.

75044 Emission of α fragments in nucleus nucleus collision at high energy. R.Bhanja, N.A.L.Devi, R.R.Joseph, I.D.Ojha, M.Shyam, S.K.Tuli (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.138.

The authors report on the α fragment emission in the interaction of ^{14}N with emulsion nuclei at 2.1 GeV/A . The identification of fragments has been done by taking into account the blob density B , gap density H > than a length $t(1.2 \text{ u})$ and gap length coefficient $G(B = \text{He}^{+4})$. (3 refs.)

75045 Search for anomalies in projectile fragments from Ar-emulsion interactions. R.R.Joseph, R.Bhanja, M.Shyam, S.K.Tuli (Dept. of Phys., Banaras Hindu Univ., Varanasi, India), S.B.Beri, V.S.Bhatia, G.Kaur, M.Kaur, I.S.Mitra, A.Bharti, K.B.Bhalla, M.Chaudhary, V.Kumar, S.Lokanathan, S.Satti, V.K.Gupta, G.L.Kaul, S.Kumar, L.K.Mangotra, Y.Prakash, N.K.Rao, S.Sankhyadhar.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.139.

The authors have collected more than 1500 Ar-emulsion interactions by line scanning. The projectile fragments ($Z \geq 2$) from these interactions are followed until they interact to give secondary, tertiary or higher generation interactions or leave the stack. Mean free path analysis of about 1200 such secondary or later generations is presented and possible evidence for the existence of anomalies will be discussed.

75046 Search for 'anomalons' in 4.5 A GeV ^{12}C -emulsion interaction. D.Ghosh, J.Roy, D.Banerjee, K.Sengupta, S.Naha (Dept. of Phys., Jadavpur Univ., Calcutta, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.140.

A stack of emulsion plates exposed to $4.5 \text{ A GeV } ^{12}\text{C}$ beam has been scanned to study whether the interaction mean free paths in nuclear emulsion of relativistic projectile fragments emitted are anomalously shorter for a fewer centimetres after their emission than at larger distances. The tracks were followed systematically through the stack, to search for these 'anomalons'.

75047 Pion laser study in relativistic nuclear collision. D.Ghosh, J.Roy, D.Banerjee, K.Sengupta, M.Basu, S.Naha (Dept. of Phys., Jadavpur Univ., Calcutta, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.141.

Presents an investigation on the coherent pion processes in relativistic heavy ion collision using data from emulsion plates exposed to ^{16}O beams at 2.1 GeV/nucleon . The inclusive pion distribution at different angular intervals has been compared with the chaotic and Poisson's distribution and information on coherent pion processes was obtained by looking for deviation from Poisson. The possible significance of the results has been discussed.

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

75048 The scattering of positive kaons by nuclei. M.Krell (Dept. de Phys., Univ. de Sherbrooke, Sherbrooke, Quebec, Canada), A.W.Thomas. *Can. J. Phys. (Canada)*, vol.61, no.5, p.703-8 (May 1983).

The authors examine the sensitivity of low energy positive kaon (K^+)-nucleus scattering to the neutron distribution. By using the technique of isotope comparison which has worked well for low energy pions, they find that there seem to be 'windows' where one could already learn something quantitative about the neutron distribution despite the poorly known K^+ -nucleon phase shifts. (19 refs.)

75049 The A dependence and threshold behaviour of the inclusive ($\pi, 2\pi$) reaction for $T=0$ nuclei. J.Cohen (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).

J. Phys. G (GB), vol.9, no.6, p.621-9 (June 1983).

The author calculates the dependence of the energy-differential inclusive cross section for the ($\pi, 2\pi$) reaction on the mass number A for $N=Z$ nuclei up to $A \sim 60$. He also calculates the variations of this cross section near threshold, where the outgoing pions have almost zero energy. He finds a significant A dependence resulting from the dominance of the increase in number of active particles over the decrease of matrix element squared. The threshold behaviour is strongly affected by Coulomb distortions of the outgoing pions, and he finds a large difference between the ($\pi^+, 2\pi^+$) and the ($\pi^-, \pi^+ \pi^-$) cases. The true absorption of final pions is also checked; and found to be of secondary importance. All cases are studied as a function of g' , the Migdal spin-isospin parameter. (22 refs.)

75050 Three-body model for p -wave pion- ^{16}O scattering. K.A.Kabir, M.Silver, N.Austern (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2104-22 (May 1983).

A calculation of the elastic scattering of mesons from ^{16}O is performed, using a modification of the first-order multiple scattering theory of Kerman, McManus, and Thaler (1959), in which Pauli blocking effects are omitted from the τ operator. The modified τ operator is calculated in a three-body model, in which the struck nucleon is allowed to recoil in a Woods-Saxon nuclear shell model potential exerted by the remainder of the nucleus. The interaction between the meson and the struck nucleon is described by a separable potential. A set of coupled differential equations that describe the elastic and the excited channel wave functions is derived by approximating the shell model binding potential in the excited states of the nucleon as a potential for the meson-nucleon center of mass. This approximation is examined in detail. It is found that in the three-body model the bound states and the single particle resonances of the shell model potential alter the results significantly from those obtained in impulse approximation. (27 refs.)

75051 Threshold estimates of ($\pi, 2\pi$) on nuclei in the Fermi gas model: one-body mechanism. R.M.Rockmore (Dept. of Phys. & Astron., Rutgers State Univ., Piscataway, NJ, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2150-7 (May 1983).

The one-nucleon contribution to threshold pion production in pion-nucleus collisions is calculated using a Fermi gas model of the nuclear excitation spectrum in order to carry out the sum over final nuclear states. For the one-body input a threshold approximant to the production amplitude from the phenomenological Lagrangian theory is used. The cross sections are found to have an η^4 dependence near threshold, where $\eta=(\omega_\pi-2m_\pi)/m_\pi$ for total incident pion energy ω_π . In a simple eikonal approach incident pion attenuation is found to lead to a reduction of threshold estimates by a factor of ~ 10 . (20 refs.)

75052 Fermi motion and Pauli exclusion principle effects in $d(\pi^\pm, \pi^\pm p)n$ in the Δ -resonance region. G.Ramachandran, R.S.Keshavamurthy, S.B.Patangi, V.Ravishanker (Dept. of Phys., Univ. of Mysore, Mysore, India).

Phys. Rev. C (USA), vol.27, no.5, p.2198-202 (May 1983).

An ab initio method of taking Fermi motion effects in pion scattering into account combined with proper antisymmetrization of the two nucleon final state in $d(\pi^\pm, \pi^\pm p)n$ shows that the reaction amplitude consists of not only a contribution from pion scattering on a proton but also pion scattering on a neutron, and that the two amplitudes differ considerably in their π - N c.m. energies. The neutron scattering contribution to the differential cross section exceeds 10% in as many as 51 out of 194 π^- events recorded in a recent kinematically complete experiment by Hofsteezer et al. (1981) in the Δ -resonance region. In several kinematical situations the neutron contribution exceeds 100% and could even be as high as $\sim 400\%$. (5 refs.)

75053 Some characteristics of secondary particles produced in pion-nucleus collisions in emulsion at 50 GeV/c. S.Ahmad, H.Ahrar, A.R.Khan, A.Ahmad, M.Irfan, M.Zafar, M.Shafi (Dept. of Phys., Aligarh Muslim Univ., Aligarh, India).

Phys. Scr. (Sweden), vol.27, no.5, p.323-9 (May 1983).

The authors report results on multiparticle production in 50 GeV/c π^- -interactions with emulsion nuclei. The general characteristics of heavy and shower particle multiplicity distributions are compared with the results from p -nucleus collisions at the same incident energy. The various experimental results have also been compared with the predictions of the existing theoretical models. They have observed that the mean normalized multiplicity (R_{A2}) in hadron-nucleus interactions as a function of the effective number of projectile encounters, $\langle \nu \rangle$, calculated by using the additive quark model suggests a new kind of scaling and R_{A2} vs. $\langle \nu \rangle$ is independent of nature of the projectile. (31 refs.)

75054 Off-energy shell scattering of pions on deuterons. G.Ramachandran, R.S.Keshavamurthy, S.B.Patangi, V.Ravishanker (Dept. of Phys., Univ. of Mysore, Mysore, India).

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.67

Summary form only given, as follows. The authors analyse the recent experimental results of Hofsteezer et al. (1981) on $d(\pi^\pm, \pi^\pm p)n$ as a means to study the off-energy shell scattering of pions on nucleons. Their model takes ab initio into account the effects of Fermi motion and due consideration is also given to neutron scattering contributions arising out of the Pauli exclusion principle, which can even exceed 100% under appropriate kinematical situations. The present analysis reports preliminary results following some of the models for πN scattering suggested in recent years.

25.85 FISSION REACTIONS

75055 Fission probability in the $^{232}\text{Th}(p,p'xfn)$ reaction at low energy. Chien Chung (Dept. of Chem., Univ. of Maryland, College Park, MD, USA), J.J.Hogan, H.H.Muller.

Can. J. Chem. (Canada), vol.61, no.4, p.646-8 (April 1983).

In recent works, a model was developed to calculate many of the features of $^{232}\text{Th}(p,x)$ reactions with incident proton energies to 100 MeV. The model reproduced many properties such as spallation excitation functions, total fission cross sections, the symmetric/asymmetric mass ratio, and fission charge dispersion data. In this work, the model approach is extended to consider the fission probability in $^{232}\text{Th}(p,p'xfn)$ fission channels. A comparison of the

results calculated from the model to the experimental data shows very good agreement, and again justified the approach of the model. (13 refs.)

75056 Yields of products in the spontaneous fission of ^{252}Cf by direct γ -ray spectroscopy. L.Toppare, H.N.Erten, N.K.Aras (Dept. of Chem., Middle East Tech. Univ., Ankara, Turkey).

Can. J. Chem. (Canada), vol.61, no.4, p.649-51 (April 1983).

Yields of products both in the light and heavy sides in the spontaneous fission of ^{252}Cf were measured by direct γ -ray spectroscopy technique. By suitably choosing collection, cooling, and counting times, it was possible to observe products with half-lives between 1 min and 1 h. A definite fine structure, as observed in the case of thermal neutron fission of ^{235}U and ^{239}Pu , was not observed. A graphical method was utilized to obtain the number of neutrons as a function of fragment mass using cumulative chain yields. (18 refs.)

75057 Nuclear charge distribution in fission: fractional cumulative yields of isotopes of krypton and xenon in $^{249}\text{Cf}(n_{\text{th}}, f)$ and $^{250}\text{Cf}(sp, f)$. H.-H.Meixler, K.Wolfsberg, H.O.Denschlag (Inst. für Kernchem., Univ. Mainz, Mainz, Germany).

Can. J. Chem. (Canada), vol.61, no.4, p.665-70 (April 1983).

The fractional cumulative yields (%) of the following rare gas isotopes were determined radiochemically in the thermal neutron induced fission of ^{249}Cf and in the spontaneous fission of ^{250}Cf and the following results were obtained for the two processes, respectively: ^{89}Kr : 77.6 ± 1.5 , —; ^{91}Kr : 31.0 ± 1.7 , ^{140}Xe : 12.5 ± 2.0 , ^{147}Xe : 4.0 ± 0.3 , ^{141}Xe : 32.0 ± 3.5 , ^{139}Xe : 32.0 ± 3.5 , ^{142}Xe : 0.9 ± 0.1 , <3.61 , and ^{143}Xe : 0.22 ± 0.08 , —. The results are discussed with respect to the systematics of nuclear charge distribution in fission. (24 refs.)

75058 Mass spectrometric determination of Rb fission yields from ^3He and ^4He induced fission of ^{238}U and ^{232}Th . P.L.Reeder (Pacific Northwest Lab., Richland, WA, USA).

Can. J. Chem. (Canada), vol.61, no.4, p.786-93 (April 1983).

Cumulative and independent fission yields of Rb isotopes have been measured for ^3He and ^4He induced fission of ^{232}Th and ^{238}U at bombarding energies slightly above the Coulomb barriers. The on line mass spectrometric technique provided yields for masses 89-97. Mean masses and widths of the Rb independent yield distributions were obtained and were compared to other fissioning systems with excitation energies up to 160 MeV. (31 refs.)

75059 Energy dependence of the probability for asymmetric fission of ^{213}At . E.N.Gruzintsev, M.G.Itkis, V.N.Okolovich, A.Ya.Rusanov, G.N.Smirenkin, V.N.Tolstikov (Inst. of Nuclear Phys., Acad. of Sci., Kazakh SSR).

JETP Lett. (USA), vol.36, no.8, p.372-6 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.8, p.304-7 (20 Oct. 1982). [received: June 1983]

The mass distribution of the fragments of the fission of ^{213}At in the reaction $^{209}\text{Bi}(\alpha, f)$ has been measured for α energies in the range 34.7-50 MeV. Over the entire energy range studied, the asymmetric mode is an improbable, slightly energy-dependent mode for the ^{213}At fission. This property of the ^{213}At fission represents a qualitative distinction from the fission of heavy nuclei. (7 refs.)

75060 The concept of vibrational resonances associated with the secondary and tertiary wells of a multi-humped fission barrier. J.E.Lynn (Nuclear Phys. Div., AERE Harwell, England).

J. Phys. G (GB), vol.9, no.6, p.665-81 (June 1983).

Large-scale structures in the fission cross sections of the lower-charge actinides are commonly interpreted as pure vibrational (transmission) resonances associated with a well in the fission barrier. This well is often hypothesized to be a tertiary well, the secondary well of a double-humped barrier being too deep (according to most theoretical models) to allow undamped vibrational modes at the excitation energies involved. The author considers the possible width and strength ratios of low-lying states associated with secondary and tertiary wells, investigating the deviation, due to coupling of single-particle and vibrational motions, of these properties from the simple expectations of a simple transmission model. This deviation is found to be considerable. Comparison of the calculated resonance properties with experimental data is made; this slightly favours the tertiary well hypothesis. Overall, the results indicate that more detailed fission cross section and angular distribution measurements in conjunction with more realistic model calculations of the type outlined in this paper could help bring a definitive answer to the problem of the structure of the light actinide fission barriers. (11 refs.)

75061 Mass distributions in monoenergetic-neutron-induced fission of ^{239}Pu . J.E.Gindler, L.E.Glendenin, D.J.Henderson, J.W.Meadows (Argonne Nat. Lab., Argonne, IL, USA).

Phys. Rev. C (USA), vol.27, no.5, p.2058-62 (May 1983).

Fission product yields for 24 masses were determined for the fission of ^{239}Pu with essentially monoenergetic neutrons of 0.17, 1.0, 2.0, 3.4, 4.5, 6.1, and 7.9 MeV. Fission product activity were measured by Ge(Li) γ -ray spectrometry of irradiated ^{239}Pu targets and by chemical separation of the fission product elements followed by β counting. Yields of near symmetric (valley) fission products increase nearly monotonically with incident neutron energy and do not exhibit a break in the slope of the yield versus neutron energy curve in the energy region where second-change fission begins. This is in contrast to the curves for ^{232}Th , ^{235}U , and ^{238}U neutron-induced fission. (17 refs.)

75062 Induced nuclear fission viewed as a diffusion process: transients. P.Gränge (Univ. Louis Pasteur, Strasbourg, France), Li Jun-Qing, H.A.Weidenmüller.

Phys. Rev. C (USA), vol.27, no.5, p.2063-77 (May 1983).

Induced nuclear fission is viewed as a diffusion process of the fission degree of freedom over the fission barrier. The authors describe this process in terms of a Fokker-Planck equation which contains the fission variable and its canonically conjugate momentum. They solve this equation numerically for several energies (temperatures) of the fissioning nucleus neglecting changes of the fission barrier due to the temperature dependence of nuclear shell effects. They pay particular attention to the time τ needed for the system to build up the quasistationary probability flow over the fission barrier. The rate of the latter is approximated in terms of the Bohr-Wheeler formula or Kramers' transition state expression; the precise value of the quasistationary current depends on the nuclear friction constant β . Their results for τ are consistent with those obtained earlier in the framework of a simplified model. As long as $\beta \leq \beta_0$, the time τ is proportional to β^{-1} . This relationship exhibits the fact that with increasing friction β , the diffusion process is accelerated, so that it takes the system increasingly less time to attain the quasistationary distribution. The constant β_0 is roughly given by $2\omega_1$, where ω_1 is the frequency of a harmonic oscillator potential which oscillates the potential at the minimum corresponding to the initial configuration of the fissioning nucleus. The condition $\beta \leq \beta_0$ is roughly equivalent with the motion in that minimum being underdamped. The converse relationship τ increases with β is found for $\beta > \beta_0$. They ascribe this to the fact that now the fission variable executes an overdamped motion. Generalizing Kramers' original derivation, they obtain an analytical expression for the time dependence of the probability current

over the fission barrier. For $\beta \leq \beta_0$, this expression agrees well with their numerical results. They use it to calculate the energy dependence of the fission probability P_f and find that P_f grows much less rapidly with increasing excitation energy than would be predicted by the Bohr-Wheeler formula. This is in qualitative agreement with recent experimental findings and suggests that the energy dependence of P_f deserves further investigation and can be used to determine β experimentally. Their analysis does not yet include the additional time delay incurred by the system on its way from the saddle to the scission point. Clearly the time needed to establish the quasistationary situation at the scission point will be larger than τ . This would probably lead to additional modifications of the energy dependence of P_f . (16 refs.)

75063 Yields of the photofission products of ^{237}Np . M.Ya.Kondrat'ko, A.V.Mosov, K.A.Petzhak, O.A.Tedorovich. *Sov. At. Energy (USA)*, vol.53, no.3, p.629-32 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.164-7 (Sept. 1982). [received: May 1983] The systematics of fission product yields and the possible application of these data for the nondestructive determination of fissile substances is considered. The authors investigate the mass and charge distributions of the photofission products of ^{237}Np in the region of the maximum bremsstrahlung energy of 22-28 MeV, using γ -spectrometric and radio-chemical methods. (7 refs.)

75064 Prompt light-ion emission in the $^{235}\text{U} + ^4\text{He}$ reaction at 40 MeV/u*. K.Kwiatkowski, V.E.Viola, Jr. (Indiana Univ., Bloomington, IN, USA).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.113. The spectra of H and He ions in coincidence with angle-correlated fission fragments have been measured for the $^{235}\text{U} + ^4\text{He}$ reaction at 40 MeV/u. These studies were performed at the University of Maryland cyclotron and employed a pair of $6 \times 46 \text{ mm}^2$ position-sensitive ion-implanted detectors to measure the angle between coincident fission fragments, θ_{AB} , along with an array of detector telescopes to detect coincident light ions. (2 refs.)

75065 Study of fission-like products in the $^{84}\text{Kr} + ^{24}\text{Mg}$ reaction at 5.83 E/A (MeV). B.Heusch, J.P.Coffin, P.Engelstein, G.Guillaume, F.Rami (Univ. Louis Pasteur, Strasbourg, France).

Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.114. The Kr+Mg reaction was carried out in the framework of a systematic to study the compound or composite system ^{108}Cd deexcitation dependence versus the asymmetry between different projectile and target mass combinations. Such results exist for the extreme entrance channels, p+Ag, $^{12}\text{C} + ^{98}\text{Mo}$, $^{19}\text{F} + ^{89}\text{Y}$ and the more symmetric channels $^{32}\text{S} + ^{74}\text{Ge}$. The present $^{84}\text{Kr} + ^{24}\text{Mg}$ study was undertaken because a clear separation of fission like contribution from deep inelastic processes was expected, similar to what has been observed for the neighbouring system $^{84}\text{Kr} + ^{27}\text{Al}$ at GSI. (2 refs.)

25.88 FUSION REACTIONS

75066 A tool to study collective transitions between excited nuclear states. W.Knupfer, M.G.Huber (Inst. for Theoretical Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany). Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.102.

The radiative capture of two complex nuclei into a specific bound state 1ν of the united nucleus A (radiative fusion) $A_1(Z_1, N_1) + A_2(Z_2, N_2) \rightarrow A(Z_1 + Z_2, N_1 + N_2) + \gamma$ requires the coherent cooperation of all nucleons. This process can be used as an appropriate spectroscopic tool to investigate the existence of dinuclear substructures in the nuclear excitation spectrum and the possible existence of collective transitions between excited states. The authors present a microscopic model which allows one to convert completely the free energy of the entrance channel into a specific intermediate resonance A^* , which then is deexcited by a collective phototransition into an excited state 1ν of the united nucleus, A. This model has been applied to the $^{12}\text{C}(\alpha, \gamma)^{16}\text{O}(\mu - \nu)$ reaction. (3 refs.)

- 75067 Multislab multigroup transport theory with L th order anisotropic scattering. R.D.M.Garcia, C.E.Siewert (Dept. of Nuclear Engng. & Math., North Carolina State Univ., Raleigh, NC, USA). *J. Comput. Phys. (USA)*, vol.50, no.2, p.181-92 (May 1983). The special case of a triangular transfer matrix relevant to multigroup transport theory in multislabs with L th order anisotropic scattering is discussed, and the F_N method is used to establish accurate numerical results for a test problem. (5 refs.)
- 75068 Distribution of the flux density and hardness of the neutron spectrum with height and over the cross section of the heat-generating assemblies of VVER-365 and VVER-440 reactors. B.A.Bibichev, V.P.Maiorov, V.D.Sidorenko, P.I.Fedotov. *Sov. At. Energy (USA)*, vol.53, no.3, p.596-601 (Sept. 1982). Translation of: *At. Energy (USSR)*, vol.53, no.3, p.143-7 (Sept. 1982). [received: May 1983] The flux density and spectrum of the neutrons in the active zones of VVER-365 and VVER-440 reactors (water-cooled-water-modulated power reactors) can only be measured in special channels located in the central tubes of the heat-generating assemblies (HGA). The distribution of the flux density and spectrum of the neutrons with the HGA height is measured with the help of activation detectors in these channels. Experimental data on the distribution of these quantities over the HGA cross section are also necessary for checking and correcting the computational programs. Such information can be obtained from the concentration of certain fission products in the fuel after the HGA are unloaded from the reactor. (11 refs.)
- 75069 Neutron yield of the (α,n) reaction for multicomponent media. V.I.Bulanenko, V.V.Frolov, E.M.Tsenter. *Sov. At. Energy (USA)*, vol.53, no.3, p.622-8 (Sept. 1982). Translation of: *At. Energy (USSR)*, vol.53, no.3, p.160-4 (Sept. 1982). [received: May 1983] There has been a steady rise in the production and use of α -active nuclides in nuclear engineering, and it is necessary to know the accurate neutron yield Q for the solution of many practical problems, a detailed and reasoned list of which is given in the review. The components of Q are spontaneous nuclear fission and (α,n) reactions in light elements with $Z \leq 20$. The importance of taking (α,n) reactions accurately into account is illustrated. In view of the difference in composition of the set of materials and components actually used, it is preferable to obtain accurate information by calculational means. Whereas the calculation of the neutron yield of spontaneous fission with known nuclear data is not difficult, the calculation of the neutron yield of the (α,n) reaction $Q^{\alpha n}$ is far from obvious. Individual aspects of determining $Q^{\alpha n}$ and its dependence on the α -particle energy and composition of the medium have been considered. Systematic and critical analysis of these calculations, and also on the analysis of sources of error are discussed. (36 refs.)
- 75070 Research proposal for advanced diffractometer (US-Japan collaborative research in neutron scattering). M.Iizumi, S.Funahashi. Report JAERI-M-82-157, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 34 pp. This paper is the proposal submitted to the US-Japan meeting (1980) for the collaborative research in neutron scattering, in which it is proposed to carry out various kinds of new measurements by using the wide angle, curved linear position-sensitive counter. The time-division measurement of the diffraction patterns and the single-crystal diffractometry utilizing the inclination geometry are the principal research area proposed.

28.41 FISSION REACTOR THEORY AND DESIGN

- 75071 Nuclear data requirements for the design of fast neutron reactors. L.N.Usacev. *Yad. Energ. (Bulgaria)*, no.18, p.3-8 (1983). A survey of the basic requirements of nuclear data for fast neutron reactors is made with a view of present-day state of affairs in the data field. Particular emphasis is laid upon the areas developed within the framework of the cooperation among the CMEA member-countries. (9 refs.)
- 75072 Modification of the SUPERTOG program for operation with libraries containing tabulated densities of the elastic scattering anisotropy. G.K.Voykov, V.I.Gadjokov, K.D.Ilieva. *Yad. Energ. (Bulgaria)*, no.18, p.40-8 (1983). For the calculation of the group-to-group transfer matrix with the SUPERTOG program it is necessary to specify the data for the anisotropy of the elastic scattering with the coefficients of expansion of the density function into Legendre polynomials. For all materials of the ENDL library and for some materials from FND/FB-IV, the information for the scattering anisotropy is specified as tabulated values of the density function itself. For these materials the existing versions of SUPERTOG are inapplicable. The modification of the SUPERTOG program prepared by the authors makes the calculation of the elastic scattering matrix possible using the two ways of anisotropy setting. A method based on approximation with orthonormal polynomials is used for computing the required coefficients within the process of the program itself. This procedure takes up less than 15% of the SUPERTOG machine time. (6 refs.)
- 75073 Software for neutron physical calculations of fast neutron reactors. J.D.Jordanov, N.A.Antonov. *Yad. Energ. (Bulgaria)*, no.18, p.94-103 (1983). A set of programs has been developed for neutron physical calculations of fast neutron reactors. The set includes the PRIDAN program for calculating the effective cross-sections of the media, characteristic of the fast reactor systems, the MED program—a single dimension multigroup program for calculating fast reactors in the multigroup diffusion approximation and the ANALIT program for calculating the criticality in plane geometry. PRIDAN uses the formalism of the self-shielding factors and prepares the effective cross-sections using an iterative procedure. The values of the multigroup cross-sections obtained for different temperatures are used directly as input data for the other programs. MED calculates the critical dimensions, the coefficient of effective multiplication, the real and conjugated neutron flux, the integrated neutron fluxes for each energy group and each spatial zone, the distribution of the neutron fission sources. The ANALIT program solves under given conditions the diffusion multigroup equation analytically using a method proposed by the authors. The body of mathematic pertaining to the case is presented. (12 refs.)
- 75074 A FAST program for determining the neutron physical parameters of fast neutron reactors. J.D.Jordanov, N.A.Antonov. *Yad. Energ. (Bulgaria)*, no.18, p.104-9 (1983). The FAST program is part of the modulus developed at the Institute for Nuclear Research and Nuclear Energy in Sofia for calculating the neutron physical parameters of the fast neutron reactors. The program is written in FORTRAN IV. It calculates the normalized integral fluxes, the reaction rates, the leakages, the critical masses for the plutonium isotopes and the quantities characterizing the breeding of plutonium in the reactor. A test example is given for illustrating the program. (3 refs.)
- 75075 On-line fault diagnosis in a nuclear reactor by sequential testing. A.Ray, M.Desai, J.Deyst (Charles Stark Draper Lab. Inc., Cambridge, MA, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.3, p.1850-5 (June 1983). A sequential test technique for on-line fault diagnosis of sensor signals has been developed and successfully demonstrated in an operating nuclear reactor. The methodology provides a systematic procedure for detection and isolation of sensor failures by taking into account consistencies among all available measurements of a given process variable. Fault diagnosis is accomplished on the basis of the cumulative information derived from the measurement history that includes the past and current observations. (10 refs.)
- 75076 Iconic displays, Rankine cycles and human factors for control rooms of nuclear power plants. L.Beltracchi. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.3, p.1856-61 (June 1983). This report discusses a concept for a nuclear power plants process iconic display to model the plant in the control room of a pressurized-water-reactor. The iconic display is based on the Rankine Cycle, a thermodynamic model for the power cycle. The display image contains coded information on the generation, transport, and removal of heat in the power plant process. (4 refs.)
- 75077 A pattern recognition method for nuclear reactor core surveillance. M.Invernizzi. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.3, p.1885-91 (June 1983). An automatic method for reactor core surveillance is described which employs pattern recognition techniques. A core vibration surveillance method for a pressurized water reactor has been developed which provides the early detection of failures. The sensors are eight ex-core ionization chambers. The algorithms used are heuristic but need only the definition of a small number of parameters. (16 refs.)
- 75078 Accreditation of qualification testing organizations the industry viewpoint. A.R.Roby (Northeast Utilities Service Co., Hartford, CT, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.3, p.1917-19 (June 1983). The author presents the industry viewpoint on the program for the Accreditation of Qualification Testing Organizations, which has been proposed for rulemaking by the Nuclear Regulatory Commission. Presented is the industry perspective, developed and prepared through the AIF, identifying the serious concerns which the accreditation program has raised. Discussed are the disadvantages of the program and those present benefits which would be lost if the program was adopted. The value of greater emphasis on current regulation to improve the qualification processes is presented and details areas where the NRC proposals do not provide adequate justification for the accreditation program. (no refs.)
- 75079 Unbounded solutions of the nonlinear system of equations of nuclear-reactor kinetics. Yu.A.Kuznetsov, V.V.Shashkov (Sci.-Res. Inst. of Mech., N.I. Lobachevski State Univ., Gorki, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.545-7 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.587-92 (July 1982). [received: April 1983] The authors study the nonlinear integro-differential system of equations of reactor kinetics in the general form. The system of equations describes the evolution with time of the spatial and velocity distribution of neutrons and the spatial distributions of the precursors of delayed neutrons and the temperature of the medium in a nuclear reactor with allowance for feedback. (15 refs.)

75080 Harmonic simulation of a power reactor. P.T.Potapenko. *Sov. At. Energy (USSR)*, vol.53, no.3, p.608-13 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.151-5 (Sept. 1982). [received: May 1983] The design of the control systems of contemporary power reactors is based on the distributed mathematical model of a reactor. The transfer matrix of a reactor relates the vector of the variation of the neutron distribution (ND) in individual zones or channels to the vector of the variation of the position of the regulating rods (the reactivity), and it is actually adopted as the mathematical model of a reactor. The difficulties in the experimental computational determination of the static transfer matrix are associated with the nonunique activation of a reactor to the critical steady state. The author presents an harmonic model of a power reactor. (14 refs.)

75081 WIMSCORE - A code for producing group constants for TDB, TRITON and CITATION codes from WIMS output. Y.Bartal, S.Yiftah. Report IA-1380, Israel Atomic Energy Comm., Yavne (Jan. 1983), 22 pp. A code was developed for producing group constants and other data needed for reactor core burnup calculations. The code named WIMSCORE gets its input from WIMS output files and evaluates it to be served as input to the diffusion-burnup codes TDB, TRITON and CITATION. The purpose of this code is to facilitate the automation of data transfer between codes which is otherwise a very time consuming and bound-to-error process. (11 refs.)

75082 Comparisons of energy dependent point-wise cross-section generation codes: RESEND, RESEND, RECENT. A.Hasegawa, T.Narita. Report JAERI-M-82-128, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Sept. 1982), 52 pp.

In order to improve the current situation for production of group cross-section sets, the authors performed intercomparison of energy dependent cross-section generation codes, i.e. RESEND, RESEND and RECENT which are currently used in the nuclear data community. And also the results were contributed to the international comparisons of energy dependent cross-section generation codes, organised by Dr. Cullen of IAEA. (7 refs.)

75083 A three-dimensional improved quasi-static core model for nuclear reactor control room simulators. S.G.Wagner, A.T.Shesler (Nuclear Power Systems, Combustion Engng. Inc., Windsor, CT, USA). Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.2/01-17 vol.1

With the availability of powerful modern mini-computers, more sophisticated and accurate modeling is now expected of nuclear reactor control room simulators. Today, such simulators must model a wide range of operational and accident conditions which place great demands on computers and models. The core model in Combustion Engineering Calvert Cliffs I full scope control room simulator illustrates this trend. It features a full core, three-dimensional space-time neutronic and thermal-hydraulic model and runs on one of the simulator's Perkin Elmer 3244 computers using a small fraction of that machine's computing capability. Addition of thermal-hydraulics and a new approach to the improved quasi-static method (IQSM) are described. The resulting model has successfully simulated operational and accident transients with a speed of 40 to 80 msec per reactor second. Thus, it fits easily into the real time requirements of the integrated simulator. (7 refs.)

75084 Interactive simulation of boiling water reactor systems using DARE P and VAX. K.Schwarzblat, M., D.Hetrick, J.Arellano G., J.M.Perez, A.Vilalobos, F.Mujica (Inst. de Investigaciones Electricas, Morelos, Mexico). Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.5/01-5 vol.1

A small engineering simulator for the Laguna Verde Nuclear Power Station in Mexico has been developed at the Instituto de Investigaciones Electricas (IIE) in Cuernavaca. The simulator is in the form of an input file for the DARE P Continuous System Simulation Language that was developed at the University of Arizona. Several new features have been added to interactive DARE for VAX by workers at IIE, including an optimization scheme for computing unknown initial conditions, a partitioning scheme to identify variables responsible for stiffness, and an optimization scheme for solving nonlinear algebraic equations that arise when fast variables are treated by the quasistatic approximation. The authors discuss the scheme for finding initial conditions, and present an example of a transient in the reactor and the recirculation flow controller. (4 refs.)

75085 Two phase flow simulator for a PWR nuclear power plants. M.A.Shinaishin (Reactors Dept., Atomic Energy Authority, Inshas, Egypt), M.N.Aly, Y.Abu-Shady. Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.14/01-23

The objective of this work is to develop a digital simulator of a complete Pressurized Water Reactor Nuclear Power Plant (PWRNPP) capable of simulating accidents in which vapor may be generated in the reactor core and transported along the primary loop. Extensive heat transfer correlations, two-phase friction multiplier and thermodynamic properties covering a wide range of pressure and temperature are included. Two models of the two phase flow, one of which has been adapted and the other has been developed, were implemented and responses were compared. In these models the void fraction, the heat transfer coefficients, and the two phase friction multiplier are defined differently. The results indicate negligible differences. (14 refs.)

75086 Whole-plant simulation for loop-type LMFBR dynamics. Y.Sagayama, M.Tanji (Advanced Reactors Engng. Dept., Mitsubishi Atomic Power Industries Inc., Saitama, Japan), H.Endo. Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.16/01-18 vol.1

A loop-type LMFBR of prototype plant is going to be developed in Japan. The whole-plant dynamic simulation program COPD (Code on Plant Dynamics) performs the basic tool of the characteristics analysis for control system design, evaluations of thermo-hydrodynamics for setting the design condition of components and accident analysis for explaining the validity of the reactor shutdown system of the plant. This paper describes the specifications of the model adapted to typical analysis items, verification of the model with the experimental results, reduction manner of the running cost and model improvement of the COPD program. (5 refs.)

75087 Application of real-time dynamic simulation of the analysis and design of large scale breeder reactor plants. F.J.Halfen, G.B.Kruger, R.A.Meyer (Advanced Reactor Systems Dept., General Electric Co., Sunnyvale, CA, USA).

Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.17/01-6 vol.1

Describes the approach being taken by GE-ARSD to the design of the Plant Control and Protection System (PCAPS) for a Large Scale Breeder Plant. The objective is to provide an approach to early 'front end' understanding of

the plant's transient, control and man-machine-interfaces using engineering simulation as a key design tool. This approach is intended to provide a superior PCAPS while minimizing the number of costly downstream design changes through more quantitative front-end analysis. The key element in the approach is the development of a minicomputer driven interactive engineering simulation facility using modern digital/CRT display hardware. This approach will also improve plant operability and facilitate safety reviews via plant operability validation testing while at the same time providing a focal point for PCAPS design integration. (1 ref.)

75088 A numerical integration approach suitable for simulating PWR dynamics using a microcomputer system. L.Zhiwei, T.W.Kerlin (Dept. of Nuclear Engng., Univ. of Tennessee, Knoxville, TN, USA). Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.18/01-25 vol.1

It is attractive to use microcomputer systems to simulate nuclear power plant dynamics for the purpose of teaching and/or control system design. An analysis and a comparison of feasibility of existing numerical integration methods have been made. The criteria for choosing the integration step using various numerical integration methods including the matrix exponential method are derived. (10 refs.)

28.42 FISSION REACTOR MATERIALS

75089 Nomogram for determining the terminal activity and necessary decay time after the periodical filling of a container with short-lived radioactive materials. J.Krischan, H.Binder (Inst. fur Radiochem., Innsbruck, Austria).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.455-67 (1982). In German. [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981). Describes a nomogram with auxiliary tables for determining the activity of radioactive waste in containers and the decay time required for activity to drop below legal limits. (5 refs.) J.S.

75090 Prediction of centrifugal pump cleaning ability in waste sludge. B.V.Churnetski (E.I. DuPont de Nemours & Co., Savannah River Lab., Aiken, SC, USA).

Nucl. & Chem. Waste Manage. (GB), vol.3, no.4, p.199-203 (1982). Radioactive waste at the Savannah River Plant (SRP) is being transferred from older waste tanks to new, stress-relieved tanks for more effective waste management. The technology developed for waste removal involves the use of long-shaft, recirculating, centrifugal pumps (slurry pumps). Testing completed at the Savannah River Laboratory's 30-meter-diameter mock-up waste tank related the effective cleaning radius (ECR) of a slurry pump to critical pump and material characteristics. Presently, this theory is being applied to radioactive waste at SRP. However, the technology can be applied to other remote handling situations where the slurry rheology can be determined. For SRP waste, an equation of the form $ECR \propto DV_0(\rho/\tau_0)^{1/2}$ was determined where D is the nozzle diameter, V_0 is the average initial velocity, ρ is the density of the slurry, and τ_0 is the yield stress of the slurry. Using this relationship, the cleaning performance of a pump operating in any SRP sludge environment can be predicted. Specifically, yield stress and density measurements on sludge samples can be used to predict the required number and effective location for slurry pumps in actual SRP waste tanks. (2 refs.)

75091 Current understanding of pitting and crevice corrosion and its application to test methods for determining the corrosion susceptibility of nuclear waste metallic containers. J.Kruger, K.Rhine (Center for Materials Sci., NBS, Washington, DC, USA).

Nucl. & Chem. Waste Manage. (GB), vol.3, no.4, p.205-27 (1982). A review of crevice and pitting corrosion mechanism and testing techniques is given to understand the fundamental problems involved in determining corrosion rates of alloys to be used as nuclear waste containers. The mechanisms are broken down into two sections, initiation and propagation of the crevice or pit. Theories of initiation include the absorbed ion displacement model, ion migration or penetration model and the breakdown-repair model. Experimental results concerning the initiation period include a discussion of the kinetics of initiation, the critical potential for breakdowns, and experimental factors

affecting the initiation. The theories of pit and crevice corrosion propagation are mentioned as well as factors affecting propagation. Several experimental techniques are discussed that are useful in determining the probability of pitting and/or crevice corrosion of alloys. In assessing the lifetime of the metallic container, accelerated tests are required. With this in mind the testing techniques concentrate on electrochemical techniques and various modifications of these basic techniques. Although susceptibility of alloys to pitting and crevice corrosion can be determined readily, initiation time and propagation rates are not as straightforward particularly over 1000 years. Nevertheless several testing techniques exist that may be used to determine these important values. (108 refs.)

75092 Incorporation of radionuclides in crystalline titanates. E.R.Vance, D.K.Agrawal (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).

Nucl. & Chem. Waste Manage. (GB), vol.3, no.4, p.229-34 (1982). The solid solubilities of some or all of Cs, Sr, Y, La, U, Th, and Na in each of barium hollandite, zirconolite and titanite were investigated by X-ray diffraction in samples prepared by ceramic techniques at 1100-1400°C. Various charge compensation schemes were used in attempts to incorporate aliovalent ions. Cs and Sr, but not the other ions, have extensive solid solubilities in barium hollandite. Zirconolite dissolves relatively large amounts of Na, as well as actinides and the smaller rare earths. Appreciable amounts of Sr, Na, rare earths, and actinides can be accommodated in titanite. Titanite is compatible with zirconolite but not with barium hollandite at ~1200°C. (24 refs.)

75093 Prediction of long-term leachability of a solidified radioactive waste from a short-term leachability test by a similitude law for leaching systems. C.Y.Hung (Office of Radiation Programs, US Environmental Protection Agency, Washington, DC, USA).

Nucl. & Chem. Waste Manage. (GB), vol.3, no.4, p.235-43 (1982). A similitude law for leaching systems has been developed on a one-dimensional mass transport theory which includes the processes of diffusion, sorption and radioactive decay. The similitude law can be used to determine the leaching characteristics of a solidified waste from a laboratory leaching test conducted for a similar test piece and to determine the long-term leaching characteristics of a test piece from the results of a short-term test. A leaching number developed from the similitude law was found to be the key parameter in characterizing leach test systems. A mathematical model based on one-dimensional transport theory was also developed to determine the general leaching characteristics of a solidified low-level radioactive waste in a test leachant. The results were normalized, based on the similitude law, in a leaching graph which uses the leaching number as a system parameter. The leaching number can be obtained through short-term leaching tests. The normalized leaching graph can be used to determine the leaching characteristics of a solidified waste without undergoing computer simulation or tedious numerical summations of infinite series. (16 refs.)

75094 Adsorption and stability prior to analysis of simulated nuclear waste leachate. H.M.Kingston, G.J.Lutz (Center for Analytical Chem., NBS, Washington, DC, USA).

Nucl. & Chem. Waste Manage. (GB), vol.3, no.4, p.245-9 (1982). Before analytical compositional analysis can be applied to the evaluation of the nuclear waste leachates, the credibility of the sample must be demonstrated. During the leaching in neutral to basic aqueous conditions the adsorption of metal ions onto the walls of the Teflon leach vessels was demonstrated. The adsorption was found to be variable for both zinc and neodymium. The resolubilization of zinc and neodymium using dilute nitric acid proved effective prior to analysis. Certain elemental groups represented by cesium, barium, and strontium demonstrated resistance to container adsorption during leaching under these conditions. The maintenance of a dissolved analytical sample was followed and demonstrated for at least seven weeks following the postleaching procedure. (8 refs.)

75095 Leachability of barium-radium sulphate sludges. P.M.Huck, B.Anderson (Dept. of Civil Engng., Univ. of Alberta, Edmonton, Alberta, Canada).

Nucl. & Chem. Waste Manage. (GB), vol.3, no.4, p.251-9 (1982). Presents results from the first phase of a research program designed to examine the leachability of radium-226 from barium-radium sulphate sludges. Bath leaching tests were performed. Results showed that liquid:solid contact time was relatively unimportant; radium in the sludge was stable in the presence of deionized water with a slight increase in the amount leached per gram of sludge occurring at higher liquid:solid ratios. Not unexpectedly, low and high values of leachant pH increased radium leaching. Both monovalent and divalent salt solutions also increased leaching; however, dissolved radium-226 activity levels in the leachate decreased as leachant molarity increased. For divalent salts this can be explained by the common ion effect; for monovalent salts it is opposite to results expected from solubility considerations. The interpretation of all results is complicated by the fact that in most tests, the amount of radium-226 present in the leachate was lower than the calculated contribution from the mother liquor present with the sludge. This apparent ability of the sludge to adsorb radium from solution may be related to dissolution and reprecipitation of the sludge during the leaching tests. (11 refs.)

75096 A fast configuration with a conjugate flux independent of energy. K.Fahrmann, E.Lehmann, G.Huttel, C.Reiche.

Yad. Energ. (Bulgaria), no.18, p.14-19 (1983). The existing configuration SEG-IV has been calculated to measure the effective cross-sections of absorption for structure-building materials. The configuration found in the ring reactor RRR is characterized with a conjugate flux, in the center, independent of energy. In this manner the absorption cross-sections of the different materials can be determined by the reactivities of small samples under identical conditions. (8 refs.)

75097 Data evaluation on the absorption of neutrons by cadmium with the aid of integral experiments. B.Bemer, K.Fahrmann, E.Lehmann.

Yad. Energ. (Bulgaria), no.18, p.20-6 (1983). A fast SEG-IV configuration containing Cadmium has been placed in the ring reactor at Rossendorf (RRR). The effects evaluated for the reactivity of pure scattering materials depend considerably on the cadmium data. In this manner by using comparisons with the respective experimental results, conclusions can be drawn for the existing group constants. Similar conclusions also follow from the determination of the energy dependence of the value function of the neutrons with the help of a neutron source. (8 refs.)

75098 Measurement of the effective cross-sections of absorption for fast reactor building materials using a fast configuration with a conjugated flux, independent of energy. K.Ditze, K.Fahrmann, D.Hedderich, G.Huttel, E.Lehmann.

Yad. Energ. (Bulgaria), no.18, p.27-33 (1983). The first measurements of the effective cross-sections of absorption for iron nickel and copper in the SEG-IV configuration have been described. Since in SEG-IV the spectrum of value (the separation potential) does not depend on the energy of the neutrons, the effects of the reactivity, measured with respect

to ^{10}B can be calculated as absorption cross-sections, averaged by the neutron spectrum. (15 refs.)

75099 An assessment of acoustic emission for nuclear pressure vessel monitoring. C.B.Scruby (Metall. Div., AERE, Harwell, England), H.N.G.Wadley.

Prog. Nucl. Energy (GB), vol.11, no.3, p.275-97 (1983). A critical review of the application of acoustic emission (AE) to the fabrication, proof testing and in-service monitoring of nuclear pressure vessels is presented. The detectability of deformation and fracture processes in pressure vessel steels is discussed, and recommendations made for improving source location accuracy and the development of quantitative source assessment techniques. Published data suggest that AE can make an important contribution to weld fabrication monitoring, and to the detection of defects in lower toughness materials during vessel proof testing. In high toughness materials, however, the signals generated during ductile crack growth may frequently be too weak for reliable detection. The feasibility of AE for continuous monitoring has not yet been adequately demonstrated because of high background noise levels and uncertainty about AE signal strengths from the defect growth processes that occur in service. In-service leak detection by AE shows considerable promise. (57 refs.)

75100 Tensile properties of 1.4970 austenitic stainless steel after corrosion caused by uranium dioxide and simulated fission products. L.Schafer, P.Hofmann (Inst. fur Material- und Festkörperforschung, Kernforschungszenstrum Karlsruhe, Karlsruhe, Germany).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.169-77 (April 1983). Flat tensile specimens of 1.4970 austenitic stainless steel were corroded at 650°C by UO_{2+x} to which the simulated fission products Cs, I and Te had been added. After corrosion, tensile tests were performed in air between 400 and 1000°C and strain rates between 0.005 and 50 mm/min. The different strengths of corroded specimens as compared to non-corroded specimens were correlated to the measured reaction zone thicknesses. To quantitatively describe the change in mechanical properties of the steel samples as a result of corrosion, a coefficient of effectiveness and a ductility factor were defined and determined as functions of the strain rate, the test temperature, the thermo-mechanical treatment, the simulated burnup, and the corrosion depth. It appears from the test results that the corrosion layer actually contributes to the strength of the corroded specimens. In some cases, however, an influence of the reaction zone on the uncorroded residual cross section of the specimens was observed. The ductility of the cladding material is always reduced by corrosion. (12 refs.)

75101 Irradiation effects on thermal conductivity of a light-water reactor pressure vessel steel. R.K.Williams, R.K.Nanstad, R.S.Graves, R.G.Berggren (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.211-15 (April 1983). A Mn-1/2 Mo-1/2 Ni steel (ASTM A533 grade B class 1) similar to the material used for construction of early pressurized water reactors was examined for irradiation-induced changes in thermal conductivity. The mechanical properties of this steel have been shown to be sensitive to irradiation. Testing of a standard sample in the range 30 to 90°C showed that the thermal conductivity measurements had an absolute uncertainty of about $\pm 3\%$. Results on the control and irradiated samples showed a small (1.7%) increase in thermal conductivity after irradiation at about 290°C to fluences up to $2.4 \times 10^{23} \text{ n/m}^2$ ($E > 1 \text{ MeV}$). Thus, for the neutron irradiation conditions investigated, the thermal conductivity of this pressure vessel steel is not degraded. (15 refs.)

75102 Influence of nonmetallic elements on the compatibility of structural materials with liquid alkali metals. K.Natesan (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.251-62 (April 1983). Liquid alkali metals such as sodium and lithium are being considered as heat-transfer media in liquid-metal cooled fast-breeder reactors and a tritium-breeding blanket in fusion reactor, concepts, respectively. In these applications, the interaction(s) of nonmetallic impurity elements in the liquid alkali metals, such as oxygen, carbon, nitrogen, and hydrogen, with structural materials is of concern. The author discusses purification methods for control of nonmetallic impurity elements in liquid sodium and lithium, and the limitations of the various methods. Interactions between structural metals and nonmetallic elements in liquid alkali metals are analyzed in terms of equilibrium distribution coefficients and the concentrations of nonmetallic elements in liquid alkali metals that are sufficient for compound formation with the structural metals. A number of experimental observations that describe various types of interactions are presented, and major differences in material behavior in liquid sodium and lithium environments are identified. (42 refs.)

75103 Stability of unirradiated BISO-coated carbon-containing UO_2 particles at elevated temperatures. S.Kashimura, K.Ikawa, K.Iwamoto (JAERI, Ibaraki, Japan), K.Sakanishi.

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.337-8 (April 1983). Presents the results of a similar out-of-pile heating experiment using BISO-coated C-containing UO_2 particles. Particles after heating were examined by means of X-ray microradiography and metallography. Description of BISO-coated particles used in the present experiment is given. Carbon content in the kernel measured by a coulometric method are also presented together with chemical phases detected by X-ray diffraction. (1 ref.)

75104 Computed tomographic methods for nuclear fuel characterization and safeguards. F.Levai (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.153-69 (1982). A research project is going on to explore the technical feasibility of examining large bundles of nuclear fuel using computed tomographic methods. The methods offer capability of measuring three-dimensional distribution of important nuclear parameters inside the fuel bundle (burnup data, safeguarding information etc.). Computed tomography either transmission or emission allows complete exclusion of section not under study. The section under examination is described by a two-dimensional function which represents the linear absorption coefficient in the case of transmission imaging or radioisotope concentration in the case of emission imaging. To investigate the feasibility of the method for transmission imaging fuel bundles, experimental apparatuses have been constructed and rod shaped demonstration bundles of the Training Reactor of the Bp. Technical University have been imaged and are demonstrated. In the case of emission imaging the same scanning pattern can be used as in the case of transmission. Objectives of the gamma scanning, choice of fission products are outlined. A two-dimensional gamma scanning procedure is developed as a possible method for emission imaging irradiated fuel bundle on the station side. (9 refs.)

75105 Refinement of boundary conditions in the calculation of close-packed lattices by the surface pseudosources method. N.V.Sultanov, I.A.Zhokina.

Sov. At. Energy (USA), vol.53, no.3, p.614-18 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.155-8 (Sept. 1982). [received: May 1983] In reactor calculations it is frequently necessary to solve the kinetic equations in square and hexahedral cells. As a rule these calculations are made in the Wigner-Seitz approximation, replacing the actual cell by a cylindricalized cell with an equal area. In close-packed lattices where the optical thickness of the moderator is less than one neutron mean free path, the details of the boundary conditions at the outside boundary of the cell begin to have a substantial effect on the integral characteristics of cells. By assuming isotropic reflection of neutrons at the outside boundary of a cell, the Wigner-Seitz approximation can be extended to the calculation of cells in close-packed lattices. (10 refs.)

75106 Gas release from uranium dioxide. V.Sh.Sulaberidze, A.V.Pershin. *Sov. At. Energy (USA)*, vol.53, no.3, p.619-21 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.158-60 (Sept. 1982). [received: May 1983] The working parameters of nuclear reactor fuel elements are such that an appreciable part of the fuel does not reach the temperature at which columnar grains are formed (1900-2000K). Under such conditions the level of gas release is not determined by the volume diffusion of gaseous fission products (GFP) in the fuel, but by other mechanisms. This is manifested in the change of the temperature dependence of gas release, a complication of the dependence of the relative yield of GFP radionuclides from the fuel on the radioactive decay constant. The authors determine the temperature dependence of gas release from compact uranium dioxide in the range 770-1700K for a burnup of up to 1% of the uranium atoms. The GFP yield from a fuel sample was studied by an in-pile method. The experimental arrangement consisted of an irradiation device with the sample and an open helium loop. Gas samples were analyzed with standard spectrometric apparatus using a (Ge)Li detector. Gamma spectra of ^{87}Kr , ^{88}Kr , ^{85m}Kr , ^{135}Xe , ^{133}Xe , and ^{138}Xe were identified. (6 refs.)

75107 Study of the deactivation mechanisms for some constructional steels by secondary-ion mass spectrometry. Yu.G.Bobrov, S.M.Bashilov, G.M.Guryanov, A.P.Kovarskii.

Sov. At. Energy (USA), vol.53, no.3, p.638-41 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.171-4 (Sept. 1982). [received: May 1983] Secondary-ion mass spectrometry SIMS has been used to examine the structure of the oxide films formed on 12Kh18N10T, 48TS, and 22K constructional steels under conditions simulating those in the first loop of boron-regulated pressurized water reactors type VVER-440, and also the changes in these films after processing with certain deactivating solutions. The concentration profiles were measured for the components of the alloys in the model films before and after chemical processing. (4 refs.)

75108 Preparation and certification of a uranium reference material. R.G.Hansen, E.J.Ring.

Report M84, Council for Miner. Technol., Randburg, S. Africa (25 Feb. 1983), 8 pp.

This report describes the preparation, analysis, and certification of a bulk sample of low-grade uranium ore for use as a reference material. An investigation into its state of radioactive equilibrium established that the material is suitable for the purpose for which it is primarily intended, i.e. the calibration of radiometric sorting equipment on mines. Eleven South African laboratories, using several well-established analytical techniques, contributed data on the uranium content of the material. (3 refs.)

75109 Investigation of inhomogeneity in ceramic reactor materials using laser-localized emission spectroscopy. R.Siechau, M.Mazurkiewicz, H.Nickel. **Report JUL-1834**, Kernforschungsanlage, Jülich, Germany (March 1983), 148 pp. In German.

Using laser-localized emission spectroscopy, a method has been developed for the determination of elemental inhomogeneity within the grains of three coarse-grained ceramic materials—the mullite-based Duritals M70 and E90 and the silica-based Masrock. The method had to be optimized to allow an acceptable detection of the elements to be analyzed in spite of the small quantities of evaporated material. A laser-produced crater of 100 μm diameter and depth was found to be necessary to produce the required amount of evaporated material, 0.5 to 0.7 μg depending on the material composition. (85 refs.)

75110 Fracture mechanics tests in static and cyclic loading conditions on structure graphite for high temperature reactor plants. W.Thiele, W.Delle, F.Schubert, H.Nickel.

Report JUL-1831, Kernforschungsanlage, Jülich, Germany (March 1983), 102 pp. In German.

Fracture mechanics tests have been carried out on nuclear reactor graphites manufactured by extrusion or by vibration moulding. In addition to the measurement of fracture toughness in static tests, cyclic tests with a sinusoidal load in the range for pulsating tensile stresses were carried out. The crack propagation rate was determined as a function of the stress intensity factor range. The anisotropic fracture behaviour observed in both static and cyclic tests was correlated with the anisometrical form of the pores identified during the investigation of the graphite morphology by means of the quantitative image analysis. (79 refs.)

75111 Problems in modelling the transport of material from deep-sea dumpsites. G.T.Needler (Bedford Inst. of Oceanography, Dartmouth, Nova Scotia, Canada).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.33

The assessment of the hazard to man and the environment from deep-sea dumping requires estimates of the transport of contaminants from a dumpsite to a point of potential impact. Considering the nature of our knowledge of the marine environment, the construction of a single complex model for a wide variety of purposes is not only difficult but usually inappropriate. Simple models consistent with our knowledge of the dominant oceanic processes and tailored to particular needs will usually be more reliable. Selection of an appropriate simple model however requires considerable care. For example, collection dose assessments may require models giving accurate average distributions, but this may only be attainable at the expense of spatial and temporal resolution. On the other hand, critical path assessments require models maximizing specific pathways and such models in general yield inaccurate averages. Estimation of extreme but rare events is usually particularly difficult. (no refs.)

75112 The effects of radiation exposure on aquatic organisms. A.D.Woodhead, R.B.Setlow (Biology Dept., Brookhaven Nat. Lab., Upton, NY, USA).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.135-6

The use of oceans as sinks for disposal of radioactive wastes involves risks to the marine biota, and indirectly to humans through the food chain. The present contribution is principally concerned with the first aspect of this problem, the somatic and genetic effects of accumulated radionuclides upon fish and other aquatic organisms. The authors begin by presenting a brief review of the information on radiation effects from a range of field and laboratory studies, including recent data from marine animals captured in the wild, which identify and estimate the accumulation of physiologically important radionuclides in different tissue and organs after exposure to low-level contamination for prolonged periods. Much of this information was derived from populations living in the vicinity of nuclear power stations located on ocean coasts, estuaries and rivers, although some data are available from fish living in the open sea. There are a few experimental studies in which fish have been kept in water containing radionuclides; some of these studies have shown changes in the distribution of radionuclides within fish during growth. (no refs.)

75113 Studies of the radiosensitivity of deep-sea bacteria. A.A.Yayanov (Scripps Inst. of Oceanography, Univ. of California, San Diego, La Jolla, CA, USA), L.S.Gomez, R.Van Bostel, A.S.Dietz.

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.137

Experiments on the sensitivity of the colony forming ability (CFA) of deep-sea bacteria to an external source of gamma rays from ^{60}Co are described. The bacteria were grown at 2°C and at the pressure of their depth of origin. The bacteria were irradiated either suspended in artificial seawater or immobilized in nutrient gels. The irradiations were done at 0°C either at atmospheric pressure or at the pressure of the depth of origin of the bacteria. The effect of irradiation was assessed by determining the ability of each cell in the irradiated population to form colonies in nutrient gels incubated at 2°C at the pressure of the depth of origin of the bacteria. The radiation dose was determined with the ferrous sulfate dosimeter. Among the conclusions are that the CFA of deep-sea bacteria is slightly more sensitive to gamma rays than is the CFA of shallow water bacteria; and, that this sensitivity is slightly correlated with depth of origin. The significance of the data on radiosensitivity to the disposal of radioactive wastes is discussed. (no refs.)

75114 Effect of radiation on sister chromatid exchanges and chromosomal deletions in the benthic worm *Neanthes arenaceodentata*. F.L.Harrison, D.W.Rice, M.E.Varela (Environmental Sci. Div., Lawrence Livermore Nat. Lab., Livermore, MA, USA).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.138-9

Disposal of low-level, solid radioactive wastes in marine environments occurred on both the east and west coasts of the United States. Although these practices were discontinued by 1970, little effort was made until recently to determine the fate and distribution of the radionuclides released from these wastes. Information now available indicates that some leakage of radioactivity occurred, but the total impact of the releases on the ecosystems is not known. Traditional bioassay systems are unsuitable for assessing sublethal effects from ocean disposal of low-level radioactive waste, where mortality and phenotypic responses are not anticipated at the expected, low environmental disposal levels. The authors have examined the usefulness of SCE induction as a measure of low-level radiation effect in a sediment-dwelling marine worm, *Neanthes arenaceodentata*. This exchange does not alter the overall chromosome morphology and appears to be a sensitive indicator of DNA damage caused by environmental mutagens. (no refs.)

75115 Radioactive contamination of the marine environment, uptake and distribution of tritium and technetium in *Acetabularia* and other marine algae. G.Arapis, A.Bossus, G.Nuyts, P.Mathot, J.Collard, G.Gerber, R.Kirschmann, M.Cogneau, S.Bonotto (CEN/SCCK, Mol, Belgium).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.140-2

The giant unicellular marine alga *Acetabularia acetabulum* has been used to study the fate of tritium administered in the form of tritiated water or of tritiated organic compounds. It has been found that tritiated water is rapidly taken up by the algae and is lost almost as rapidly. Three metabolic components can be discerned in release, one representing about 40% of the total with a half-life of a few seconds, a second one (about 50%) with a half life to about 1 min, representing probably water in the vacuole and a third (about 1.6%) with a half-life of about 5 hours. Incorporation of tritium into organic matter was studied by exposing the algae to tritiated water for a period of more than two weeks. Similar experiments have also been conducted using technetium as the pollutant. (no refs.)

75116 The role of biogenic debris in the vertical transport of transuranic wastes in the sea. N.S.Fisher, S.W.Fowler (IAEA, Lab. of Marine Radioactivity, Oceanographic Museum, Monaco).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.143-4

Sinking biogenic particulate matter in the sea has been shown to contain elevated levels of various types of pollutants, including radionuclides, heavy metals, chlorinated hydrocarbons and other organic contaminants. Thus, fall-out levels of plutonium and americium, for example, in zooplankton fecal pellets (70-100 pCi kg^{-1} dry wt.) are significantly higher than that in either the organism that produced them (0.4 pCi kg^{-1} dry wt.) or the food which zooplankton ingest (3-4 pCi kg^{-1} dry wt.). Using transuranic elements as model pollutants it is possible to quantitatively describe biologically mediated processes which affect the distribution of wastes discharged to surface waters. (no refs.)

75117 Comparative behavior of plutonium and americium in the Equatorial Pacific. V.E.Noshkin, K.M.Wong, T.A.Jokela, J.L.Burnk, R.J.Eagle (Lawrence Livermore Nat. Labs., Univ. of California, Livermore, CA, USA).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.145-8

To make reasonable predictions of the environmental behavior of disposed radioactive wastes in the deep ocean, it is useful to study contaminated sites where many of the processes, reactions, and rates that influence the fate of specific long-lived radionuclides can be identified and studied. The authors have previously studied the rate at which plutonium radionuclides are released from sedimentary deposits to the water column at Bikini and Eniwetak

Atolls. These atolls, site of the Pacific proving grounds, were contaminated with fission and activation products during nuclear device testing by the United States between 1946 and 1958. Long-lived radionuclides generated still persist in the atoll aquatic environment. Here they extend their description of the behavior of plutonium in the Equatorial Pacific (within and outside Bikini and Enewetak Atolls) and discuss the comparative chemistries and biological accumulation of plutonium and americium isotopes. Similarities exist among the aquatic characteristics and behavior of these transuranics at Enewetak and Bikini and at other sites contaminated by different sources. Unexplained differences are also noted, which indicates that one cannot yet confidently predict the universal aquatic behavior of the transuranics. (no refs.)

75118 The influence of diagenetic redox reactions on the distribution of $^{239,240}\text{Pu}$, ^{137}Cs , ^{241}Am and ^{55}Fe in sediments of the US continental margin. F.L.Sayles, H.D.Livingston (Woods Hole Oceanographic Instn., Woods Hole, MA, USA).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.149-50

In view of the potential influence of diagenesis and redox state upon sediment-radioisotope associations, the authors have carried out a study of the relationship between the sedimentary distributions of several fallout nuclides and recognizable diagenetic redox reactions in marine sediments. The studies have taken place on transects of the eastern and western continental margins of the US distributions of $^{239,240}\text{Pu}$, ^{241}Am , ^{137}Cs and ^{55}Fe have been measured on a number of cores. The pore water chemistry of the sediments also has been characterized as regards trace metals, nutrients and other parameters required to define diagenetic redox zonation. (no refs.)

75119 Behavior of long-lived nuclides associated with radioactive wastes in the deep-sea. S.R.Aston, S.W.Fowler (IAEA, Lab. of Marine Radioactivity, Oceanographic Museum, Monaco).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.151-2

Over the last two years a programme of research has been developed in relation to some aspects of the behavior of long-lived radionuclides associated with the deep-ocean disposal of radioactive wastes. Particular emphasis has been placed on the interactions of transuranic nuclides and technetium with sediments from existing or proposed dumpsites in the Atlantic and Pacific Oceans. Results are presented for experimental studies on the rate of adsorption, equilibrium K_d values and desorption of these radionuclides with sediments. Examples are shown of the experimental uptake of these nuclides by benthic infauna, and the transfer factors and tissue distributions reported. Comparative results for uptake from seawater and dumpsite sediments are presented and discussed. (no refs.)

75120 Development of an ocean model for use in radiological assessments of sea disposal of solid radioactive wastes. S.F.Mobbs (Nat. Radiological Protection Board, Chilton, England), P.A.Gurbutt, M.D.Hill, J.G.Shepherd, P.Killworth.

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.153-5

One of the principal objectives of a radiological assessment of a radioactive waste disposal practice is the calculation of the doses which may be received by man, both individually and collectively. Since these doses will, in the case of most disposal practices, be received over periods of the order of millions of years in the future it is necessary to develop models to predict the dispersion of radionuclides in the environment and their eventual pathways to man. In the case of disposal in the sea these models need to describe the important processes governing the distribution of radionuclides throughout the ocean, the sediments (both bed sediments and coastal sediments) and in marine biota. (no refs.)

75121 Equipment for 3-dimensional measurements of natural and artificial tracers in the sea. H.Appelquist, P.B.Nielsen (Danish Isotope Centre, Copenhagen, Denmark).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.156-7

The Danish Isotope Centre has developed a data acquisition system to be used for dispersion and transport measurements in connection with waste disposal in the sea. The system consists of a preliminary computer developed by DIC, interfaced to the subsea detectors and the electronic navigation system. The primary computer has 8 digital input and output channels, 16 analog input channels and 10 output channels. It has a counter input for radioactivity detector and a RS-232 out/input for transmission to the HP 9825 desktop computer. The system for the moment is working with one radioactivity detector, two in-situ fluorimeters, thermistor and conductivity cells, echo sounder and Decca Navigator. Spare channels are applied for control of sensors in- and output voltages, but can be applied for alternative sensors as oxygen probes. (no refs.)

75122 Relationship between the distribution of radionuclides and the sedimentological and mineralogical traits of the coastal marine sediments (Gaeta, Latina, La Spezia, Italy). A.Broni, O.Ferretti, C.Papucci (Comitato Nazionale per l'Energia Nucleare, Rome, Italy).

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.158

Geomorphological, sedimentological and mineralogical studies are being conducted by the Comitato Nazionale per l'Energia Nucleare (CNEN) on the Italian coasts with the aim of finding possible correlations between the distribution of some radionuclides and these ground environmental parameters. Alluvial sediments have been examined and geological and cartographic data have been interpreted according to this framework. (no refs.)

75123 The NEA research and environmental surveillance program related to sea disposal of radioactive waste. P.Gurbutt (Fisheries Lab., Ministry of Agriculture, Lowestoft, England), W.Templeton, B.Ruegger.

Fourth International Ocean Disposal Symposium, Plymouth, Devon, England, 11-15 April 1983 (Plymouth, Devon, England: Plymouth Polytechnic 1983), p.159-60

Sea dumping operations of certain types of packaged low- and medium-level radioactive wastes have been carried out since 1967 in the North-East Atlantic under the auspices of the OECD nuclear energy agency. Since 1977 these operations are organised according to the requirements of the Multilateral Consultation and Surveillance Mechanism for Sea Dumping of Radioactive Waste established in conformity with the London Convention by the OECD Council. On the occasion of the 1980 review of the continued suitability of the North-East Atlantic site used for the disposal of radioactive waste, it was recommended that an effort should be made to increase the scientific data base relating to the oceanographic and biological characteristics of the dumping area. In particular, it was suggested that a site specific model of the

transfer of radionuclides in the marine environment be developed which would permit a better assessment of the potential radiation doses to man from the dumping of radioactive waste. To fulfil these objectives a research and environmental surveillance program related to sea disposal of radioactive waste was set up in 1981 with the participation of eleven member countries and the International Laboratory for Marine Radioactivity of the IAEA in Monaco. (no refs.)

75124 Proposed Department of Energy design and operations criteria for low-level radioactive waste disposal sites. H.D.Williams, K.L.Falconer, A.E.Grey (Nat. Low-Level Waste Management Program, EG&G Idaho, Idaho Falls, ID, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.15-26

It is the policy of the Department of Energy that operations under its authority which involve generation and disposal of low-level radioactive waste are conducted in a manner which assures that radiation exposure to employees and the public comply with the requirements of DOE Order 5480.1. To implement this policy, EG&G Idaho Inc., as the lead contractor to the Department of Energy's Low-Level Waste Management Program, initiated an effort in the fall of 1980 to develop criteria pertinent to the shallow land burial of low-level radioactive waste. Shallow land burial activities were divided into site selection, site design, site operation, waste acceptance, site closure/post-closure, and corrective actions. Criteria for each of the six areas were developed by a committee process. (no refs.)

75125 Lessons learned about disposal design. O.I.Oztunali (Dames & Moore, White Plains, NY, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.27-37

Presents a historical perspective on disposal facility design and its implementation (practices) in the US in view of the proposed 10 CFR Part 61 and the systems analysis approach recommended to achieve the performance objectives. Disposal facility design and practices are extremely important components of the systems approach to achieving the performance objectives since they can be controlled with a greater degree of confidence than some of the other components of the system. The predictability requirements of the proposed rule (i.e. the demonstration that the performance objectives are met) can most clearly be achieved if the license application relies heavily on components that can be controlled with confidence. An introduction amplifying the above concepts is presented first; this is followed by a recounting of several past disposal design related issues that influenced the formulation of 10 CFR Part 61 significantly. Lessons learned about disposal design and a discussion follow. (4 refs.)

75126 Trench design and construction techniques for low-level radioactive waste disposal. P.G.Tucker (Geotech. Lab., US Army Engineer Waterways Experiment Station, Vicksburg, MS, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.39-43

Problems encountered with the disposal of low-level radioactive waste by shallow land burial have brought about the realization that a reevaluation of disposal trench design and construction techniques is needed. Subsidence, the 'bathtub effect', and the infiltration of groundwater into the disposal trench are among the problems that have cast doubts on the ability of some facilities to control the movement of their buried radionuclides. They have also made the goal of total passive maintenance unattainable in the near future. The Nuclear Regulatory Commission and the US Army Corps of Engineers, Waterways Experiment Station (WES) have entered into an agreement whereby the WES is preparing a document which will detail the critical parameters involved with the design and construction of low-level radioactive waste disposal trenches. These parameters will include those which should be controlled through the issuance of specifications or license restrictions in order to ensure that the facility will function as expected. The author outlines the scope of the work, the work accomplished to date, the work remaining, and the basic philosophy behind the approaches taken in the preparation of this document. (no refs.)

75127 A conceptual facility designed for remedial action wastes. A.K.Phelps (Nuclear Fuel Operations, Bechtel Nat. Inc., Oak Ridge, TN, USA), M.G.White.

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.45-65

Presents two conceptual designs for below-grade land disposal in the Northeastern United States for remedial action wastes from the DOE Formerly Utilized Sites Remedial Action Program (FUSRAP). The wastes were generated by programs of the Manhattan Engineer District/Atomic Energy Commission (MED/AEC). These materials are largely trace-contaminated soils, sediments, and rubble resulting from a variety of activities, including research, processing, and storage of uranium and thorium ores and concentrates. The principal isotope of interest from a hazards control standpoint is radium-226. (5 refs.)

75128 Surface water considerations in facility design and operation. D.L.Schreiber (Schreiber Consultants Inc., Coeur d'Alene, ID, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.73-91

Surface water hydrology considerations are discussed for the design and operation of commercial low-level radioactive waste disposal facilities. Guidelines are recommended and bases presented for several hydrologic engineering factors, such as design flood flows, debris flows, erosion control, and water management, that must be accounted for in facility design and operation. Surface water hydrology practices at existing low-level radioactive waste disposal facilities are reviewed and compared with the recommended guidelines. Finally, the potential restrictiveness of the recommended guidelines is evaluated. (15 refs.)

75129 Operational practices to facilitate closure of low-level waste disposal facilities. G.L.DePoorter (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.93-100

Final closure of a low-level waste disposal facility must be considered during most of the phases in the life cycle of the facility. The author enumerates the

reasons for considering the closure of a low-level waste disposal facility during the operation, closure, and postclosure observation phases in the life of the cycle of the facility. Actions required during the preoperational, operational, and closure phases that will facilitate closure are discussed by using example trench configurations for an arid site and for a humid site. Performance criteria for the closed site are discussed in terms of the information required to predict site performance and the operating practices necessary to ensure that this desired and predicted performance is obtained. Activities that must be considered include initial site characterization, site design and lay out, site construction, waste from acceptance criteria, waste handling and trench capping and suitable vegetation. (no refs.)

75130 Land disposal technique for hazardous and low-level radioactive waste containment and encapsulation of hazardous waste disposal sites. A.A.Metry, M.H.Corbin (Roy F. Weston Inc., West Chester, PA, USA). Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.101-30

This is based on several projects where hazardous waste and low-level radioactive waste was deposited on and below the surface. The primary objective of these projects was to develop stabilization and containment concepts for isolation of those waste materials and preventing potential migration of toxic and radioactive substances into the environment. Several concepts and control options are presented. These included: chemical fixation, grouting, bentonite slurry barrier, hydrogeologic isolation, impermeable covers and liners, ion exchange barrier, etc. A discussion of conceptual design methodology, modeling and simulation techniques, discussion of case history results, cost and economic information, and major program implementation features, is included. (10 refs.)

75131 Environmental monitoring considerations for low-level waste disposal sites. J.Sedlet (Argonne Nat. Lab., Argonne, IL, USA). Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.131-50

An adequate monitoring program consists of measuring concentrations of radionuclides, chemically-toxic substances, and leachate indicators in environmental media and of evaluating specific physical properties of the site. In addition, the composition of the buried waste must be known. Methods for obtaining this information are discussed and monitoring programs are presented for the preoperational, operational, and postclosure phases of a disposal site. Environmental monitoring is considered in a broad context, since it includes monitoring burial trenches onsite, as well as surveillance in the offsite environment. Postclosure monitoring programs will be strongly influenced by the operational monitoring results. The results of the environmental monitoring program will be vital to successful site operation. These results should be used to determine if operational changes are needed and to predict future environmental impacts. (25 refs.)

75132 Health physics monitoring practices at commercial low-level waste disposal sites in light of 10 CFR 61 requirements. D.E.Hadlock, R.L.Gilchrist, C.D.Hooker, W.N.Herrington (Pacific Northwest Lab., Richland, WA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.151-9

The importance of maintaining occupational radiation exposures 'As Low as Reasonably Achievable' (ALARA) is recognized and emphasized in 10 CFR 61 (Licensing Requirements for Land Disposal of Radioactive Waste) and the supporting implementing regulations. To ensure that current and future exposures are ALARA, the Nuclear Regulatory Commission contracted with the Pacific Northwest Laboratory (PNL) is operated for DOE by Battelle Memorial Institute) to: (1) evaluate current health physics practices at the low-level waste (LLW) sites of Barnwell, South Carolina, Beatty, Nevada, and Hanford, Washington; (2) write a manual of good practices for LLW sites; and (3) review the findings of the site appraisals as they apply to 10 CFR 61. (5 refs.)

75133 Light-water reactor low-level waste forms. B.D.Guilbeault (Engng. Div., NUS Corp., Gaithersburg, MD, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.161-75

In the proposed 10 CFR Part 61, 'Licensing Requirements for Land Disposal of Radioactive Waste', three waste-classification groups for low-level waste are identified. This classification system is based on the radionuclide inventory. The category into which a waste falls determines the requirements for its disposal. With light-water reactor waste, the concentration of some radionuclides can be easily determined through routine analytical methods; however, some radionuclides are impractical to measure. Numerous past studies have characterized the physical waste form and have looked at the easily determined radionuclides. The author reviews the physical waste forms, outlines where analytical information is currently available and/or easily obtainable, and discusses what further information on radionuclide concentrations is needed to meet the requirements of 10 CFR 61. The author also discusses the possible changes in the waste form due to the increased emphasis of volume reduction and finally, several areas that will need to be addressed in the future. (no refs.)

75134 12 years of experience of shallow land disposal of low and intermediate level radioactive waste in France. F.Van Kote (CEA, Paris, France).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.177-200

In France, the long term industrial management of radioactive waste is handled by a national agency, the Agence Nationale pour la Gestion des Dechets Radioactifs (ANDRA) created in 1979 within the French Atomic Energy Commission (CEA). The French organization of radioactive waste management and ANDRA's work schedule and policy are briefly outlined. The solution adopted in France to dispose of low and intermediate activity level short lived waste (LLW and ILW) is shallow land burial at the Centre de la Manche which has been set in operation in 1969. The safety basic principles and technical options adopted for shallow land are reviewed then the different steps of waste management at the Centre de la Manche are described. Finally, the main conclusions drawn from the twelve years' experience gained at the Centre de la Manche are detailed. (no refs.)

75135 NRC's perspective on acceptability and approval of new techniques. E.F.Hawkins (US Nuclear Regulatory Comm., Washington, DC, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.211-22

Subpart D of the proposed 10 CFR Part 61 provides the technical requirements for land disposal of low-level radioactive wastes. Within the Subpart, the sections on site suitability (61.50), site design (61.51), and facility operation and site closure (61.52) have been oriented toward near-surface disposal, with subsections reserved for methods other than near-surface disposal. The orientations toward near-surface disposal reflects the current status and level of experience with low-level radioactive waste disposal and reflects the type of disposal facility the staff anticipates in most new license applications. The NRC's attitude towards alternative or new disposal techniques is discussed. (no refs.)

75136 Overview of low-level radioactive waste disposal facilities subsidence. R.L.Kahle, J.Rowlands (Ralph Stone & Co. Inc., Los Angeles, CA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.223-52

The results of a case study of the Sheffield, Illinois, waste disposal facility, and literature reviews on problems at waste disposal facilities are presented. The types of problems, causes of the problems, and approaches to mitigate the problems are evaluated. The problems identified were surface subsidence, surface erosion, leachate and gas. Leachate resulted from water entry into trenches where subsidence occurred. Subsidence was attributed to random placement of waste containers into trenches leaving voids. The poorly compacted cover soil initially bridged the voids and subsequently collapsed and siphoned into the voids. Surface potholes and slumps resulted. Extensive potholing occurred during and after precipitation when the Sheffield loess soil piped into the voids. Long-term soil consolidation also resulted in area settlement. The approaches evaluated for trench stabilisation are discussed. (11 refs.)

75137 Waste form and its role in trench stability. D.G.Schweitzer (Dept. of Nuclear Energy, Brookhaven Nat. Lab., Upton, NY, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.253-60

NRC supported programs evaluating past and present performance of shallow land burial sites and programs developing technical criteria for disposal of low-level waste in shallow land burial facilities provide convincing evidence of the importance of the waste form in providing trench stability. A summary is given of past problems in shallow land burial sites resulting from degradable waste and resultant trench subsidence. Programs supporting the technical justification for the proposed requirements on waste, waste forms and high integrity containers carried out at BNL indicate the requirements necessary to assure safe isolation of low-level waste in shallow land burial sites. (9 refs.)

75138 Waste emplacement and closure techniques. L.W.White (Golder Associates, Ellicott City, MD, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.261-7

Past practices in the disposal of low level radioactive waste have been to randomly place waste packages into trenches to within one meter of the ground surface. The major factors that have determined past practices have been cost and the need to protect workmen from unacceptable radiation exposure. Experience has shown that such practices have led to expensive maintenance problems and difficulty in developing acceptable decommissioning schemes. There are a number of waste emplacement and closure techniques that could reduce long term institutional commitments to maintain the integrity of the site. Practical and relatively inexpensive ways of bounding the problem of trench fill subsidence and subsequent problems of trench cap and site stability are proposed. (no refs.)

75139 Overview of design considerations for effective trench covers. R.Skryness (Geotech. Div., Stone & Webster Engng. Corp., Boston, MA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.277-88

The siting, design, and operation of low-level radioactive waste disposal facilities are directed toward the isolation of waste. Trench covers are an integral part of the site's surface water control plan and function with other elements of disposal site to reduce surface water infiltration, and contribute to overall isolation of the buried waste. Attributes of a good cover design include constructibility, utilization of readily available materials, cost effectiveness, long-term reliability, and low maintenance. Thorough knowledge of the site's environmental, geological, and hydrological conditions, and familiarity with the proposed site layout, site development sequence, and disposal operations are important prerequisites for effective trench cover design. In the final analysis, trench cover performance depends on the successful implementation of the construction design and the cover's compatibility with trench geometry, site conditions, disposal operations, and the overall surface water control plan. (no refs.)

75140 Biological intrusion barriers for large volume waste disposal sites. T.E.Hakonson (Los Alamos Nat. Lab., Los Alamos, NM, USA), J.F.Cline, W.H.Rickard.

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.289-308

Intrusion of plants and animals into shallow land burial sites with subsequent mobilization of toxic and radiotoxic materials has occurred. Based on recent pathway modeling studies, such intrusions can contribute to the dose received by man. The authors describe past work on developing biological intrusion barrier systems for application to large volume waste site stabilization. State-of-the-art concepts employing rock and chemical barriers are discussed relative to long term seviceability and cost of application. The interaction of bio-intrusion barrier systems with other processes affecting trench cover stability are discussed to ensure that trench cover designs minimize the potential dose to man. (29 refs.)

75141 An investigation of layered covers designed to limit infiltration at waste disposal sites. T.M.Johnson, B.L.Herzog, K.Cartwright, T.H.Larson (State Geological Survey Div., Illinois Dept. of Energy & Natural Resources, Champaign, IL, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.309-24.

Layered soils of highly contrasting texture have been shown to act as a barrier to infiltration because of differences in unsaturated hydraulic properties. Water infiltrating into a fine-grained soil overlying an unsaturated gravel will not enter the gravel until the overlying material is nearly saturated. As a result of what is commonly called the 'wick effect', moisture will flow laterally through the fine-grained soil above the gravel layer. Layered covers of compacted soil materials utilizing this phenomenon have been proposed to limit infiltration at waste disposal sites. Laboratory column experiments using a dual-gamma ray attenuation system to measure moisture content and density simultaneously have been used to observe the behavior of layered soils and to select materials for field testing. Currently underway are field-scale studies of alternative cover designs selected on the basis of two-dimensional modeling. (14 refs.)

75142 An application of soil arch and soil beam concepts to the construction of shallow land burial trench covers. E.A.Nowatzki, J.G.McCray (Univ. of Arizona, Tucson, AZ, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.325-42.

Reports on an investigation in which three different trench cap designs were developed and prototype trenches constructed in two different climatic environments to test the adequacy of the designs. The basic concept underlying each of the designs is that trench cap performance could be improved if the cap were stabilized in some way. In one design, controlled compaction alone was used to achieve high levels of in situ density. In another design, the emplacement of a strip of reinforcing geotextile in addition to controlled compaction was used. The third design incorporated a 'soil beam' into the cap in addition to controlled compaction. A soil beam is a structural member constructed of compacted soil surrounded by an overlapping sheet of geotextile. Underlying each of these designs is the concept of a 'soil arch'. Under proper conditions, soil has the ability to arch itself over small voids within the soil mass with little or no deformation at the surface. In order to test this concept and to evaluate the relative merits of the three designs, a system of settlement plates was installed at various levels in the caps. These settlement plates were monitored during and after construction so that absolute and relative displacements could be determined within a given trench. Difference in behavior among the three trenches could also be observed in this way. (5 refs.)

75143 Alternatives to shallow land burial of low-level radioactive waste—an overview. J.L.Ellis (Gilbert/Commonwealth, Reading, PA, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.347-64.

The alternatives to shallow land burial for disposal of low level radioactive waste are identified and a brief description of each concept is provided. The alternatives can be categorized as follows: near term isolation concepts, far term isolation concepts, dispersion concepts, and conversion concepts. The more promising near term isolation concepts are discussed in terms of advantages and disadvantages geological/environmental parameters, information/technology development requirements, and operational features. (24 refs.)

75144 Intermediate-depth burial of low-level wastes. V.C.Rogers, J.A.Adam (Rogers & Associates Engng. Corp., Salt Lake City, UT, USA).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.365-77.

Intermediate depth burial is an alternative disposal method for those radioactive wastes that cannot be disposed in a traditional shallow land burial facility. In general, the environmental risks from surface intrusion events limit the radionuclide concentrations in wastes appropriate for near-surface disposal. The magnitude of these risks as well as the likelihood of a surface intrusion event are generally reduced as the depth of disposal increases. Therefore, many wastes exceeding Class C limits can be disposed safely at depths exceeding those for near-surface disposal, but which are significantly less than depths for deep geologic disposal. However, in considering intermediate depth burial, care should be taken to avoid significant increases in risks from other pathways such as migration in groundwater. Examples of intermediate depth burial are presented, along with cost comparisons to shallow land burial. (12 refs.)

75145 Predictability of solute transport in diffusion-controlled hydrogeologic regimes. R.W.Gillham, J.A.Cherry (Dept. of Earth Sci., Univ. of Waterloo, Waterloo, Ontario, Canada).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.379-410.

Hydrogeologic regimes that are favourable for the subsurface management of low-level radioactive wastes must have transport properties that will limit the migration velocity of contaminants to some acceptably low value. Of equal importance, for the purpose of impact assessment and licensing, is the need to be able to predict, with reasonable degree of certainty and over long time periods, what the migration velocity of the various contaminants of interest will be. The authors present arguments to show that in addition to having favourable velocity characteristics, transport in saturated, diffusion-controlled hydrogeologic regimes is considerably more predictable than in the most common alternatives. The controlled and saturated-diffusion-controlled environments are compared, with particular consideration being given to the difficulties associated with the characterization of the respective transport parameters. (25 refs.)

75146 Canadian experience with the storage and disposal of low- and intermediate-level wastes. M.A.Feraday (Chalk River Nuclear Lab., AECL, Chalk River, Ontario, Canada).

Proceedings of the Symposium on Low-Level Waste Disposal. Vol.3. Facility Design, Construction, and Operating Practices (NUREG/CP-0028), Washington, DC, USA, 29-30 Sept. 1982 (Oak Ridge, TN, USA: Oak Ridge Nat. Lab 1982), p.411-29.

In Canada, large quantities of low- and intermediate-level radioactive solid waste arise from nuclear power reactors and research sites, fuel and radioiso-

tope production facilities and from many medical and industrial applications. Currently storage after volume reduction is being used as a safe way of managing these wastes for many years at a reasonable cost. Since permanent disposal has many advantages, disposal technologies including waste processing and characterization, site characterization, repository design and safety assessment are being developed. The preferred disposal strategy is one matching waste fractions, segregated according to hazardous life-time, with disposal concepts which can isolate wastes for the required period. Several possible disposal concepts are discussed. (18 refs.)

75147 Microwave-assisted solidification of free-falling radioactive droplets. E.Bonek (Inst. fur Nachrichtentech., Tech. Univ. Wien, Wien, Austria), K.Knotik, P.Leichter, G.Magerl, L.Rohrecker. Arch. Elektron. & Uebertragungstechnik. (Germany), vol.37, no.5-6, p.222-8 (May-June 1983).

Reports on the design and on the operation of a 14-GHz microwave system which heats droplets (2 to 4 mm diameter) of aqueous radioactive mixtures from 5°C to 100°C within 0.25 s during free fall. Additional, untreated free fall of 1 s turns the droplets to homogeneous, spherical particles of uniform size which are used in the production of high-temperature-reactor nuclear fuel. A square cross-section H₁₀₀ cavity, positioned vertically, with optimized dimensions is fed with 90 W CW power and serves as an applicator. The problem of nonuniform heating of high-loss spherical droplets is treated in depth. (9 refs.)

75148 Carbothermic synthesis of plutonium mononitride from the dioxide. Y.Suzuki, Y.Arai, T.Sasayama (Div. of Nuclear Fuel Res., JAERI, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.331-3 (April 1983). A study was conducted in order to obtain detailed information on the carbothermic synthesis of pure PuN from PuO₂, for which only limited information is available. (7 refs.)

28.43 FISSION REACTOR OPERATION

75149 A method of state equation decomposition and its application to the simulation of the dynamics of the active zone of the VVER reactor. C.Karpeta, S.Roubal.

Automatizace (Czechoslovakia), vol.26, no.4, p.91-4 (April 1983). In Czech. Describes a method of numerical integration suitable for solving a system of nonlinear differential equations. The method is based on the decomposition of a linearised state equation into a fast and slow part. A program named ISSY for the decomposition and the numerical integration has been written in FORTRAN for the Odra computer. Application of the method described to the simulation of the dynamic properties of the active zone of the VVER reactor with the aim of carrying out nuclear power station analysis is described. In comparison with the classical Runge-Kutta method, the method described features higher speed and large range of numerical stability. (4 refs.) E.D.

75150 Simulation of neutron transmission by fission nuclei in the region of unresolved resonances. N.T.Kojumdzieva, N.B.Janeva. *Yad. Energ. (Bulgaria)*, no.18, p.34-9 (1983).

A procedure for the theoretical description of the transmission T_t and T_r for each energy and all thicknesses in the region of unresolved resonances in the interaction with S-neutrons has been presented on the basis of the statistical matrix of the collisions. The program of the procedure has been described. The program has been applied to the processing of the experimental results obtained in Dubna on the IBR-30. (6 refs.)

75151 Neutron-physical characteristics of a standard fast neutron reactor. J.D.Jordanov, N.A.Antonov.

Yad. Energ. (Bulgaria), no.18, p.49-56 (1983). The investigation of standard test reactors with fast neutrons makes possible the comparison of the different libraries of nuclear data and the various program set-ups for neutron physical analysis of fast neutron power reactors. Three versions of a model reactor of this type of sodium cooled power reactor, are considered. A program for the reliable calculation of the more important characteristics of such a reactor has been developed. The original library of multigroup constants in a 26 group approximation BNAB and the same library with reevaluated data for ^{239}Pu and ^{238}U (BNAB-M) have been used in the calculations. (7 refs.)

75152 Investigation of the influence of some libraries of multigroup constants on the parameters of a standard fast neutron reactor. J.D.Jordanov, N.A.Antonov.

Yad. Energ. (Bulgaria), no.18, p.57-62 (1983). Multigroup diffusion methods are usually used in the neutron physical analysis of fast neutron reactors. An important part in this analysis is the preparation of the effective multigroup cross-sections, characterizing a given reactor environment required for the solution of the multigroup diffusion equation and the solution itself of the diffusion equation in a multigroup approximation. Depending on the library of multigroup constants used, the errors in the determination of the neutron physical parameters of the fast neutron reactors vary. The calculations carried out make possible the evaluation of the influence of the neutron data from the various libraries on the parameters of a simplified model of a fast neutron power reactor. The results of the calculations are presented in tabular form. (9 refs.)

75153 Results of the measurement of the neutron noise in a reactor type WWER-440. II. A.T.Mikulski, G.Alexandrov, D.M.Bobrovski, N.Todorov, T.Zelinski.

Yad. Energ. (Bulgaria), no.18, p.63-9 (1983). For p.t. see Nukleonika vol.25, p.701 (1980). The results of the analysis of the fluctuating component of the signals obtained by neutron detectors, used in measurements of the WWER-440 reactor in the Kozloduj Atomic Power Station, have been presented. Signals from 8 rhodium SPN-detectors and 3 current ionization chambers have been processed. A TPA type computer is used for the calculations. Stochastic characteristics of the signals—correlation functions, spectrum densities, coherent functions, have been obtained. The results are presented in graphic form. Conclusion have been drawn as to the possibilities of using the results obtained for noise diagnostics of the condition of the reactor core. The results are of a preliminary nature. Work is proceeding on the theoretical explanation. (1 ref.)

75154 Approximate noninteractive power regulation of a coupled-core nuclear reactor. M.Tsuiji, Y.Ogawa (Dept. of Nuclear Engng., Faculty of Engng., Hokkaido Univ., Sapporo, Japan).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.3, p.1835-43 (June 1983). The authors describe an application of an approximate decoupling control to the noninteractive power regulation of each core in a coupled-core nuclear reactor model. A method for designing an approximate decoupling controller is presented. The controller consists of an output feedback compensator and a precompensator which is introduced to diagonalize an open-loop frequency response matrix approximately in the frequency range important to reactor dynamics. A 'multipoint diagonalization method' is adopted for the design of the precompensator. This method possesses some superiorities compared with the pseudo-diagonalization method. Digital simulations and graphical studies by the Gershgorin band demonstrate the usefulness of the multipoint diagonalization method as well as the effectiveness of the controller for power regulation. (12 refs.)

75155 Digital computers in CANDU safety systems. I. History and concepts. N.M.Ichiye (AECL, Mississauga, Ontario, Canada).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.3, p.1908-11 (June 1983). Digital computers have been used in CANDU (CANada Deuterium Uranium) reactors for direct digital control as well as control room functions such as alarm annunciation, data logging and the display of operating data on the control panels. However, until recently computers were not used in the special safety systems. The authors examine the increasing role computers are playing in CANDU safety systems, especially the two shutdown systems. The reasons for this strong trend toward increased use of computers are outlined and recent designs are described, with special emphasis on system concepts. (2 refs.)

75156 Digital computers in CANDU safety systems. II. Implementation and experience. R.S.Gilbert (AECL, Mississauga, Ontario, Canada).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.3, p.1912-16 (June 1983). For p.t. see *ibid.*, vol.ns-20, no.3, p.1908-1911 (1983). Microcomputer based systems have recently been applied to CANDU safety systems. The author describes three specific systems, a monitoring system, the programmable digital comparator (PDC) system, and a fully computerized shutdown system prototype. The system configurations, the hardware and the software used to implement these designs are discussed. Each of these systems uses commercial off-the-shelf hardware which has been modified and qualified when necessary to meet specific power plant requirements. (no refs.)

75157 Characteristics of linear induction electromagnetic pump with sodium side bars. T.Gotoh, M.Yamagata, A.Suzuoki (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan), Y.Kazawa. *J. At. Energy Soc. Jpn. (Japan)*, vol.25, no.3, p.196-200 (March 1983). In Japanese.

In order to develop an electromagnetic pump for high temperature use, a sodium side-bar type flat linear induction pump (FLIP) whose nominal operating conditions of flow rate and pump head are $1 \text{ m}^3/\text{min}$ and 226 kPa ($2.3 \text{ kg}/\text{cm}^2$) was fabricated. The performance tests were made in Na over the temperature range of 200–400°C and the following results were obtained. (1) The pump head at zero flow rate is in proportion to the square of the applied voltage and its proportional constant is $4.0 \times 10^{-3} \text{ kPa}/\text{V}^2$. (2) The temperature dependency of the pump head at zero flow rate is $4.7 \times 10^{-4} \text{ }^\circ\text{C}^{-1}$. (3) The overall pressure loss coefficient of this pump is 1.94 being 0.92 for the pump duct and 1.02 for the inlet and outlet reducers of the duct. (6 refs.)

75158 Experimental loop in the Nuclear Training Reactor Budapest. Gy.Csom, E.Kocsis, E.M.Zsolnay, E.J.Szondi, I.Szucs (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.21-9 (1982). The in-pile loop built into the Nuclear Training Reactor of the Technical University Budapest is a common design carried out together with the specialists of the Moscow Energetic Institute. This experimental facility is serving for thermodynamic investigations of irradiated solutions under conditions of 20–300–°C temperature and max. 150 bar pressure. Therefore, the results of such experiments can provide valuable informations on the kinetics and mechanisms of chemical processes occurring in the primary and secondary circuits of WWER-type power reactors. (15 refs.)

75159 Neutron spectrum determination by multiple foil activation method. E.M.Zsolnay, E.J.Szondi (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.31-46 (1982). The main features of the neutron spectrum unfolding code SANDBP are described and some results obtained using this code are presented. The program determines the neutron flux density spectrum from multiple foil activation measurements using an iterative method. Response functions deriving from the unfolded neutron spectrum can also be calculated, furthermore Monte-Carlo error analysis can be performed. The neutron spectrum in the centre of the core of the Budapest University's nuclear reactor was measured and unfolded with the aid of this program. (15 refs.)

75160 Distributed microprocessor-based system for monitoring radiation in nuclear power plants. A.A.Denisov, V.S.Zhernov, I.S.Krashennnikov, V.V.Matveev, N.V.Ryzhov, V.M.Skatkin.

Sov. At. Energy (USA), vol.53, no.3, p.577-86 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.131-8 (Sept. 1982). [received: May 1983] Protection of the environment from anthropogenic actions is becoming a more urgent problem with each passing year. With the rapid growth of nuclear power, one of the complex and specific problems in this area is ecologically safe operation of nuclear electrical power plants, nuclear thermoelectrical power plants, AST, etc. The most important part of the problem is creating measuring and information gathering systems and control systems, which permit monitoring the changes in the environment due to the action of such objects. The authors examine the problems of constructing modern systems for radiation monitoring in nuclear power plants. (6 refs.)

75161 Control of the neutron distribution in a reactor by a liquid absorber. P.T.Potapenko.

Sov. At. Energy (USA), vol.53, no.3, p.601-7 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.147-51 (Sept. 1982). [received: May 1983] The use of a liquid absorber of neutrons for control is one of the trends in the improvement of channel power reactors. Liquid regulation has been applied effectively on the reactors of Canadian nuclear power plants. An extensive program of the application of a liquid absorber on an RBMK has been carried out by Soviet scientists. Liquid regulating units (RU) for the three-dimensional control of the neutron distribution are discussed. (15 refs.)

75162 Technique for preparing microfilters with high specific capacity. G.N.Flerov, E.D.Vorob'ev, V.I.Kuznetsov, V.A.Shegolev, G.N.Akap'ev, P.Yu.Apel', T.I.Mamonova, L.I.Samolova.

Sov. At. Energy (USA), vol.53, no.3, p.652-4 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.181-2 (Sept. 1982). [received: May 1983] As is well known, the rate of flow of a fluid or gas through a filter is inversely proportional to its thickness. The thickness of the usual nuclear microfilter is 10 μm , which does not always ensure high filter capacity, especially with small pore diameter. In order to increase the specific capacity of a filter, even thinner films can be used as the starting material, but it is extremely difficult to work with such filters, since their mechanical strength is inadequate. The authors investigated the possibility of obtaining microfilters with a thin filtering layer by irradiating a polymer film through a mask, consisting of a plate with openings, with accelerated ions with a free path in the bulk of the polymer less than the thickness of the film and with an irradiation dose that ensures complete subsequent etching of regions that are not protected by the mask to a depth equal to the path length of the ions. (4 refs.)

75163 Theoretische Beschreibung des Reaktorrauschens in einem stark gekoppelten reaktorphysikalisch-thermohydraulischen System (Theoretical determination of the reactor noise in a strongly coupled reactor kinetic-thermohydraulic system). L.Mesko, T.Katona.

Report KFKI-1983-36, Hungarian Acad. Sci., Budapest (1983), 20 pp. In German.

The coupled neutron-kinetic-thermohydraulic noise phenomena in a core of a PWR has been investigated. The theoretical model derived from the Markovian description of the multi-variable system enables the authors to calculate the auto- and cross power spectral densities and compare them with and without subcooled boiling. (8 refs.)

75164 Simulation of overcooling transients with the Modular Modeling System (MMS). P.K.Jain (Systems Control Inc., Palo Alto, CA, USA), S.Oh, S.M.Divakaruni.

Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.4/01-16 vol.1

The Modular Modeling System (MMS) code developed by the Electric Power Research Institute (EPRI) is an economical, dynamical simulation code for rapid and accurate analysis of operational transients and accidents in the PWRs. The key feature of the code is the user convenience in model adaptation to analyze series of transients for a given plant. Extended plant transients can be analyzed with sufficient accuracy and in faster-than real-time with proper choice of modules from the MMS library. However, when accuracy is not of primary concern and the modeling objective is to perform trend or scoping analyses, MMS offers simple modules that can be integrated into the plant model merely by replacing a few key modules. (5 refs.)

75165 Once through steam generator model. R.P.Broadwater, N.G.Demas (Tennessee Technol. Univ., Cookeville, TN USA).

Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.11/01-25 vol.1

Overfill transients can lead to rapid overcooling of the primary system in nuclear power plants. Such overcooling may result in excessive thermal stress of primary loop components, and is currently of considerable interest. This paper addresses modeling and simulation of a once through steam generator for overfill transients. In a computer simulation of this event, the simulation algorithm must switch from the normal operating mode for the steam generator to the overfill mode, and then be capable of switching back from the overfill mode to the normal mode. In transitioning between two different physical conditions in a simulation, major effects to avoid are jumps in state variables at the point of switching and oscillating back and forth across the switch boundary. The normal operating mode, the overfill mode, and the

switching between the modes are considered in this paper. The computer code used in the simulation is discussed and listed, and a brief description of the numerical techniques utilized is given. (3 refs.)

75166 Modeling and estimation applied to an AGR once-through boiler. C.Tye, W.J.Hill (Simon Engng. Lab., Univ. of Manchester, Manchester, England).

Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.13/01-19 vol.1

Nonlinear and linearised models of an AGR once-through serpentine boiler have been developed and used in studying the performance of a simple sub-optimal state estimation filter incorporating a nonlinear internal model. Uncertainties (biases) in the boiler inputs cause errors in the filter estimates, and these errors can be reduced somewhat by using a parallel bias estimation filter. The results obtained so far indicate that the state variables and outputs for the superheated steam region can be estimated with reasonable accuracy, but the estimates for the subcooled water and two phase regions can be poor if the biases are large. (14 refs.)

75167 Dynamic computer simulation of the Fort St. Vrain steam turbines. J.C.Conklin (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.15/01-15

A computer simulation is described for the dynamic response of the Fort St. Vrain nuclear reactor regenerative intermediate- and low-pressure steam turbines. The fundamental computer modeling assumptions for the turbines and feedwater heaters are developed. A turbine heat balance specifying steam and feedwater conditions at a given generator load and the volumes of the feedwater heaters are all that are necessary as descriptive input parameters. Actual plant data for a generator load reduction from 100 to 50% power (which occurred as part of a plant transient on November 9, 1981) are compared with computer-generated predictions, with reasonably good agreement. 75168 Leakage detection by diagnostic analysis of oscillation. P.Siklosy (VEIKI, Budapest, Hungary).

Energ. & Atomtech. (Hungary), vol.36, no.1, p.38-48 (Jan. 1983). In Hungarian.

The safe operation of nuclear power plants is based on controlling the stress cracking that precedes equipment failures in the primary circuit. Instrumental control of various effects caused by liquids flowing through ruptures is of great importance. Leakage detection based on noise analysis may be applied also. Interpretation, explanation and evaluation of measurement signals are, however, complex and preliminary experiments are necessary in which commissioning measurements play an important role. The question of special detectors and signal resolution are stressed. Trace transport, noise and ban filtering give rise to special problems. (13 refs.)

75169 Four-inch pipe whip test under BWR LOCA conditions: effect of overhang length. R.Kurihara, S.Ueda, T.Isozaki, N.Miyazaki, R.Kato (Japan Atomic Energy Res. Inst., Tokyo, Japan), K.Saito, S.Miyazono.

J. At. Energy Soc. Jpn. (Japan), vol.25, no.3, p.207-16 (March 1983). In Japanese.
Pipe whip tests or jet discharge tests have been performed at the Japan Atomic Energy Research Institute, which simulate the instantaneous guillotine break of primary coolant piping in nuclear power plants. The authors describe the results of the 4-inch pipe whip tests (RUN 5407, 5501, 5504, 5603), under the BWR LOCA conditions, which were performed from 1979 to 1981. The test pressure was 6.8 MPa and test temperature 285°C. In these tests, clearance was kept constant at the value of 100 mm and overhang lengths were 250, 400, 550 and 1000 mm, respectively. The main purpose of these tests is to investigate the effect of overhang length on pipe whip behavior. From the tests results, the pipe movement is effectively limited by the restraints if the overhang length is 250 mm or 400 mm. The deformation of

the test pipe and restraints becomes large with increasing overhang length. It is clarified that the test pipe collapses at the setting point of the restraints with the overhang length more than 900 mm. (11 refs.)

75170 Experimental verification of steam into sodium leak detection methods at the Czechoslovak modular steam generator 30 MW working at BOR 60. O.Matal, I.Sobotka, I.Banovets, M.Konarik, F.Varvarovski, K.Kafka, V.Makh, V.I.Kondrat'ev, V.V.Cernobrovkin, V.V.Golusko, V.S.Sroelov, Yu.V.Privalov, E.Pridehl, H.Mauersberger, K.I.Frohlich.

Jad. Energ. (Czechoslovakia), vol.29, no.5, p.183-9 (May 1983). In Russian.

Briefly describes leak detection methods checked-up by steam into sodium artificial leaks at the Czechoslovak modular steam generator 30 MW at the experimental power plant BOR 60. Further, chosen results of processed measurements, performed during operational verification of these methods are given and discussed, and attention is paid to some significant signal characteristics of sensors registering steam generator leakages. (23 refs.)

75171 Simulation of recovery from a steam generator tube leak transient. P.W.Wyatt (Westinghouse Electric Corp., Pittsburgh, PA, USA).

Proceedings of the Fifth Power Plant Dynamics, Control and Testing Symposium, Knoxville, TN, USA, 21-23 March 1983 (Knoxville, TN, USA: Univ. Knoxville 1983), p.3/01-9 vol.1

The importance attached to nuclear safety analysis has led to the development of many large, sophisticated thermal-hydraulics codes. These codes, however, are in general not suitable for use with the small computers used in reactor simulator application. They cannot operate in real time on such machines. But the need to respond to increasing demands for simulation fidelity and the upgrading of the simulator from a training device to an engineering tool necessitate a new approach to simulator modeling. The modeling is now required to increase in sophistication such that two-phase flow, reverse flow, stratification, condensation, evaporation, and natural circulation are described by incorporating a small thermal-hydraulics code in the simulator. Various analytical techniques are used to run in real time with a minimum of nodes. Such a drift-flux model of the reactor coolant system, steam generators and steam header, plus associated auxiliary systems, is described, and examples of typical training exercises are given. 28.52 FUSION REACTORS

(for confinement, see 52.55)

- 75172 High power pulsed lasers. J.F.Holzrichter, D.Eimerl, E.V.George, J.B.Trenholme, W.W.Simmons, J.T.Hunt (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *J. Fusion Energy (USA)*, vol.2, no.1, p.5-45 (Feb. 1982). [received: June 1983]
- Pulsed high power lasers can deliver sufficient energy on inertial fusion time scales (0.1-10 ns) to heat and compress DT fuel to fusion reaction conditions. Several laser systems have been examined for application to the fusion problem. Examples are Nd:glass, CO₂, KrF, and I₂. A great deal of developmental effort has been applied to the Nd:glass laser and the CO₂ gas laser systems. These systems now deliver $>10^4$ J and $>20 \times 10^{12}$ W to inertial fusion targets. The Nova Nd:glass laser is being constructed to provide >200 kJ and $>200 \times 10^{12}$ W of 1 μ m radiation for fusion experimentation in the mid-1980s. For inertial fusion target gain, >100 times the laser input, it is expected that the laser must deliver $\sim 3-5$ MJ of energy on the 10-20 ns time scale. The authors review the developments in laser technology and outline approaches to construction of a 3-5 MJ driver. (83 refs.)
- 75173 Requirements for D-D tandem mirror reactors. F.Kantrowitz, R.W.Conn (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA). *J. Fusion Energy (USA)*, vol.2, no.1, p.59-70 (Feb. 1982). [received: June 1983]
- Requirements for D-D barrier tandem mirror reactors are calculated from an equilibrium power balance model. To obtain adequate plasma Q and reasonable power density, axisymmetric configurations are required to decrease barrier length and radial transport and to increase central cell beta. The authors find that for a reactor producing 900 MW net electric power from a $Q=6.5$ plasma, a central cell length of 225 m, maximum B of 15 T, and neutral beam injection energy of 700 keV are necessary. In addition to high central cell beta ($\sim 70\%$), high barrier beta ($\sim 40\%$) is needed to allow the ECRH power required to reduce the barrier potential. Using too much barrier ECRH power results in a decrease in Q . Nuclear elastic scattering of fusion products plays an important role in the overall plasma power balance. When nuclear scattering and coulomb scattering are included, the plasma Q value is increased by more than 40% compared to the case when coulomb scattering alone is considered. (29 refs.)
- 75174 Normal conducting steady-state toroidal magnet systems for ignited Tokamaks. K.Borrass, M.Soll (Max-Planck-Inst. für Plasmaphys., Garching, Germany). *J. Fusion Energy (USA)*, vol.2, no.1, p.71-82 (Feb. 1982). [received: June 1983]
- Normal conducting steady-state toroidal magnet systems are investigated, emphasis being placed on applications to large ignited next generation Tokamaks. The study is based on water-cooled tape wound D coils. The data for the TF magnet systems are calculated in a consistent manner with a computer program including the plasma, shield, ohmic heating coil system, and geometric requirements for blanket modules, beam ducts, etc. An opti-

mization procedure is used to find those TF coil systems which minimize cost-relevant quantities. The main results are that normal conducting TF coil systems of ignited next-generation Tokamaks (following JET, TFTR, etc.) can be operated in a stationary mode and fed from the grid. Cost for electricity is a relatively small portion of the investment cost even in the case of long integral burn times ($>10^7$ s). (12 refs.)

- 75175 Lower hybrid heating and current drive system for a Tokamak reactor. D.A.Ehst, C.D.Boley, K.Evans, Jr., Jungchung Jung, C.A.Trachsel, T.Hino (Fusion Power Program, Argonne Nat. Lab., Argonne, IL, USA). *J. Fusion Energy (USA)*, vol.2, no.1, p.83-109 (Feb. 1982). [received: June 1983]

A lower hybrid heating system has been designed for heating a Tokamak reactor to ignition and for sustaining steady-state operation by driving the toroidal plasma current. The power spectrum from an active/passive waveguide grill is computed, and the resulting equilibrium current density profile is computed from a full electromagnetic WKB analysis of wave propagation in a cylinder. The corresponding toroidal current profile is a low-current equilibrium which is stable to various ideal modes at an economically acceptable beta. The electronic circuitry is designed to minimize the electric power required for current drive, and the resulting design appears to provide reliable operation in a reactor environment. The same system can drive current during reactor startup if some of the waveguides are modified slightly. A typical sequence of startup equilibria is calculated. (51 refs.)

- 75176 Simulating field-reversed magnetic-mirror fusion devices. T.A.Brenge, B.I.Cohen, M.E.Stewart (Lawrence Livermore Nat. Lab., Livermore, CA, USA).

Computer (USA), vol.16, no.6, p.44-9 (June 1983).

Array processing techniques are allowing physicists to program in FORTRAN and generate fast machine code. The simulations show close agreement with theoretically predicted results. Nuclear energy research at Lawrence Livermore National Laboratory indicates that field-reversed magnetic mirror machines may offer greater efficiency and higher electrical yields than current reactor designs. Since theoretical analysis of the FRM is difficult, they are modelling the ion kinetics and electron physics of a fusion plasma to analyze the buildup and decay processes that might be characteristic of an actual machine. They have developed a simulation that accurately models the developing current distribution and use an array processor to obtain faster run times. (13 refs.)

- 75177 Lithium doping of candidate fusion reactor alloys to simulate simultaneous helium and damage production. J.Megusar, O.K.Harling, N.J.Grant (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.192-6 (April 1983).

Lithium and boron doping techniques are possibilities for simulating simultaneous helium production and displacement damage in bulk specimens of non-nickel bearing materials in fast fission reactors. Rapid solidification processing and powder metallurgy salt decomposition were investigated for the preparation of lithium doped alloys. For convenience, austenitic stainless steel was doped rather than non-nickel bearing alloys for which this technique is ultimately designed. Neutron autoradiography verified a uniform distribution of lithium in the alloy. Although the same approach can be used to dope alloys uniformly with a stable boron compound, thus reducing the problem of grain boundary segregation and coarsening, the use of lithium doping should be an advantage because this dopant produces only helium and hydrogen when irradiated in a fast fission reactor. These elements are also produced in materials in the CTR environment. (15 refs.)

- 75178 Use of mercury to regenerate liquid-alloy tritium getters. D.H.W.Carstens, W.R.David (Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.203-5 (April 1983).

La₂Ni is investigated as a prototype alloy for the gettering of tritium in a fusion reactor. It is shown that it is possible to quantitatively regenerate the getter by first forming an intermediate mercury amalgam at relatively low temperatures. The gas-free amalgam is then thermally decomposed to obtain the original getter alloy. (6 refs.)

- 75179 Electron beam fusion, energy compression, and the absolute instability. R.Jones (Phys. Dept., Nat. Univ. of Singapore, Kent Ridge, Singapore). *Pramana (India)*, vol.20, no.1, p.47-54 (Jan. 1983). [received: May 1983]
- Absolute electron beam-plasma instability is suggested as a means of energy compression for pellet and linear inertial confinement fusion systems. (17 refs.)

- 75180 Fusion: towards reality [Tokamak experiment]. M.Abbott.

Pract. Electron. (GB), vol.19, no.6, p.30-4 (June 1983).

Discusses the project, based at Culham in Oxfordshire, known as the Joint European Torus (JET). The complex houses the most ambitious fusion venture of the European Atomic Energy Community (Eurotom). As far as the fusion alternative is concerned, only one mechanism has the potential to produce enough heat to generate commercially viable electric power. This toroidal machine is called a Tokamak. The objective of the JET project is to create a plasma with a size, density and temperature comparable to that required by a power producing reactor. This plasma will need to reach a temperature of 100 million degrees centigrade. The plasma column will be about two metres in diameter, and have a density 100 million million atoms per cubic centimetre. Although many other difficulties lie in the path towards an economic fusion power station, achieving these parameters on the JET is a quantum leap forward. (no refs.)

- 75181 Inertial confinement fusion. D.Keefe (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

In book: *Annual review of nuclear and particle science. Vol.32*, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.391-441. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

In future years inertial confinement fusion can offer an inviting alternative to magnetic confinement fusion for electricity generation. In particular, a much wider variety of choice in the design of the reaction containment vessel is allowed since this method of confinement does not require the vessel to be cocooned within intricate field windings. Furthermore, the overlap between reactor design and driver design is minimal. (48 refs.)

- 75182 Benchmark experiment on D-T neutrons and secondary gamma rays streaming through a concrete bent duct. S.Tanaka, Y.Oyama, N.Sasamoto, T.Nakamura.

Report JAERI-M-82-130, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Sept. 1982), 45 pp.

A streaming experiment was carried out to examine the behavior of D-T neutrons and secondary gamma rays in a concrete bent duct constructed as a personal access way in the Fusion Neutronics Source Facility (FNS). The distributions in the duct were measured for neutron and gamma-ray dose equivalents, fast neutron dose, and thermal neutron flux. The energy spectra of fast neutrons and gamma rays were also measured at four positions in the duct. This report describes in detail the experimental technique, the measured

data as well as the experimental conditions such as the configuration and the composition of the structural materials and the source conditions which are essential for the analysis of the measurements. (9 refs.)

75183 Japanese contributions to IAEA INTOR Workshop, Phase IIA. Chapters I, II, III: Summary and INTOR concept.

Report JAERI-M-82-170, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 102 pp.

Japanese contributions at INTOR Phase 2A are summarized. This report contains Introduction, Summary of the total report and INTOR Concepts.

75184 Japanese contributions to IAEA INTOR Workshop, Phase IIA. Chapter IV: Plasma confinement and control. K.Miyamoto, M.Sugihara, K.Ueda, S.Yamamoto, M.Maeno, S.Sengoku, N.Suzuki, S.Kasai, M.Nagami, T.Toda, K.Tani, M.Okamoto, N.Fujisawa.

Report JAERI-M-82-171, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 49 pp.

This report corresponds to Chapter IV of Japanese contribution report to IAEA INTOR workshop, Phase IIA. Studies are centered on confinement performance of INTOR core plasmas, losses induced by toroidal field ripples and discharge controls indispensable to long burn.

75185 Japanese contributions to IAEA INTOR Workshop, Phase IIA. Chapter V: RF heating and current drive. K.Miyamoto, M.Sugihara, H.Kimura, H.Matsumoto, K.Oadajima, T.Imai, A.Fukuyama, M.Okamoto, T.Nagashima, T.Yamamoto, T.Ohno, N.Kobayashi, T.Uchida, J.Ohmore, Y.Sawada, K.Ebisawa, K.Uchida, M.Yamauchi, N.Fujisawa.

Report JAERI-M-82-172, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 101 pp.

This report corresponds to Chapter V of Japanese contribution report to IAEA INTOR workshop, Phase IIA. Physics studies for radio frequency heating are concentrated on heating to ignition by means of ion cyclotron and lower hybrid ranges of frequencies, and discharge start-up assist and current drive by lower hybrid range. Their system design studies are also performed.

75186 Annual report of the Fusion Research and Development Center for the period of April 1, 1981 to March 31, 1982.

Report JAERI-M-82-154, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Nov. 1982), 211 pp.

Research and development activities of the Fusion Research and Development Centre (Division of Thermonuclear Fusion Research and Division of Large Tokamak Development) from April 1981 to March 1982 are described. Emphasis in the JFT-2 and Doublet III Tokamak programs was placed on high-power heating experiments. JFT-2M, which is to replace JFT-2, is in fabrication and will be operational in early 1983. Construction of JT-60 progressed as planned with its completion targeted in March 1985.

75187 Neutron sensitivity of SSNTD. L.Medveczky (Inst. of Nuclear Res. of the Hungarian Acad. of Sci., Debrecen, Hungary).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.357-62 (1982). [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

Various types of solid state nuclear track detectors (SSNTDs) with and without converter radiators were irradiated with neutrons of different energy spectra in order to obtain information on their neutron sensitivity in beam dosimetry. Track revealing was performed by chemical etching. A manual track counting technique was chosen except for the case of thin plastic foils, where also automatic spark counting was used. (13 refs.)

75188 Environmental monitoring system at the Paks Nuclear Power Station. I.Feher, S.Deme, A.Andrasi (Health Phys. Dept., Central Res. Inst. for Phys., Budapest, Hungary).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.373-9 (1982). [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

The environmental monitoring system of the Paks Nuclear Power Station (Hungary) has been designed with a dual aim: in normal operation: to check that the population's burden does not exceed the prescribed dose limit; under accidental conditions: to provide rapid information on the expected radiation burden of the population so that necessary steps can be taken. For assessing environmental doses the following parts of the monitoring system are used: telemetric stations to determine the time integral of ^{131}I concentration in air and the gamma dose rate; sampling stations and devices for sample measurement; mobile laboratories; a meteorological tower. The main principles and structure of the environmental monitoring system are discussed. (7 refs.)

75189 Telemetric and data acquisition system for environmental monitoring at the Paks Nuclear Power Station. S.Deme, I.Feher, M.Rovid (Health Phys. Dept., Central Res. Inst. for Phys., Budapest, Hungary).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.381-7 (1982). [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

The telemetric and data acquisition system is an inherent part of the total environmental monitoring system of the Paks Nuclear Power Station (Hungary). The detectors of the telemetric system measure the following parameters: the gamma dose rates, the time integral of the ^{131}I activity concentration,

the water temperature, and the meteorological data needed for dispersion calculations. In the 48 channels of the central acquisition system the data mentioned above are stored in the form of pulses, with the exception of the wind direction, which is characterized by the most frequent direction during the measuring period (one hour or 6 minutes). The results are printed on a telex writer and punched on tape for further computer analysis. The characteristic features of the system and the possible uses of the data obtained, both for normal operation and emergency cases are discussed. (3 refs.)

75190 Gamma spectrometric measuring system for environmental sample analysis. A.Andrasi, P.Zombori (Health Phys. Dept., Central Res. Inst. for Phys., Budapest, Hungary).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.389-95 (1982). [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

A desk calculator controlled gamma spectrometer was installed and calibrated for routine sample analysis in the environment of the first Hungarian nuclear power plant. A combined application of high efficiency NaI(Tl) and high resolution Ge(Li) spectrometry was elaborated to process the great number of measurements. Measurement is controlled and spectrum evaluation is performed by an on-line program (MEASSYSI) developed for the EMG-71666 desk calculator. The multi-step testing procedure proved the applicability and reliability of the system. (1 ref.)

75191 Comparison of field dose rate measurements and Monte Carlo calculations. L.Koblinger, I.Nemeth, P.Zombori, A.Andrasi (Health Phys. Dept., Central Res. Inst. for Phys., Budapest, Hungary).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.397-404 (1982). [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

Dose rates from natural terrestrial gamma sources calculated by a Monte Carlo program and derived from NaI(Tl) scintillation measurements as well as calculated and measured count rates of G-M detectors are compared and show satisfactory agreement. (6 refs.)

75192 Dose measurements in the teaching reactor of Budapest Technical University after the reconstruction. E.Viragh (Tech. Univ., Budapest, Hungary).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.347-52 (1982). In German. [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

Explains that the teaching reactor of Budapest Technical University has now been rebuilt to generate 100 kW. The fuel is enriched with 10% ^{235}U and the moderator is graphite+water. The measuring equipment comprises gamma dosimeters, neutron dosimeters and LiF and CaF_2 thermoluminescent detectors. Data of the reactor and some typical measurements are tabulated. (1 ref.) J.S.

75193 Monitoring external radiation in the environment: instruments and results of measurements. E.Tschirf, N.Vana (Univ. Wien, Wien, Austria).

Acta Phys. Acad. Sci. Hung. (Hungary), vol.52, no.3-4, p.363-72 (1982). In German. [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

Describes methods used for measuring radiation fields near the TRIGA reactor (Atomic Institute of Austrian Universities). Dose measurements are carried out with GM counter tubes and TL detectors (CaF_2/Dy and LiF/Mg, Ti). Results for 1979-81 are presented (graphs and tables). Results of counter tube measurements agreed with those of TL detectors. (3 refs.)

75194 Comparison between two thermoluminescence dosimeter materials. S.Babbout, C.Furetta (I Cattedra di Fisica Medica, Univ. degli Studi di Roma, Roma, Italy).

Radiat. Prot. Dosim. (GB), vol.4, no.1, p.37-42 (1983).

Comparison is made between the properties of two TL dosimetric materials, LiF and $\text{MgB}_2\text{O}_7\cdot\text{Dy}$. The results show that $\text{MgB}_2\text{O}_7\cdot\text{Dy}$ has promising properties for use as a personal dosimeter having better sensitivity and a lower dose threshold but providing less dosimetric information. (6 refs.)

75195 Large volume electret dosimeter for measurement of low level radiation. P.C.Gupta, P.Kotrappa, S.K.Dua (Health Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).

Radiat. Prot. Dosim. (GB), vol.4, no.1, p.47-9 (1983).

An electret is a piece of dielectric carrying quasi-permanent electrostatic charge. A negatively charged electret loaded at the top centre of a 4.8 litre plastic chamber was observed to discharge exponentially with the cumulative dose. However, the dose required to bring the charge to half of its initial value $D_{1/2}$ depended on the dose rate (D). There was a systematic power function relationship between D and $D_{1/2}$ over certain ranges of electret charge. Such a relationship was used to calculate the unknown dose rate by knowing the ratio of initial to final charge and the time of exposure. There was a good agreement between the dose rates estimated to the dose rates expected from a standard radium source. The method was found to be sensitive enough to measure dose rates at environmental level ($10 \mu\text{R h}^{-1}$) within a period of 10 to 20 hrs. The method also provided an energy independent and time averaged dose rate measurement, an important factor in some cases. (4 refs.)

75196 Calculation of the activation energies for single TLD-900 glow-curve components. C.Bacci, R.Bernabei, S.d'Angelo (Inst. di Fisica 'G. Marconi', Univ. di Roma, Rome, Italy), C.Furetta.

Radiat. Eff. Lett. Sect. (GB), vol.76, no.3, p.55-9 (1983).

Presents the activation energies for $\text{CaSO}_4\cdot\text{Dy}$ (TLD-900) material as evaluated by a decomposition of the experimental glow-curve into single components. (9 refs.)

75197 SPICER: a sensitive radiation survey instrument. N.Latner, K.Miller, S.Watnick, R.T.Graveson (Environmental Measurements Lab., US Dept. of Energy, New York, NY, USA).

Health Phys. (GB), vol.44, no.4, p.379-86 (April 1983).

A compact, portable field instrument for measuring environmental γ -ray exposure rates has been developed. Based on an 18 cm diameter pressurized ionization chamber, a temperature compensated MOSFET electrometer and a digital readout with selectable integration times, it is a considerable improvement over previously used larger and bulkier instruments of this type. (6 refs.)

75198 A new phosphor $\text{Li}_2\text{B}_4\text{O}_7\cdot\text{Cu}$ for TLD. M.Takenaga, O.Yamamoto, T.Yamashita (Matsushita Electric Industrial Co. Ltd., Materials Res. Lab., Osaka, Japan).

Health Phys. (GB), vol.44, no.4, p.387-93 (April 1983).

The phosphor $\text{Li}_2\text{B}_4\text{O}_7\cdot\text{Cu}$ (0.03% by weight) has an effective atomic number of 7.3, which is very similar to that of tissue (7.4). This suggests that the phosphor should have excellent properties for thermoluminescent dosimetry. The phosphor prepared by a sintering method shows two glow peaks composed of a dosimetric peak at 205°C and a shoulder at 120°C , and a broad emission band peaking at 368 nm. The material based on the stoichiometric compound of $\text{Li}_2\text{O}\cdot 2\text{B}_2\text{O}_3$ has a good moisture resistant property. The dosime-

tric characteristics are as follows: (1) The sensitivity of γ rays is about 20 times higher than that of $\text{Li}_2\text{B}_4\text{O}_7\text{:Mn}$ prepared by the conventional melting method. (2) The dosimetry peak of 205°C fades less than 9% in intensity at 25°C after 60 days in dark. (3) The TL output is linear with exposure to about 10^4R , becoming sublinear above it. (4) The sensitivity loss caused by humidity is about 10-25% after 2-6 months of storage in air of 90% relative humidity at 25°C . (5) The energy dependence of TL output for photons is flat within the limit of 10% from 40 keV to 7 MeV. (6) The light induced fading is 10% after 3 h room lighting at 100 lux. (6 refs.)

75199 Multi-element dosimeters for radiation protection measurements. H.H.Rossi (Dept. of Radiology, Columbia Univ. Coll. of Physicians & Surgeons, New York, NY, USA).

Health Phys. (GB), vol.44, no.4, p.403-5 (April 1983).

A design for a multi-element tissue-equivalent proportional counter is presented, which should result in an instrument that is in several aspects superior to the single tissue equivalent proportional counters that have been applied for the determination of the dose equivalent, H. (8 refs.)

75200 New health physics perspectives affecting instrumentation technology. E.J.Vallario (Office of Nuclear Safety, US DOE, Washington, DC, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.3, p.1905-7 (June 1983).

Measurements obtained from health physics instrumentation are basic to the radiation control process and are used by management to assure that radiation exposures are kept within limits specified by national-international authorities. Because of this inseparable relationship, health physics instrumentation must be keyed on a continuing basis to changes in radiation exposure standards. (11 refs.)

75201 Activation and decay characteristics of radiation shielding heavy concretes. E.M.Zsolnai, Gy.Csom, E.J.Szondi (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.47-75 (1982).

Activation and decay characteristics of 4 different kinds of heavy concretes were studied. First the elementary composition of the concretes was determined, afterwards calculations were performed by the computer code CAP to determine the desired parameters. The results obtained for the different concretes were analysed and requirements of producing radiation shielding concretes with optimal activation characteristics were summarized. (26 refs.)

75202 Temperature fields and thermal stress fields in radiation shieldings. E.J.Szondi (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.77-91 (1982).

The heat sources developing in the shieldings of radiation sources are presented. Approaching their locus dependence by a polynomial or by an exponential series, a differential equation for thermal conductivity will be obtained which can be solved analytically. In the knowledge of the temperature field the thermal stress field can be calculated. A computer program termed TESTRE ('thermal stress') was developed which provides a satisfactory approach of the thermal stress field. (15 refs.)

75203 Straight tube nests in concrete walls for radiation shielding. E.J.Szondi (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.93-103 (1982).

Measuring cables, sampling pipelines etc. starting from the rooms of the primary circuit of the Paks Nuclear Power Plant are passed through concrete shielding walls in protective armatures made of straight tube nests. The confined area between the tubes affects the homogeneity of the concrete unfavourably. Because of the intricate geometry, the actual conditions can be followed only experimentally. In these experiments, the gamma-radiation field behind the protective armature has been investigated using both extended and point sources. The attenuating effect of wall armature specimen prepared under service conditions is inferior as compared with the specimen considered ideal, prepared in the laboratory. Local defects resulting from inhomogeneities in the concrete can be sufficiently detected. (8 refs.)

75204 Testing of radiation shielding concrete walls with portable betatrons. D.Bodizs (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.105-12 (1982).

With high-intensity radiation sources, when the walls serving for radiation shielding simultaneously perform the function of structural elements of the building housing the source, the thickness of the walls is defined primarily by the required radiation shielding and not by statistical aspects, since from the construction view thinner walls would usually do as well. It is preferable to test the serviceability of such walls with respect to radiation shielding before the installation of the source, since the reinforcement of shielding, if found necessary after the installation of the accelerator or nuclear reactor, will be inconvenient and costly. On the other hand, in thick (60 to 120 cm) concrete walls the probability of the formation of cavities and of non-uniform density distribution will be higher, and these factors largely impair the radiation-shielding characteristics of the wall. For such tests, inspection with gamma rays is in general use. However, with increasing wall thicknesses, higher energies and intensities of the radiation will be required. The author therefore studied the serviceability of a transportable betatron providing 6 MeV X-ray radiation for testing the gamma ray attenuation power of concrete walls with thicknesses exceeding 60 cm. In the experiments discussed the author studied the detectability of defects (cavities) in concrete for various wall thicknesses and for the case of the cavities being located at various depths within the wall. (10 refs.)

75205 Measuring apparatus for monitoring radioactive noble gas discharge in nuclear power plants. S.Desi (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.139-44 (1982).

An apparatus for measuring radioactive noble gases emitted through the ventilation stacks of nuclear power plants is described. The apparatus uses a semiconductor detector accommodated in a low-background measuring chamber. The data measured are processed with a CAMAC type multichannel analyzer and a microprocessor. Both sampling and measuring are fully automated. The results are shown on a colour display and recorded on punched tape. (no refs.)

75206 Role of sensitivity analysis in determining reactor quantities. K.Mihaly (Nuclear Training Reactor, Tech. Univ. Budapest, Budapest, Hungary).

Period. Polytech. Electr. Eng. (Hungary), vol.26, no.1-2, p.193-213 (1982).

The approach of the sensitivity analysis problem described here is shown to be an effective method for biological shield calculation to determine reactor quantities obtained from integral experiments. However, it must be borne in mind that in this case the integral experiments that can be carried out are more limited than in the case of core measurements. It is obviously somewhat risky to extrapolate the obtained results for all shield-designing requirements,

based on the sensitivity analysis of a particular data set, since sensitivities are extremely problem-dependent in shield calculations. This notwithstanding, the results presented here prove that at a certain stage of shield design, reliable and relatively rapid information can be obtained on the accuracy of a reactor quantity measured in a relatively undemanding integral experiment and calculated by a well-tested code, based on a semi-empirical calculation procedure using the method of cross section sensitivity analysis proposed here. (26 refs.)

75207 Monitoring the distribution of radionuclides throughout the technological circuits of a nuclear power station. V.L.Antonov, A.A.Gruzdeva, V.S.Zhernov, S.K.Kozlov, O.B.Lapshchev, V.V.Matveev, V.V.Pushkin, M.K.Romanichev, A.E.Shermakov, E.P.Vargin, L.P.Drozdoza.

Sov. At. Energy (USA), vol.53, no.3, p.587-95 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.138-43 (Sept. 1982). [received: May 1983]

In recent years, the demands on the operating safety of nuclear power stations and the protection of the environment have been increased. Because of this, in modern radiation safety monitoring systems an important role is being assigned to the prediction of a possible deterioration of the radiation environment. For nuclear power stations with water-cooled-water-modulated power reactors (VVER), the most probable entry of radioactive substances into the outside medium is a result of breakdown of the turbogenerator hermetic sealing. The authors discuss the monitoring of radionuclides in the primary circuits. (4 refs.)

75208 A LiF es a CaSO_4 termolumineszcens detektorok neutronerzékenysége vizsgálatára (Thermal neutron sensitivity of LiF and CaSO_4 thermoluminescent detectors). P.P.Szabo, J.Palfalvi.

Report KFKI-1983-45, Hungarian Acad. Sci., Budapest (1983), 22 pp. In Hungarian.

The neutron sensitivity of LiF discs, ^7LiF , $\text{CaSO}_4\text{:Dy}$ and $\text{CaSO}_4\text{:Tm}$ powder was investigated at the neutron energies of 2 keV, 24 keV and 144 keV and with thermal neutrons. The neutron irradiations were carried out at the NBS reactor, Washington, DC, USA. (8 refs.)

75209 Application of optical fiber waveguides in radiation dosimetry. W.Gaebler, D.Braunig (Hahn-Meitner-Inst. für Kernforschung Berlin GmbH, Berlin, Germany).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.185-9

It is shown that currently available optical fibers used for optical communication purposes exhibit properties, which are well suited for their application as radiation detectors. The sensitivity is adequate and the potential of a reset operation is presented. The annealing behavior has to be investigated by further research work. (14 refs.)

28.90 OTHER TOPICS IN NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

75210 The nuclear export policy of the Reagan administration. J.F.Pilat, W.H.Donnelly, A.Verbruggen.

Energy Policy (GB), vol.11, no.2, p.168-76 (June 1983).

The Reagan Administration maintains the Carter Administration's objective of non-proliferation of nuclear weapons as being fundamental to US nuclear export policy. However, it sees the USA as having another important role to play in influencing the use of nuclear power and the trading of related goods

and technologies in other countries. While the Administration believes its policies will prove beneficial to the USA, there is concern that trade considerations are being given priority over preventing the proliferation of nuclear weapons. (37 refs.)

75211 Annual report of the division of high temperature engineering (April 1, 1981-March 31, 1982). Report JAERI-M-82-133, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Oct. 1982), 131 pp.
Research activities conducted in the Division of High Temperature Engineering during fiscal 1981 are described. R&D works of this division are mainly related to a multi-purpose very high-temperature gas-cooled reactor (VHTR) and a fusion reactor. This report deals with the main results obtained on material tests, development of computer codes, heat transfer, fluid-dynamics, structural mechanics and the construction of an M+A (Mother and Adapter) section of a HENDEL (Helium Engineering Demonstration Loop) as well.

(for plasma accelerators, see 52.75)

75212 Accelerators—limitations of technology. A summary of the Snow-mass accelerator working group reports. M.Tigner (Cornell Univ., Ithaca, NY, USA). *AIP Conf. Proc. (USA)*, no.98, p.80-8 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).
Hadron colliders and accelerators in the 20 TeV energy range turned out to be the majority interest among active members of the Accelerator Row Group. While other types of accelerator and other energy ranges were discussed, largely on the basis of work done elsewhere, the primary creative activities at this summer study focused on the hadron facility. Examining both the economic and accelerator physics dimensions of such a facility, some hope was given to the idea that a well designed and concentrated R/D program, elaborating much further on technologies, might bring a 20 TeV facility within the national reach. The central challenges for this R/D program appear to be (1) Achievement of virtual automation of superconducting magnet, accelerator housing and other accelerator component manufacture and installation. (2) Achievement of a thorough understanding in the field vs. cost relation for superconducting magnets. (3) Achievement of a thorough understanding of the luminosity-aperture-energy relation. (8 refs.)

75213 Detectors and luminosity for hadron colliders. R.Diebold (Argonne Nat. Lab., Argonne, IL, USA). *AIP Conf. Proc. (USA)*, no.98, p.89-102 (1982). [received: May 1983] (Conference on Particles and Fields - 1982, College Park, MD, USA, 28-30 Oct. 1982).
Three types of very high energy hadron-hadron colliders are discussed in terms of the trade-off between energy and luminosity. The usable luminosity depends both on the physics under study and the rate capabilities of the detector. (9 refs.)

75214 Charge oscillations in orbitrons. M.Porto Pato (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil), L.C.Gomes. *Rev. Bras. Fis. (Brazil)*, vol.12, p.93-113 (March 1982). In Portuguese. [received: April 1983]
A statistical model for the electron distribution in orbitrons is constructed where the effect of the end plates is considered. A comparison is made with the measured density of charge. The electromagnetic oscillations generated by orbitrons are calculated as pressure waves and the results obtained are compared with the data. (9 refs.)

75215 Pions storage rings. G.Andlauer.
Proceedings of the International Conference on Nucleus-Nucleus Collisions (papers in summary form only received), East Lansing, MI, USA, 26 Sept.-1 Oct. 1982 (East Lansing, MI, USA: Michigan State Univ. 1982), p.143
The purpose of the paper is the project of pions storage rings that allow the direct collision between secondary particles. The linac injects the protons as projectiles in the synchrotron in order to obtain relativistic speeds. The projectiles react in the targets and drive secondary particles. The pions will be focussed and directed in storage rings so as to interfere at collision points that will provide a rich yield of unexpected results. (no refs.)

29.25 PARTICLE SOURCES AND TARGETS, PREPARATION AND TECHNOLOGY

(see also 07.77 Particle production and handling; targets)

75216 The application of adiabatic theorem to the beam dynamics in accelerators. Fang Shouxian, Guo Zhiyuan, Wu Yingzhi (Inst. of High Energy Phys., Acad. Sinica, Beijing, China). *Commun. Theor. Phys. (China)*, vol.1, no.4, p.515-25 (1982).

The adiabatic criterion and the formulae for calculating the increment of adiabatic invariant due to the nonadiabatic change of parameters in Hamiltonian are derived. The authors have found that this increment is quite small, even in the case where the Landau's adiabatic criterion is violated. (4 refs.)

75217 Storage of ultracold neutrons in a vessel long enough for β decay. Yu.Yu.Kosvintsev, V.I.Morozov, G.I.Terekhov. *JETP Lett. (USA)*, vol.36, no.9, p.424-7 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.346-9 (5 Nov. 1982). [received: June 1983]
Cooling a hermetically sealed aluminum vessel to 80K lowers the probability for the loss of ultracold neutrons to a level near the theoretical level. The additional loss in aluminum vessels is shown to be caused by a heating of the ultracold neutrons, for which the probability depends strongly on the temperature. A 'clean' vessel in which ultracold neutrons can be stored for a time equal to their lifetime with respect to β decay can be produced by freezing heavy ice on the surface of an aluminum vessel. (7 refs.)

75218 Laser polarization of accelerated protons. A.N.Zelenskii, S.A.Kokhanovskii, V.M.Lobashev, N.M.Sobolevskii (Inst. of Nuclear Res., Acad. of Sci., USSR). *JETP Lett. (USA)*, vol.36, no.10, p.433-5 (20 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.10, p.357-9 (20 Nov. 1982). [received: June 1983]

A method is proposed for using laser beams to polarize protons in a beam of fast hydrogen atoms. An intense atomic beam with an energy in the range 160-3000 MeV can be produced by neutralizing accelerated negative hydrogen ions. The implementation of this method would make it possible to produce a pulsed proton current two orders of magnitude higher than that obtainable by other methods. (3 refs.)

75219 Phase space cooling. S.van der Meer. *Phys. Bl. (Germany)*, vol.39, no.5, p.117-19 (May 1983). In German.
Cooling in particle beams is described as a process where oscillatory amplitude, beam cross section and breadth of the energy distribution curve are reduced by the subtraction of energy, for example by synchrotron radiation or by means of a spatially coincident energy absorbing beam. Models are drawn, energy distribution in an anti-proton beam is shown experimentally and the competition between energy gain from adjacent particles, at a rate proportional to amplification to the fourth power, and cooling at a rate linearly proportional to amplification, is illustrated. Stochastic cooling is mentioned and experimental work at CERN is illustrated. Particle storage of the order of 36000 pulses per day is claimed. Uses of beam cooling in Boson identification are reported. (3 refs.) G.M.E.

75220 Neutron yield from lead targets under radiation of electrons interacting with a single crystal. A.F.Antipenko, V.I.Kasilov, N.I.Lapin, S.F.Scherbak. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.655-7 (May 1983). In Russian.
Photoneutron yield from amorphous lead targets of various thickness is measured. An oriented or misoriented Si crystal and an amorphous Au target have been used as a photon converter. It is shown possible to increase the neutron yield from amorphous targets using a single crystal as a photon target. (12 refs.)

75221 SSRL Beam Line Wunder: Design and planning. R.Z.Bachrach (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), I.Lindau, M.H.Hecht, W.E.Spicer, L.E.Swartz, S.B.Hagstrom.
Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.3
The results of a design study and current planning are presented for a soft X-ray Synchrotron Radiation Beam Line utilizing a permanent magnet undulator insertion on SPEAR at the Stanford Synchrotron Radiation Laboratory. Modeling studies have shown that significant advantages can be obtained in the desired energy range 10-1000 eV using such a device rather than a bending magnet. The parameters which achieve this energy range best characterize the device as between a wiggler and an undulator. The authors have named this device a Wunder and are pursuing its implementation. Relative to a bending magnet, one gains approximately two orders of magnitude of useful flux and in addition, the horizontal beam divergence is reduced by approximately one order of magnitudes. (no refs.)

29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

75222 The polarization spectrograph 'DUMAS'. M.Nakamura, H.Sakaguchi, H.Sakamoto, H.Ogawa, T.Ichihara, M.Yosoi, S.Kobayashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *AIP Conf. Proc. (USA)*, no.97, p.425 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
The polarization measurement of emitted particles in nuclear reaction may play a significant role in the exploration of nuclear reaction mechanism, where the reaction may be induced by either polarized or unpolarized beam and even heavy ion beam. The polarization measurement should cover not only the emitted particles leading to the low-lying states but also those leading to the highly excited states of residual nuclei simultaneously. The authors have succeeded in design of a new separate function type polarization spectrograph with excellent performance characteristics, by introducing combined multipole fields into the system besides the separate field elements. The spectrograph named DUMAS (dual magnetic spectrograph) is now being installed in the experimental area for polarization measurement at RCNP. (no refs.)

75223 Influence of statistical experimental errors on amplitude correlations in resonance spectroscopy. H.M.Hofmann, T.Mertelmeier (Inst. für Theoretische Phys., Univ. Erlangen-Nürnberg, Erlangen, Germany), H.A.Weidenmüller. *Z. Phys. A (Germany)*, vol.311, no.4, p.289-95 (1983). Measurements taken at Triangle Universities on a running sequence of 53 d-wave resonances in ^{45}Sc strongly suggest that the reduced partial width amplitudes have a probability distribution which is not a multivariate Gaussian. The authors investigate whether this result could be caused by experimental statistical errors and find strong indications that this might indeed be the case. (6 refs.)

75224 Detection of radiation in the energy range 0.1 to 10 MeV by use of a nuclear gamma-ray spectrometer. W.M.Summers. Univ. Durham, England thesis, Feb. 1983.

An 86 cm², actively shielded Ge(Hp), nuclear gamma-ray spectrometer was flown from Palestine, Texas, USA, in August 1979, to a residual atmospheric pressure of 4.3 g cm⁻², by means of a high altitude balloon. The design, construction and response characteristics of the instrument, which has (a) an energy resolution of 2.5 keV at 1.33 MeV, (b) an opening angle of 5.2° (FWHM) and (c) a measured efficiency of 23% relative to a 3"×3" NaI(Tl) crystal, is described. Also presented are measurements of the gamma-ray lines which were detected at various atmospheric depths during the ascent phase of the flight. These features originate from secondary gamma production in the shield and Ge(Hp) crystal from atmospheric radiation 'leaking' through it.

29.40 RADIATION DETECTORS

(for mass spectrometers, see 07.75)

75225 Nutex experiment and the future of the Mont Blanc laboratory. G.Battistoni (Lab. Nazionali, INFN, Frascati, Italy), E.Bellotti, G.Bologna, P.Campagna, C.Castagnoli, V.Chiarella, D.C.Cundy, B.D'Ettore, Piazzioli, E.Fiorini, E.Iarocci, G.Mannocchi, G.O.Murtas, P.Negri, G.Nicoletti, P.Picchi, M.Price, A.Pullia, S.Ragazzi, M.Rollier, O.Saavedra, L.Trasatti, L.Zanotti. *AIP Conf. Proc. (USA)*, no.96, p.124-37 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

For 20 years garages in the Mont Blanc road tunnel have been used as cosmic-ray underground laboratories. In 1973 in one of these laboratories the authors carried out a proton decay experiment using one ton of liquid scintillator surrounded by a 4π anticoincidence shield. Of course no proton decays were found and gave a lifetime limit of $>10^{25}$ years. However, at the same time no background events were found, and it was clear that the Mont Blanc laboratory was ideal for this type of experiment. The laboratory is located deep underground; the minimum depth is ~5000 m.w.e. There is only one problem: the typical size of the garages is (8.6×8×6.5) m³, which limits the mass of the detector. Actual proton decay detectors fall into two classes: totally active water Cherenkov detectors, and tracking calorimeters. In October 1979, during a new proton decay experiment, Nutex, a digital calorimeter was made for several reasons: small laboratory size; experience in digital tracking calorimeter techniques; and the desire to get quick and good results. (5 refs.)

75226 IMB detector—the first 30 days. R.M.Bionta (Univ. of Michigan, Ann Arbor, MI, USA), G.Blewitt, C.B.Brattin, B.G.Cortez, S.Errede, G.W.Foster, W.Gajewski, M.Goldhaber, J.Greenberg, T.J.Haines, T.W.Jones, D.Kielczewski, W.R.Kropp, J.G.Learned, E.Lehmann, J.M.LoSecco, P.V.Ramana Murthy, H.Park, F.Reines, J.Schultz, E.Shumard, D.Sinclair, D.W.Smith, H.Sobel, J.L.Stone, L.R.Sulak, R.Svoboda, J.C.van der Velde, C.Wuest. *AIP Conf. Proc. (USA)*, no.96, p.138-42 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

A large water Cherenkov detector, located 2000 feet below ground, has recently been turned on. The primary purpose of the device is to measure nucleon stability to limits 100 times better than previous measurements. The properties of the detector are described along with its operating characteristics. (no refs.)

75227 The Harvard-Purdue-Wisconsin baryon decay experiment at Park City, Utah. D.B.Cline (CERN, Geneva, Switzerland).

AIP Conf. Proc. (USA), no.96, p.143-60 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

A large tank of water, instrumented with photomultipliers and surrounded by an active shield using proportional wire tubes is being constructed in an underground laboratory at Park City, Utah. Baryon decay can be separated from background using the Cherenkov light pattern to a lifetime of approximately 4×10^{32} years in three years of running time. The status of the experiment is reported here. (4 refs.)

75228 The Soudan nucleon decay experiments. L.E.Price (Argonne Nat. Lab., Argonne, IL, USA).

AIP Conf. Proc. (USA), no.96, p.161-7 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

Two nucleon decay experiments using the Soudan mine are discussed. Soudan 1 is currently taking data: It contains 31 tons, and is based on proportional tubes. It has set an upper limit of 1.0×10^{30} years on the lifetime of the nucleon. Soudan 2 is a proposal based on long drift chambers with an initial mass of 1000 tons, to be expanded to 5000 tons. (5 refs.)

75229 The nucleon decay experiment in the Frejus tunnel. J.Ernwein (CENS, Gif-sur-Yvette, France).

AIP Conf. Proc. (USA), no.96, p.175-81 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

The author describes a 1.5 kiloton fine grained flash chamber detector which will be installed in an underground laboratory in the Frejus tunnel near Modane, France. It will be dedicated to the search for nucleon decay. It will also be possible to search for monopoles and study multimions. (8 refs.)

75230 A proton decay and solar neutrino experiment with a liquid argon Time Projection Chamber. H.H.Chen, P.J.Doe, H.-J.Mahler (Univ. of California, Irvine, CA, USA).

AIP Conf. Proc. (USA), no.96, p.182-5 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

Recent progress in development of the liquid argon Time Projection Chamber is reviewed. Application of this technique to a search for proton decay and ^8B solar neutrinos with directional sensitivity is considered. The steps necessary for a large scale application of this technique deep underground are described. (9 refs.)

75231 Magnetic monopoles, nucleon decay and DUMAND. P.C.Bosetti (Phys. Inst., Tech. Hochschule Aachen, Aachen, Germany).

AIP Conf. Proc. (USA), no.96, p.186-9 (1982). [received: May 1983] (Workshop on Science Underground, Los Alamos, CA, USA, 1982).

A search for magnetic monopoles catalyzing baryon decay has been performed. The detector—a water filled tank equipped with photomultiplier tubes—was most sensitive for monopoles with velocities less than 0.001c and interaction lengths less than 50 cm. No monopole has been found leading to an upper limit of $F(M) < 1.6 \times 10^{-2} \text{ m}^{-2} \text{ sr}^{-1} \text{ d}^{-1}$.

75232 Apparatus for automatic track etching of SSNTDs. G.Streubel, C.Meide (Sektion Physik., Tech. Univ. Dresden, Dresden, Germany).

Radiat. Prot. Dosim. (GB), vol.4, no.1, p.43-5 (1983).

The apparatus for automatic track etching of SSNTDs described is an apparatus for carrying out the complete treatment from detector etching to detectors drying in one tank. This tank is connected with the containers for the different liquids necessary by pipes. The control of the etching treatment is performed electronically. The apparatus permits simultaneous etching of about 105 detectors and allows good reproducibility. (5 refs.)

75233 Some aspects and results of the electrochemical etching of a thin-film track detector. J.Olszewski, T.Domanski, M.Hawrynski, W.Chruscielowski (Inst. of Occupational Medicine, Lodz, Poland).

Nucl. Tracks & Radiat. Meas. (GB), vol.6, no.4, p.161-74 (1982).

The authors report the effects for the commercially available cellulose nitrate foil, namely Kodak LR-115 type 2. This foil was irradiated with alpha particles (from a ^{239}Pu source) and then treated electrochemically. They find that the maximums of the frequency resonance curves are located between 0.5-1.5 kHz and depend on the electric field strength, applied on the Kodak foil; whereas the field-strength-resonance curves have their maximums between 0.5-1.2 kV and also depend on the frequency. The 'appearance' (or emergence) effect of the latent tracks was used as a criterion of track-enhancement in the electrochemical etching. The results obtained, especially the shapes of frequency resonance curves, are in very good agreement with those curves that can be predicted from a theoretical consideration of the mechanisms of the electrochemical etching phenomenon. In the theory presented the authors consider the foil as a dielectric between two plates of a capacitor. It vibrates mechanically in the alternating electric field. This vibration increases the probability of the interaction between ions and the material to be etched. Also, the effect of an additional flux of the ions of electrolyte, due to the action of the alternating field in the etchant, is considered. Both the assumptions permit one to predict the shape of resonance curves and to find some of the characteristic parameters of track detector material. (33 refs.)

75234 Development of a new EPL-free etchant for soda-glass nuclear track detectors. M.Farid, A.P.Sharma (Dept. of Phys., Kurukshetra Univ., Kurukshetra, India).

Nucl. Tracks & Radiat. Meas. (GB), vol.6, no.4, p.175-84 (1982).

When soda-glass track detectors are etched in hydrofluoric acid (48 vol.%), the common etchant, an etch product layer (EPL) is formed on the detector surface which interferes with further etching. The authors report a new three-component etchant consisting of HF (12 vol.%), H_2SO_4 (24%) and H_2O in the ratio 12:2:9 for soda-glass detectors to overcome the adverse effects of EPL. They have studied bulk-etch rate, track-etch rate, etch-pit diameter, etching efficiency and energy resolution of soda glass detectors for fission-fragment tracks of ^{252}Cf by using this new etchant. A comparison of the results with those reported by earlier workers shows the superiority of the new etchant over the etchants used earlier. (13 refs.)

75235 Neutron-sensitivity calculations for simple albedo track detectors.

J.Palfalvi (Central Res. Inst. for Phys., Budapest, Hungary).

Nucl. Tracks & Radiat. Meas. (GB), vol.6, no.4, p.185-8 (1982).

The neutron sensitivity of Kodak-Pathe LR 115 type II cellulose nitrate track detector, with LiF , $\text{Li}_2\text{B}_4\text{O}_7$ and B_4C (n,α) radiators was investigated by calculations. (1 ref.)

75236 Relocating tracks and projection measurements at different stages of development in plastic detectors. M.Debauvais, J.Ralarosy, J.Tripier, M.Meyer, L.Oberle (Centre de Recherches Nucleaires, Strasbourg, France).

Nucl. Tracks & Radiat. Meas. (GB), vol.6, no.4, p.189-92 (1982).

The authors present a procedure for relocating correlated track segments at various stages during the chemical treatment of a plastic track detector. This is done with the aid of a millimetric grid fixed to the detector. Photographs show the effect for the $\text{Au}(u,x)$ interaction at 10 MeV/amu with a Makropol sheet detector. (2 refs.)

75237 A new track etchant for plastic detectors. T.Singh, M.Singh, S.Singh, H.S.Virk (Dept. of Phys., Guru Nanak Dev Univ., Amritsar, India).

Nucl. Tracks & Radiat. Meas. (GB), vol.6, no.4, p.197-9 (1982).

The authors investigate the etching ability of alkaline earth metal hydroxides on ^{252}Cf -irradiated Lexan. Successful results were obtained for $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$. (10 refs.)

75238 A simple system for rapid assessment of etch pits. J.R.Harvey, A.R.Weeks (CEGB, Berkeley Nuclear Labs., Berkeley, England).

Nucl. Tracks & Radiat. Meas. (GB), vol.6, no.4, p.201-6 (1982).

A technique which gives information on the size and number of alpha-induced etch pits in CR39 plastic is described. The pits, produced by etching the CR39 in hot sodium hydroxide, are filled with a paste composed of fine particles of a scintillator (ZnS:Ag) in ethylene glycol. The light pulses produced when samples of CR39, treated in this way, are exposed to a high-intensity alpha particle source, are detected and counted. The technique is likely to be simpler and less time-consuming than existing alternative methods. (3 refs.)

75239 Time dependence of the induced charge in closed ended HP Ge detectors. A.Alberigi Quaranta, A.Catellani (Univ. of Modena, Modena, Italy), M.Cuzzilla, G.Zanarini.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.3, p.1862-9 (June 1983).

Starting from energy balance considerations, the time dependence of the induced charge in closed ended HPGe gamma detectors is numerically determined as a function of detectors geometry, applied voltage and coordinates of created e-h pairs. These data can support the choice of geometry and applied voltage for the optimal use of closed ended detectors. (11 refs.)

75240 Carrier surface recombination in Hgl_2 photon detectors. A.Levi, M.M.Schieber (School of Appl. Sci. & Technol., Hebrew Univ. of Jerusalem, Jerusalem, Israel), Z.Burshtein.

J. Appl. Phys. (USA), vol.54, no.5, p.2472-6 (May 1983).

Carrier collection efficiency versus voltage characteristics were studied in detail in Hgl_2 photon detectors of various thicknesses for the 5.9 keV X-ray emission of ^{55}Fe . The results prove the important role of carrier surface recombination in limiting the carrier collection, and its consequences on the detector performances. Electron and hole surface recombination velocities in the samples were about 10^4 cm/sec. Hole trapping times were about 10^{-6} s.

sec, while electron trapping times were much longer than $\sim 10^{-5}$ sec. (23 refs.)

75241 A brief survey on progress and trends in nuclear radiation detectors. **I. Gas counters and liquid detectors.** E.Sakai (Div. of Reactor Engng., JAERI, Ibaraki, Japan). *Radioisotopes (Japan)*, vol.32, no.3, p.135-42 (March 1983). In Japanese. Detection of nuclear radiation requires transducers using a variety of physical principles. The interactions of nuclear radiations with matter produce phenomena which can be measured as electrical pulses and currents. All nuclear radiations produce ionization in matter, either directly or indirectly through secondary radiation. It is this characteristic ionization which forms the basis of almost all nuclear radiation detectors. Detectors may be divided into those which collect and measure the primary and secondary ions produced by the nuclear radiation, and those which observe and measure some secondary effect produced by this ionization. This paper briefly describes liquid ion collection devices and gaseous ion collection devices which include multiwire proportional counters, self-geunched streamer counters, gas scintillation counters and gas scintillation proportional counters. (32 refs.) *K.B.*

75242 (Neutron, α) magreakcion alapulo szilardtest nyomozométer hatásfokának elemleti és kísérleti vizsgálata ((Neutron, α) nuclear reaction solid track detector efficiency: Theoretical and experimental studies). J.Pál-falvi.

Report KFKI-1983-46, Hungarian Acad. Sci., Budapest (1983), 23 pp. In Hungarian.

The neutron sensitivity of Kodak-Pathe LR 115 II type cellulose nitrate track detectors with different (n, α) radiators was investigated by calculations and measurements. The α counting efficiency using an optical microscope is 95% for α particles with maximum energy of 2 MeV. When using an image analyser the etched through-tracks (holes) with diameter greater than 2 μ m are counted. The efficiency then depends only on the original and removed layer thickness but not on the etching temperature within the range of 40 to 60°C and the 2.5 to 6 N normality of the NaOH etchant. Efficiency varies from about 3 to 20% for alphas from the $^6\text{Li}(n, \alpha)\text{T}$ reaction if the removed layer lies in the range of ~ 7 to 10 μ m, and varies from ~ 2 to 10% for $^{10}\text{B}(n, \alpha)^7\text{Li}$ reaction alphas when the layer removal is ~ 8 to 10 μ m. (8 refs.)

29.60 COUNTING CIRCUITS AND NUCLEAR ELECTRONICS

75243 Electronic units for experimental investigations with the multisection detector 'Romashka' on the IRT-2000 reactor in Sofia. T.J.Grigorov, H.F.Muning, Ts.Ts.Pantelev. *Yad. Energ. (Bulgaria)*, no.18, p.70-4 (1983).

The general experimental set-up on the multiplicity spectrum measurements of the γ -rays from a single act of thermal neutron capture by the investigated nuclei has been described. The experiment is carried out with the aid of the twelve-sector scintillation detector 'Romashka'. A description of the signal level discriminator circuit with delay shaping and the duration of the output signals setting is given. The circuit of the accumulation, decoding and information display unit for the data from the 'Romashka' detector is presented. (4 refs.)

75244 Pulse shaper for time clamping to the rising edge of pulses in semiconductor detectors. A.A.Aleksandrov, V.A.Mokrousov, Yu.V.Pyatkov. *Instrum. & Exp. Tech. (USA)*, vol.25, no.4, pt.2, p.915-17 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.122-4 (July-Aug. 1982). [received: May 1983]

A pulse shaper is described for time clamping to the leading edge of preamplified current or voltage pulses in semiconductor detectors. Clamping is to the 0.5-0.9 amplitude level over a 4-100 nsec time range. For generator pulses with 5-nsec fronts, the error in time clamping is due to the dynamically changing amplitude and is ± 30 psec for a 6:1 dynamic range. The pulse shaper can be used to measure the rise times of pulses from surface-barrier or Ge(Li) detectors, or in time-of-flight spectrometers as a time marker. The pulse shaper is designed to conform to CAMAC standards and fits in a module of unit width. (5 refs.)

75245 Activity determination in samples of isotope mixtures by using sum peaks in Ge(Li) spectra. I.Uray, I.Torok, E.Gyarmati (Inst. of Nuclear Res. of the Hungarian Acad. of Sci., Debrecen, Hungary). *Acta Phys. Acad. Sci. Hung. (Hungary)*, vol.52, no.3-4, p.469-73 (1982). [received: May 1983] (Proceedings of the Hungarian-Austrian Health Physicists' Meeting, Gyor, Hungary, 28 Sept.-1 Oct. 1981).

The basic concept of the absolute activity determination based on sum peaks are briefly discussed. A possible extension of the method to measure the absolute activities of monoenergetic gamma sources is also given. (4 refs.)

75246 Calculation of radon and thoron daughters concentration by least squares. Zhang Chunzhang, Luo Daling. *Acta Sci. Nat. Univ. Sunyatseni (Zhongshandaxue Xuebao) (China)*, no.4, p.58-64 (1982). In Chinese.

The method of measuring radon and thoron daughters concentration during and after sampling is discussed and a versatile computer program for analyzing observed data of random and thoron daughters is written on the basis of the mathematical method of matrix and weighted least squares calculations. The program is suitable to calculate the concentration of radon and thoron, daughters from the total alpha counts and alpha spectroscopy data during and after sampling. The results of measurements show that greater accuracy of the concentration of radon and thoron daughters can be obtained by the weighted least squares calculation. (10 refs.)

75247 Low-density nuclear isomer and a possible explanation for the anomaly in the free path of nuclear fragments in photoemulsions. V.A.Khodel (I.V. Kurchatov Inst. of Atomic Energy, Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.7, p.325-7 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.265-7 (5 Oct. 1982). [received: May 1983]

An explanation is proposed for the anomalous behavior of the free path of nuclear fragments in photoemulsions. (10 refs.)

75248 ICRU recommendations on radiation quantities and units — a critical review. K.Katoh (Nat. Lab. for High Energy Phys., Ibaraki, Japan). *Radioisotopes (Japan)*, vol.32, no.3, p.127-34 (March 1983). In Japanese. This review paper comments on ICRU (International Commission on Radiation Units and Measurements) recommendations for radiation quantities and units. The ICRU's proposed relation for $d\epsilon/dm$ (given) is not trivial, although the relationship between the non-stochastic quantity D and the stochastic quantity z is formulated. The probability distribution $f(z)$ of z may vary with matter system size. (34 refs.) *K.B.*

75249 Calorimetry in high-energy physics. C.W.Fabjan (CERN, Geneva, Switzerland), T.Ludlam.

In book: *Annual review of nuclear and particle science*, Vol.32, J.D.Jackson, H.E.Gove, R.F.Schwitters [Ed.], p.335-89. Palo Alto, CA, USA: Annual Reviews (1982), 595 pp. [0 8243 1532 4]

The detection of particles is the experimental tool of high-energy physics research, and the evolution of the field has been closely coupled to the development of improved methods for detecting and measuring an ever-widening spectrum of particle properties. Much of our present knowledge about the physics of elementary particles has been the result of a continuing refinement of techniques for measuring the trajectories of individual charged particles—from the early hodoscopes, cloud chambers, and emulsion stacks, to today's extraordinarily precise bubble and streamer chambers and sophisticated magnetic spectrometers, equipped with multiwire proportional or drift chambers (Charpak et al. 1978, Fabjan and Fischer 1980). The authors examine an intrinsically different class of detector that has come to the fore over the past decade and promises to greatly influence the scope of future experiments—total absorption detectors or calorimeters. 75250 A multicrate link system for use with CAMAC auxiliary controllers designed at Daresbury Laboratory. J.Alexander, J.Howson (Daresbury Lab., Sci. & Engng. Res. Council, Warrington, England). *Interfaces Comput. (Switzerland)*, vol.1, no.2, p.171-9 (May 1983).

Many CAMAC systems using auxiliary controllers need to access more modules than will fit into a single CAMAC crate. The Daresbury Link enables several auxiliary controllers to access modules in up to seven crates almost as quickly and simply as though they were in a single crate. The link is processor independent. (3 refs.)

31.10 GENERAL THEORY OF STRUCTURE, TRANSITIONS AND CHEMICAL BINDING

75251 The hydrogen atom in strong magnetic fields: summation of the weak field series expansion. J.C. Le Guillou (Lab. de Phys. Theorique et Hautes Energies, Univ. Paris VI, Paris, France), J. Zinn-Justin. *Ann. Phys. (USA)*, vol.147, no.1, p.57-84 (15 April 1983).

Using the weak field expansion, the authors have calculated the ground-state energy of the hydrogen atom in a magnetic field for values of the field up to about 10^{13} G. The perturbative expansion has been summed by an order-dependent mapping method. The authors compare the results with previous calculations. The method allows one to obtain, first, more accurate values of the binding energy for a field up to 10^{10} G, then good results in the transition region between the two sets of accurate calculations of the literature, and finally still reasonably accurate values up to 10^{13} G. (42 refs.)

75252 On total π -electron energy of benzenoid hydrocarbons. I. Gutman, S. Petrovic (Faculty of Sci., Kragujevac, Yugoslavia). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.292-4 (20 May 1983).

Hall's observation that the total π -electron energy E of benzenoid hydrocarbons is a linear function of the number of Kekule structures is supported by theoretical arguments and extensive numerical work. A rather accurate topological formula for E is obtained. (4 refs.)

75253 Reduction of the excited state into the ground state of a super-Hamiltonian. J. Katriel (Dept. of Chem., Technion-Israel Inst. of Technol., Haifa, Israel).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1767-80 (May 1983). A reformulation of the Hylleraas-Undheim-MacDonald variational procedure for excited states, involving the application of Lowdin's supersecular equation to a variational problem concerning the ground state of an appropriate super-Hamiltonian, is proposed. Some formal applications are presented. (17 refs.)

75254 A formula for calculating molecular energy differences from electrostatic potentials at nuclei. P. Politzer, P. Sjöberg (Dept. of Chem., Univ. of New Orleans, New Orleans, LA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.7008-10 (1 June 1983). Presents an accurate procedure for predicting energy differences for certain types of isoelectronic molecules. It can be used to obtain reasonable estimates of molecular electron affinities; these are often difficult to evaluate by experimental or other theoretical approaches. The authors have shown that electrostatic potentials at nuclei computed with Hartree-Fock wave functions can indeed be used to obtain energy-related quantities that are consistently more accurate than if they have been determined directly from the Hartree-Fock energies. (11 refs.)

75255 Hyperspherical coordinates in four particle systems. Y. Ohn (Dept. of Chem. & Phys., Univ. of Florida, Gainesville, FL, USA), J. Linderberg.

Mol. Phys. (GB), vol.49, no.1, p.53-64 (May 1983). Explicit formulae are provided for the kinetic energy functional in hyperspherical coordinates for a four particle system in a parametrization where the total angular momentum and the moments of inertia are exhibited. Asymptotically linear states are seen to correspond to specific axes in a three dimensional space. (9 refs.)

75256 Topological indices based on topological distances in molecular graphs. A.T. Balaban (Organic Chem. Dept., Polytech. of Bucharest, Bucharest, Rumania).

Pure & Appl. Chem. (GB), vol.55, no.2, p.199-206 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

Three new distance-based topological indices are described; two of them, D and D_1 (mean distance topological indices, for any graphs, and for acyclic graphs, respectively) have a modest discriminating ability but may be useful for correlations, e.g. with octane numbers. The third index, J (average distance sum connectivity) is the least degenerate single topological index proposed till now. The properties of this promising index J are discussed in more detail. (34 refs.)

31.15 GENERAL MATHEMATICAL AND COMPUTATIONAL DEVELOPMENTS

75257 Preparation of small atomic Gaussian basis sets for molecular calculations. J. Andzelm, E. Radzio-Andzelm, M. Klobukowski (Dept. of Chem., Univ. of Alberta, Edmonton, Alberta, Canada).

THEOCHEM (Netherlands), vol.11, no.1-2, p.197-9 (June 1983). The atomic basis sets developed by Pople and co-workers [1980] have been examined and compared with those obtained by the authors, using the same idea of transferring the valence parts of the basis from a larger basis set to a smaller one. In the authors' basis sets, denoted as $(K21/21)$, no common exponents for s and p valence PGF were assumed. The basis set parameters were optimized using the RHF method as described by Huzinaga and co-workers. (5 refs.)

75258 A possible resurrection of the ab initio maximum overlap (MOM) method. M.A. Whitehead, G.D. Zeiss (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada).

Can. J. Chem. (Canada), vol.61, no.4, p.675-9 (April 1983).

A constrained variational theory is applied to the ab initio maximum overlap (MOM) method. The results for N_2 , HF, CO, and LiH, in which MOM wavefunctions satisfy constraints based on RHF, experimental or theoretical values, are discussed. The numerical results show that constraining the MOM wavefunctions with one or more constraints corrects the worst deficiencies in accuracy in the wavefunctions. (40 refs.)

75259 Integral evaluation algorithms and their implementation. D. Hegarty (Univ. of Groningen, Groningen, Netherlands), G. van der Velde.

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1135-53 (April 1983).

Three different algorithms for the calculations of many center electron-repulsion integrals are discussed, all of which are considered to be economic in terms of the number of arithmetic operations. The common features of the algorithms are as follows: Cartesian Gaussian functions are used, integrals are calculated by blocks (a block being defined as the set of integrals obtainable from four given exponents on four given centers), and functions may be adopted to $R(3)$. Adaptation to molecular point group symmetry is not considered. Tables are given showing the minimum number of operations for a selection of block types allowing one to identify the theoretically most economic, and the corresponding salient features. Comments concerning the computer implementations are also given both on scalar and vector processors. In particular, the Cyber 205 is considered, a vector processor on which the authors have implemented what they believe to be the most efficient algorithm. (19 refs.)

75260 Rayleigh-Schrodinger perturbation theory for many-electron systems with partitioning of configurations by orders of excitation. W.J. Taylor (Dept. of Chem., Ohio State Univ., Columbus, OH, USA).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1653-65 (April 1983).

Rayleigh-Schrodinger perturbation theory for many-electron systems has been rederived by an extension of Lowdin's partitioning method in which excited configurations are further partitioned by their orders (two equivalent definitions of the order of a configuration are given). The resulting equations show explicitly how first-, second-, and third-order configurations contribute to the first three orders of perturbative corrections to the ground-state wave function, and the first six orders of corrections to the energy. Because the partitioning is by orders of configurations (rather than level, i.e. single, double, etc., excitations) the formalism is unaffected by the applicability, or nonapplicability, of Brillouin's theorem. (14 refs.)

75261 Chemical graph theory. IV. On the cyclic polynomial. J. Seibert, N. Trinajstić (Rugjer Boskovic Inst., Zagreb, Yugoslavia).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1829-41 (May 1983).

For pt.III, see Chem. Acta, vol.54, p.309 (1981). The definition of the cyclic polynomial of conjugated hydrocarbons is offered. The combinatorial characteristics of this polynomial are investigated. The most important property of the cyclic polynomial is that it can be used for enumeration of conjugated circuits. (30 refs.)

75262 The constrained variational formulation of energy functionals. P. Westhaus (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6833-40 (1 June 1983).

Presents a generalization of the density functional formalism based upon constrained variations of the expectation value $\mathcal{E} = \langle \Psi | \hat{H} | \Psi \rangle$. The essential idea is to find the minimum value of \mathcal{E} with respect to a set of state vectors $S_a = \{ |\Psi_a\rangle \}$, each member of which yields the specified expectation values $q_i = \langle \Psi_a | \hat{A}_i | \Psi_a \rangle$ of set of observables \hat{A}_i , $i = 1 \dots M$. a denotes the collection of M expectation values q_i , $i = 1 \dots M$. If one or more N -electron vectors exist yielding the given M expectation values, a is said to be N representable. One thus obtains this minimum expectation value $E(a) = \min \mathcal{E}$ over S_a as a function of the assigned expectation values. In terms of the function $E(a)$, the exact ground state energy may be obtained by seeking its minimum value over all possible (N -representable) expectation values a . The traditional density functional formalism of Hohenberg and Kohn is seen to be a special case where the constraints are expressed by the expectation values of an indenumerable set of charge density operators, the members of which are indexed by the continuum of eigenvalues of the single particle position operator. The general ideas are illustrated by computing a function based upon constraining $(1/r)$ and $(1/r^2)$ for a one-electron atom. In this example, the formalism is carried out by solving a modified Schrodinger equation which includes Lagrange multipliers in order to take into account the constraints. The authors conclude, however, with an outline of how the unitary transformation formalism can be used to obtain the function $E(a)$ in a systematic fashion. (10 refs.)

75263 On the reliability of semi-empirical pseudopotentials: simulation of Hartree-Fock and Dirac-Fock results. P. Fuentealba, H. Stoll, L. von Szentpaly, P. Schwerdtfeger, H. Preuss (Inst. für Theoretische Chem., Univ. Stuttgart, Stuttgart, Germany).

J. Phys. B (GB), vol.16, no.11, p.L323-8 (14 June 1983).

Semi-empirical pseudopotentials can be modified in a simple way so as to reproduce frozen-core Hartree-Fock or Dirac-Fock results, respectively. The influence of relativistic effects is quantitatively discussed (i) for (r^4) expectation values and dipole polarisabilities of group IA and IB atoms, and (ii) for the bond lengths of K_2^+ and Cu_2 . (24 refs.)

75264 On the evaluation of the geometrical factors utilized in ligand polarization calculations. T. Meruane, R. Acevedo (Dept. of Chem. Engng., Univ. of Chile, Santiago, Chile).

Theor. Chim. Acta (Germany), vol.62, no.4, p.301-17 (1983).

Taking advantage of the irreducible tensor method put forward by T.S. Griffith (1962) in the case of molecular symmetry groups, both the molecular states and relevant operators can be classified in terms of irreducible representations of the molecular group in question, and therefore it is most convenient to express the relevant operators involved in any specific calculation in a symmetry adapted form. The authors deal with $d-d$ and $f-f$ type of transitions, and hence the 2^2 (electric quadrupole), 2^4 (electric hexadecapole) and the 2^6 -multipoles are considered in some detail. (14 refs.)

75265 Molecular orbital resonance theory: a new approach to the treatment of quantum chemical problems. T.P. Živković (Inst. 'Rudjer Boskovic', Zagreb, Yugoslavia).

Theor. Chim. Acta (Germany), vol.62, no.4, p.335-50 (1983).

An alternative approach to the treatment of the quantum chemical problems combining both, the MO and VB theory, is proposed. This approach retains the concept of resonance from the VB method, but it treats each particular bond in the MO sense. The method is illustrated with a few examples. Relative stabilities of benzene, pentalene and cyclobutadiene are derived. A Huckel $(4m+2)$ rule is derived for the annulenes. The charge polarisation in the case of the pentalene molecule is explained. A distortion of the pentalene molecule is considered and it is shown that within this approach the distortion depends on the charge polarisation. (23 refs.)

Computer generation of isomeric structures See Entry 75553

31.20 SPECIFIC CALCULATIONS AND RESULTS

- 75266** On the electronic structure of planar fluorinated amines and phosphines. D.S.Marynick (Dept. of Chem., Univ. of Texas, Arlington, TX, USA), D.C.Rosen, J.F.Liebman. *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.47-50 (June 1983). The lowest closed-shell singlet state of planar PF_3 has recently been shown to have a highest occupied molecular orbital of a_1' symmetry, rather than the normally expected a_2'' symmetry found in planar NF_3 and related species. A simple orbital interaction diagram is presented to rationalize this unusual state. The effects of HOMO-LUMO mixing on the inversion barriers of NF_3 , NCl_3 , PF_3 , PCl_3 , and AsF_3 are also investigated, and it is found that such mixing significantly reduces the calculated inversion barriers for most of these species. (9 refs.)
- 75267** Stabilities of isomeric bromonium ions $\text{C}_2\text{H}_5\text{Br}^+$. R.A.Poirier (Phys. Sci. Div., Scarborough Coll., Univ. of Toronto, Toronto, Ontario, Canada), G.R.Demare, K.Yates, I.G.Csizmadia. *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.137-41 (June 1983). Molecular orbital calculations are performed to determine the relative stability of the three isomeric or valence tautomeric structures of $\text{C}_2\text{H}_5\text{Br}^+$. A hydrogen bridged structure was also considered. (3 refs.)
- 75268** SCF and localized orbitals in ethylene: MBPT/CC results and comparison with one-million configuration CI. W.D.Laidig, G.D.Purvis, III, R.J.Bartlett (Univ. of Florida, Gainesville, FL, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.209-14 (13 May 1983). Many-body perturbation theory (MBPT) and coupled-cluster (CC) calculations are performed on the ethylene molecule employing canonical SCF and simple bond-orbital localized orbitals (LO). Full fourth-order MBPT [i.e. SDTQ MBPT(4)], CC doubles (CCD) and CC singles and doubles (CCSD) energies are compared with the over one-million configuration 'benchmark' CI calculation of Saxe et al. Though the SCF and LO reference determinant energies differ by 0.29706 hartree, the CCSD energy difference is only 1.7 mhartrees (mh). The authors' most extensive SCF orbital calculation, CCSD plus fourth-order triples, is found to be lower in energy than the CI result by 5.3 mh. (19 refs.)
- 75269** Molecular structure of orthosilicic acid and importance of (p-d) π bonding. An ab initio molecular orbital study. J.Saucer (Central Inst. of Phys. Chem., Acad. of Sci., Berlin, Germany). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.275-8 (20 May 1983). OH and SiO bond lengths, the SiOH bond angle, favoured conformations of the protons and rotational barriers are obtained from 6-31G* calculations (assuming a tetrahedral SiO_4 structure). The role of d orbitals on silicon and/or oxygen atoms is assessed and the origin of the rotational barriers for silanol protons is discussed. (17 refs.)
- 75270** Ab initio study of structure and stability of the dimer $(\text{LiBeH}_2)_2$. Alternative configurations with mono- and bi-nuclear anions. L.P.Sukhanov, A.I.Boldyrev, O.P.Charkin (Inst. of New Chem. Problems, Acad. of Sci., Ghermogolovka, USSR). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.4-5, p.373-7 (27 May 1983). The structure and stability of different configurations of the $(\text{LiBeH}_2)_2$ dimer are calculated within the Hartree-Fock-Roothaan method using STO-3G and double-zeta basis sets. The structure with a diboron-like anion $[\text{Be}_2\text{H}_2]^{2-}$ and two bridge Li^+ cations is favoured. The four nearest configurations are ≈ 10 -15 kcal/mole higher. A possible intramolecular rearrangement is discussed. (21 refs.)
- 75271** An improved two parameter omega technique for molecular orbital calculations. VI. Calculations on methyl substituted polycyclic aromatic hydrocarbons. H.O.Villar, E.A.Castro, F.M.Fernandez (Inst. de Investigaciones Fisicoquimicas Teoricas y Aplicadas, La Plata, Argentina). *Chem. Scr. (Sweden)*, vol.22, no.1, p.49-50 (1983). The improved two parameter omega technique is applied to calculate the pi-delocalization energies of the nearest positions to a single substrate ring fusion site in various polycyclic aromatic hydrocarbons. The PMO approximation is used and results are correlated with carcinogenic activity. Improvements with respect to simple Hückel results are noted. (12 refs.)
- 75272** Energy-band structure and charge distribution for BaC_6 . N.A.W.Holzwarth (Corporate Res.-Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA), D.P.Divincenzo, R.C.Tatar, S.Rabii. *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1223-30 (April 1983). An ab initio self-consistent calculation has been carried out for the electronic properties of BaC_6 . Energy bands and charge densities are presented for BaC_6 and compared with those of LiC_6 . The results show that the band originating from Ba states has a mixture of s and d character and the d component hybridizes appreciably with the π bands of graphite. The Fermi level intersects this band as well as the graphite π bands, giving rise to a complicated Fermi surface with several types of carriers. Depending on the type of volumetric partitioning, the charge transfer from Ba to graphite layers is determined to be between 0.7 and 1.0 electron per Ba atom. The calculated results are consistent with available transport and optical measurements. (14 refs.)
- 75273** Evaluation of GTO molecular integrals. F.E.Harris (Dept. of Phys., Univ. of Utah, Salt Lake City, UT, USA). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1469-78 (April 1983). Methods for evaluating the function $F_m(r)$ occurring in molecular integrals over Gaussian-type orbitals are reviewed and extended. Formulas based on Bessel function and continued-fraction expansions are analyzed. The recommended evaluation procedures, embodied in a portable computer program, involve Pade approximations for various argument intervals and use recursion in m . The program is economical in storage requirements and faster than those in current use. (14 refs.)
- 75274** Symmetry determined orbital and group overlap. Z.Qianer (Dept. of Chem., Xiamen Univ., Xiamen, China). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1479-92 (April 1983). The MO theory of structural polyhedrons is one of the basic subjects closely related to the bonding theory of complex compounds and clusters. A series of valuable papers on this subject have been contributed by Hoffman (1977), Wade (1976), King (1977) and Lauher et al. (1977). A method called 'group overlap method' for constructing the symmetry orbitals and for calculating the group overlap integrals is proposed. It is hoped that the group overlap method may be used for the qualitative and quantitative MO study of structural polyhedrons. (13 refs.)
- 75275** Quantum chemical structure-activity relationships on β -carbolines as natural monoamine oxidase inhibitors. M.Martin, F.Sanz, M.Campillo, L.Pardo, J.Perez, J.Turmo (Dept. Bioestadística, Univ. Autónoma de Barcelona, Barcelona, Spain), J.M.Aullo. *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1643-52 (April 1983). The electron density and the molecular electrostatic potential of the β -carbolines are studied using ab initio STO-3G wave functions. The analysis was done from the point of view of a previous model built with monoamine oxidase substrates and irreversible inhibitors. The results confirm the usefulness of the model and make it possible to propose new precision to the molecular electrostatic potential patterns needed to have monoamine oxidase inhibitory activity. (10 refs.)
- 75276** One-electron properties at the SCF ab initio level. G.De Brouckere (Van Der Waals Lab., Univ. of Amsterdam, Amsterdam, Netherlands). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1677 (April 1983). Summary form only given. The extent to which the Hartree-Fock single configuration model is capable of predicting the expectation values of a broad variety of one-electron observables measured in a wide range of organic molecules involving first and second row atoms is explored. An answer to this problem has been obtained through extended basis set calculations (p-type and d-type polarization functions used) of definite one-electron observables: electric dipole, and quadrupole moments, diamagnetic susceptibilities, second moment charge distribution anisotropies, ionization potential, nuclear (^{14}N , ^{17}O , ^{33}S) quadrupole coupling constants and deuteron coupling constants. (4 refs.)
- 75277** Ab initio MO calculations of benzene+TCNE and naphthalene+TCNE complexes with STO-3G π -split basis set. Y.Watanabe (Dept. of Chem., Faculty of Sci., Osaka City Univ., Osaka, Japan), H.Kashiwagi. *Int. J. Quantum Chem. (USA)*, vol.23, no.5, p.1339-52 (May 1983). Ab initio SCF MO calculations have been carried out on benzene+TCNE (tetracyanoethylene) and naphthalene+TCNE complexes with the STO-3G, STO-3G π -split (STO-3G for σ orbitals and a split basis for π orbitals), and 4-31G basis sets. The interaction energy, gross charges, dipole moment, and the electron density in the middle plane of the complexes have also been evaluated. The STO-3G π -split basis set is appropriate for the calculation of large π - π stacking complexes from two points of view, production of reliable results and ease of computations. The approximation scheme based on the semiorthogonalized orbitals is revealed to be very efficient to save CPU time and storage in such calculations. The stable conformation and the charge-transfer interaction of the two complexes are discussed on the basis of the calculated quantities. (16 refs.)
- 75278** Applicability of non-degenerate many-body perturbation theory to quasidegenerate electronic states: a model study. S.Wilson (Dept. of Theoretical Chem., Univ. of Oxford, Oxford, England), K.Jankowski, J.Paldus. *Int. J. Quantum Chem. (USA)*, vol.23, no.5, p.1781-802 (May 1983). The nondegenerate finite-order many-body perturbation theory is applied to simple model systems in which the degree of quasidegeneracy can be continuously varied over a wide range. Three ab initio minimum basis set models involving four hydrogen atoms in various spatial arrangements are considered. The results are compared with the exact full configuration-interaction approach, double-excitation configuration-interaction and the coupled-pair many-electron theory. (56 refs.)
- 75279** Ab initio calculation of the $X^1\Sigma^+$ state of CsH . B.C.Laskowski (Analatom Inc., Sunnyvale, CA, USA), S.P.Walch, P.A.Christiansen. *J. Chem. Phys. (USA)*, vol.78, no.11, p.6824-32 (1 June 1983). Relativistic effective core potential (RECP) and nonrelativistic all electron (NRAE) calculations are reported for the $X^1\Sigma^+$ state of CsH . The calculations are based on GVB plus single and double excitation CI wave functions with the $\text{Cs}(5s, 5p)$ as well as the two valence electrons correlated. The bonding in CsH is found to involve a $\text{Cs}(6s)\text{-H}(1s)$ bond but with a significant ionic (Cs^+H^-) component. Correlating the $\text{Cs}(5s, 5p)$ electrons leads to a significant bond shortening effect ($\sim 0.15a_0$). The effect is attributed to a contraction of the $\text{Cs}(6s)$ orbital and a shift toward higher energy of the Cs^+H^- asymptote upon correlating the $5s, 5p$ shell. Bond shortening due to relativistic contraction of the $\text{Cs}(6s)$ is only $\sim 0.05a_0$ in agreement with the small amount of $\text{Cs}(6s)$ character in the ionic bond orbital. The NRAE and RECP potential curves are very similar except for the shorter R_e for the RECP case (due to relativistic bond contraction). (26 refs.)
- 75280** Hyperfine structure in 6snd Rydberg configurations in barium. E.R.Eliel, W.Hogervorst (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands). *J. Phys. B (GB)*, vol.16, no.11, p.1881-93 (14 June 1983). The hyperfine structure of the 6snd Rydberg configurations of barium has been investigated using a two-step excitation process and an atomic beam. Accurate hyperfine energies have been obtained on both the ^1D and ^3D levels, which are analysed in terms of singlet-triplet mixing. The mixing coefficients extracted for the $^1\text{D}_2$ and $^3\text{D}_2$ levels are shown to be internally consistent, to agree with known Landé factors and can well be predicted with existing multichannel quantum defect analyses. Finally the asymptotic behaviour of the singlet-triplet mixing coefficient is discussed in the framework of simple atomic theory. (26 refs.)
- 75281** Characteristic and matching polynomials of benzenoid hydrocarbons. I.Gutman (Faculty of Sci., Univ. of Kragujevac, Kragujevac, Yugoslavia). *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, pt.3, p.337-45 (March 1983). The characteristic and matching polynomials of the molecular graph of a benzenoid hydrocarbon are examined and a number of results proved for their coefficients. These results are then applied to the theory of topological resonance energy (TRE). It is demonstrated that all benzenoid hydrocarbons have positive TRE values and that the TRE model leads to absurd results in the case of polycyclic benzenoid systems. (10 refs.)
- 75282** Bicyclo(6.2.0)decapentaene [Molecular mechanics calculations]. N.L.Allinger, Y.H.Yuh (Dept. of Chem., Univ. of Georgia, Athens, GA, USA). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.191-7 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982). Molecular mechanics calculations (MMP2) on the title compound and related molecules, cyclobutadiene, cyclodecapentaene and others are described. Heats of formation, resonance energies and molecular structures were obtained, and where experimental comparisons are possible, the agreement is good. (19 refs.)

75283 On the role of Kekule valence structures. M.Randic (Dept. of Math. & Computer Sci., Drake Univ., Des Moines, IA, USA). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.347-54 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

Individual Kekule valence structures of conjugated hydrocarbons are examined and the relative role of the opposing 'aromatic' and 'antiaromatic' contributions scrutinized. The work follows previously proposed classifications of conjugated systems based on the enumeration of $4n+2$ and $4n$ conjugated circuits. In the present work attention is drawn to molecular formulae obtained by a partial superposition of selected Kekule valence structures and the situations in which they may play the dominant role and represent molecules adequately. (18 refs.)

75284 Relativistic atomic level calculations with nuclei carrying additional fractional charges. K.Rashid (Nuclear Phys. Div., Pakistan Inst. of Nuclear Sci. & Technol., Rawalpindi, Pakistan), B.Fricke. *Z. Phys. A (Germany)*, vol.311, no.4, p.283-7 (1983).

One-electron energy levels and wavelengths have been calculated for Na-like ions whose nuclei carry quarks with additional charges $\pm e/3$, $\pm 2e/3$. The calculations are based on relativistic self-consistent field procedures. The deviations from experimental values exhibit regularities which allow an extrapolation for the wavelengths of $3s-3p$, $3s-4p$, $3p-3d$, and $3p-4s$ transitions for the nuclear charge $Z=11\pm 1/3$, $\pm 2/3$. A number of transitions are found in the region of visible light which could be used in an optical search for quark atoms. (7 refs.)

31.20E Ab initio LCAO and GO SCF calculations

75285 Charge, bond order and valence in the ab initio SCF theory. I.Mayer (Central Res. Inst. for Chem., Acad. of Sci., Budapest, Hungary). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.270-4 (20 May 1983).

An operator of atomic charge is introduced, the expectation values of which are Mulliken's gross atomic populations on the individual atoms. Suitable definitions of the bond order (multiplicity) index and of the valence number of an atom in a molecule are also proposed for the SCF LCAO MO method. (The results apply also in the extended Hückel method). (6 refs.)

75286 Electronic structure of small copper clusters. E.Miyoshi (Fukuoka Dental Coll., Fukuoka, Japan), H.Tatewaki, T.Nakamura.

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1201-7 (April 1983).

An all-electron ab initio LCAO-MO SCF calculation has been carried out for the electronic structure of small copper clusters (Cu_n , $n=2-6$). The basis set superposition error occurring in the calculation, the equilibrium configuration of Cu_3 , the bond energy in the clusters, and the localized d -hole in excited and ionized states of Cu_2 are closely examined. (14 refs.)

75287 Three-body nonadditive effects for hydrogen bonded water molecules: SCF study of hydrated species including H_2S and various metal ions. O.Novaro (Inst. de Física, Univ. Nacional Autónoma de México, México City, México).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1611-25 (April 1983).

The relative importance of purely nonadditive three-body terms in solvated systems is assessed through ab initio LCAO-MO-SCF studies of hydrogen bonded structures containing two or more water molecules plus a solvate species. Among the latter the cases of Li^+ , Ca^{2+} , and Mg^{2+} ions (of biological interest for aminoacid release processes in membrane transport) and of HDS molecules (of industrial importance in processes for the production of heavy water) are studied. (25 refs.)

75288 Theoretical study of degree of covalency in some $\text{CoF}_6^{(n-)} \text{ complexes}$ ($n=4,3$, and 2). E.Miyoshi, S.Obata, T.Takada, H.Kashiwagi, K.Ohno (Dept. of Chem., Faculty of Sci., Hokkaido Univ., Sapporo, Japan).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1753-65 (May 1983).

On the basis of a high-quality LCAO MO SCF calculation, covalency versus ionicity of a Co-F bond in the $\text{CoF}_6^{(n-)} \text{ complexes}$, where $n=4,3$, and 2, is discussed. The overlap and gross atomic populations, delocalization of certain MOS, and the charge densities in the bond region as well as around Fs all indicate that the covalency increases as n decreases or the valency of Co increases in these complexes. (12 refs.)

31.20G Other accurate, or nearly ab initio calculations (DIM method, SAMO method, etc.)

75289 Relativistic MS $X\alpha$ calculations of the electronic structure and related properties of PtCl_6^{2-} . A.Goursot, E.Penigault (Lab. de Photochimie Generale, Ecole Nat. Supérieure de Chimie de Mulhouse, Mulhouse, France), H.Chermette.

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.215-20 (13 May 1983).

Relativistic MS $X\alpha$ calculations have been performed on a PtCl_6^{2-} cluster in O_h symmetry. The electronic structure is discussed and compared with the electronic structure obtained recently for IrCl_6^{3-} . The theoretical photoionization and optical spectra are in very good agreement with experiment. (25 refs.)

75290 Revisit to the electron density, bond order, and aromaticity. H.Hosoya, M.Shobu, K.Takano, Y.Fujii (Dept. of Chem., Ochanomizu Univ., Tokyo, Japan).

Pure & Appl. Chem. (GB), vol.55, no.2, p.269-76 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

Spatial distribution of electrons in a molecule is analyzed by several different approaches, i.e., MO, VB, and graph-theoretical methods. Quantum chemical

interpretation of the concept of the oxidation number was obtained by ab initio MO calculation. The concepts of the local structure character and partial electron density are proposed and discussed. (42 refs.)

The Cooper minimum in Cl_2 See Entry 75446

31.20N Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCILO methods, etc.)

75291 Dipole moments of fluorobenzenes by CNDO and INDO methods. S.Doraiswamy (Chem. Phys. Group, Tata Inst. of Fundamental Res., Bombay, India), S.D.Sharma.

THEOCHEM (Netherlands), vol.11, no.1-2, p.63-71 (June 1983).

The dipole moments of fluorobenzenes are evaluated by CNDO/2 and INDO molecular orbital calculations from reasonably assumed geometries. The results are compared with experimentally obtained values. It is found that both methods overestimate the dipole moments, the overestimation being more for INDO calculations. The disparity between the observed and calculated values of dipole moments increases with the addition of fluorines. To a good approximation, the charge densities at different positions in monofluorobenzene are sufficient to generate the electronic distribution pattern in higher members of the series. (20 refs.)

75292 Theoretical investigations of the interaction of but-2-ene with a sodium ion. R.Lochmann, W.Meiler, Th.Weller (Sektion Phys., Karl-Marx-Universität, Leipzig, Germany).

THEOCHEM (Netherlands), vol.11, no.1-2, p.73-7 (June 1983).

Investigation of the conformational behaviour of but-2-ene (cis and trans) and the interaction with a sodium ion is carried out by ab initio STO-3G, CNDO/2, and PCILO methods. Unlike the semiempirical results, the ab initio calculations predict that the isolated trans conformer is more stable than the cis form, in agreement with experimental data. All methods indicate a nearly free methyl group rotation. The interaction energy of a but-2-ene molecule with a sodium ion calculated by these methods shows different minima corresponding to different stable arrangements of the sodium ion in the but-2-ene/ Na^+ complex. In contrast to isobutene and but-1-ene, electrostatic effects are not important. An arrangement with the cation above the double bond seems to be most favoured owing to the dominating transfer interaction. (17 refs.)

75293 A theoretical study of the structure, charge distribution and gas-phase basicity of 1H-indazole and its N -methyl derivatives. J.Catalan, O.Mo, P.Perez, M.Yanez (Dept. de Química Física y Química Cuántica, Univ. Autónoma de Madrid, Madrid, Spain).

THEOCHEM (Netherlands), vol.11, no.1-2, p.143-53 (June 1983).

The authors have done ab initio calculations, using an STO-3G minimal basis set, for 1H-indazole and its N -methyl derivatives, to illustrate that important structural differences exist between the two tautomers and that appreciable geometrical changes take place upon methyl substitution. Theoretical geometries, fully optimized at INDO level, are reported. The variations observed in the structures of the two tautomers are explained in terms of σ -valence-shell electron-pair repulsions and of changes in the π -densities of the HOMOs of these compounds. It was also found that the tricoordinated nitrogen atom in 2-methylindazole (N_2) is a much stronger π -donor center than N_1 in the 1-methyl derivative, explaining some of the properties of these species. The calculated PAs indicate that these compounds are nitrogen bases and that the 2-methyl derivative is a much stronger base than the 1-methyl analog. The authors' calculated charge densities reproduce well the most important features of the ^{13}C and ^{14}N NMR spectra of these molecules. (30 refs.)

75294 On the stability of [furan] $^+$ and [vinylketene] $^+$. E.Canadell, J.P.Sarasa (Facultat de Química, Univ. de Barcelona, Tarragona, Spain).

THEOCHEM (Netherlands), vol.11, no.1-2, p.193-5 (June 1983).

Both the furan and the vinylketene structures have been proposed for the nonfragmenting $[\text{C}_4\text{H}_4\text{O}]^+$ ions generated by loss of CO from 2- and 4-pyrone molecular ions. Holmes and Terlouw [1979] reported on the thermochemistry of the neutral and ionic structures and concluded that [vinylketene] $^+$ was more stable than [furan] $^+$ by 3 kcal mol $^{-1}$. As part of a general theoretical study of the $[\text{C}_4\text{H}_4\text{O}]^+$ potential energy surface, the authors present some evidence in favor of the thermochemical estimation. The calculations reported are of the MINDO/3 type and the geometries were determined by minimization of the energy with respect to all the geometrical variables. (5 refs.)

75295 Conformational and MO studies of hydroxy-2-aminotetralins. D.Kocjan, T.Solmajer, M.Hodoscek, D.Hadzi (LED-Chem. & Pharmaceutical Works, Ljubljana, Yugoslavia).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1121-33 (April 1983).

Attempting to explain the differences in the pharmacological profiles of the isomeric monohydroxy- and dihydroxy-2-aminotetralins (DHAT) which are potent dopaminergic agonists the authors have calculated the conformational energies of 2-aminotetralin and its N,N -dipropyl derivative using the QCFF/PI and PCILO methods. Molecular electrostatic potential (MEP) maps based on ab initio (STO-3G) wave functions were computed for both dihydroxytetralins. Root-mean-square (RMS) deviations from steric congruence between the enantiomeric 5,6- and 6,7-DHAT based either on atomic centers or on the minima in MEP near the putative points of attachment to the receptor are small, but may nevertheless be sufficient to cause differences in activity on subtypes of the dopamine receptor. N,N -dipropyl substitution influences of conformational energies of the skeleton and the preferences in the orientation of the propyl groups in the isomeric DHAT may be important for the interaction with the receptor. The HOMO energies of the isomeric HAT and DHAT do not correlate with their potencies. (30 refs.)

75296 INDO studies on the electronic structure of lanthanoid compounds. Li Le-min, Ren Jing-ong, Xu Guang-xian, Wang Xiu-zhen (Dept. of Chem., Peking Univ., Beijing, China).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1305-16 (April 1983).

Expressions needed in INDO calculations for compounds containing 4f elements were derived and an INDO program suitable for lanthanoid compounds was written and tested. Electronic structure of LnF_3 and paramagnetic shift of NMR spectra of LnF_6^{3-} were studied. (24 refs.)

75297 Conformational studies of the $\beta(1\rightarrow3)$ linked disaccharide component of the immunologically active pentasaccharide of the Forssman antigen. J.S.Yadav, P.Luger (Inst. of Crystallography, Free Univ. Berlin, Berlin, Germany).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1433-9 (April 1983).

Conformational energy calculations of the PCILO level of approximation were performed on $\beta(1\rightarrow3)$ linked disaccharide consisting of N -acetylglucosamine and galactose of the Forssman antigen to examine the side group conformations and their influence on the mutual orientations of the two pyranosyl rings. Two low energy regions for the glycosidic bond conformations have been located in the grid search using classical potential functions. The PCILO

energy minimizations were then carried out in each of these regions. The preferred orientations of the nonreducing pyranosyl ring relative to the reducing ring were found to be in agreement with the available X-ray results. Moreover, the orientations of groups attached to the anomeric carbons were in good accordance with the requirements of the *exo*-anomeric effect. (13 refs.)

75298 Quantum chemical studies on the conformational structure of bacterial peptidoglycan. V. PCILO calculations on $\beta(1\rightarrow4)$ linked disaccharide of N-acetylglucosamine and N-acetyl muramic acid. J.S.Yadav (Inst. of Crystallography, Free Univ. Berlin, Berlin, Germany). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1441-50 (April 1983). For pt.IB see J. Theor Biol., vol.95, p.285 (1982). The glycan moiety of the bacterial peptidoglycan consists of alternatingly $\beta(1\rightarrow4)$ linked disaccharides of N-acetylglucosamine (NAG) and its 3-O-D lactic derivative, N-acetyl β -D-muramic acid (NAM). PCILO conformational energy calculations have been carried out for NAG-NAM and NAM-NAG disaccharides to see whether or not the glycan strands possess a chitinlike structure as suggested by earlier workers. In agreement with recent experimental findings, the present results also suggest that the chitinlike structure is energetically disallowed. Furthermore, the bulky N-acetyl substituents at C₂ positions of the two sugar molecules are found to be relatively less important in stabilizing mutual orientations of the two pyranosyl rings. (12 refs.)

75299 Ab initio MODPOT/VRDDO/MERGE calculations on energetic compounds. III. Nitroexplosives: polyanilinopolynitrobenzenes (including DATB, TATB, and Tetryl). P.C.Hariharan, W.S.Koski, J.J.Kaufman. *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1493-504 (April 1983). Quantum chemical ab initio MODPOT/VRDDO calculations have been carried out on the following aminonitrobenzenes for which crystal structures had been determined experimentally: 4-nitroaniline; N,N-dimethyl-p-nitroaniline; 2,4,6-trinitroaniline; 1,3-diamino-2,4,6-trinitrobenzene (DATB-Form I); 1,3,5-triamino-2,4,6-trinitrobenzene (TATB); 2,3,4,6-tetranitroaniline; N-methyl-N,2,4,6-tetranitroaniline (Tetryl); and N-(β,β -trifluoroethyl)-N,2,4,5-tetranitrobenzene. These quantum chemical calculations were performed on the molecules in their conformations as found in their crystal structures. The calculations were carried out with ab initio programs which also incorporate as options several desirable features for calculations on large molecules: ab initio effective core model potentials (MODPOT) which enable calculations of valence electrons only explicitly, yet accurately, and a charge conserving integral prescreening evaluation (named VRDDO-variable retention of diatomic differential overlap) especially effective for spatially extended molecules. Aminonitrobenzenes are especially interesting since there are inherent intramolecular ring distortions and deviations from planarity and intramolecular hydrogen bonds as well as intermolecular hydrogen bonds causing further deviations from planarity. The theoretical indices resulting from the quantum chemical calculations are relevant to a number of properties and behavior characteristics of these molecules, both intramolecular and intermolecular. (29 refs.)

75300 Molecular orbital study of the relationship between the electronic structure and toxicity of silatranes. Liu Ruo-Zhuang, Zheng Shi-Jin, Yu Jian-Guo (Dept. of Chem., Beijing Normal Univ., Beijing, China). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1609-10 (April 1983). Silatranes are a class of heterocyclic derivatives of 5-coordinate silicon with general formula $\text{XSi}(\text{OCH}_2\text{CH}_2)_3\text{N}$. They are characterized by the unusual valency of the silicon atom and toxicity. The toxicity of this series of compounds varies mainly with the nature of the substituents at the silicon atom. The authors study the relationship between the electronic structure and toxicity of silatranes using semiempirical SCF MO calculations using the CNDO/2 method. (5 refs.)

75301 Calculation of excited-state properties of some small molecules: comparative study of the CNDO/S and CNDO/2- V_{N-1} potential methods. A.B.Sannigrahi (Dept. of Chem., India Inst. of Technol., Kharagpur, India), D.C.Mukherjee, B.R.De.

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1695-705 (May 1983). The transition energy and geometry of the lowest excited ($\pi\pi^*$) singlet and triplet states of CO, CS, HNO, H₂CO, HFCO, and F₂CO molecules are calculated by CNDO/S and CNDO/2- V_{N-1} potential methods, and the results are compared with those of experimental and ab initio theoretical studies, wherever available. In the calculation of the vertical transition energy, the performance of the CNDO/S method is seen to be generally more satisfactory than that of the CNDO/2- V_{N-1} potential method, while the reverse is true for the excited-state geometry. The CNDO/S method as such fails to describe the geometry of the excited state, but a combined version (CNDO/S-2) of CNDO/S and CNDO/2, as well as the CNDO/2- V_{N-1} potential method is fairly successful in this regard. (40 refs.)

31.20P Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)

75302 Evaluation of HOMO-LUMO separation and homologous linearity of conjugated molecules. Yuan-sun Kiang, Er-ting Chen (Inst. of Theoretical Chem., Jilin Univ., Changchun, China). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.283-8 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

A variational method for calculating the HOMO and LUMO energies in the framework of Hückel theory is proposed. Graphical technique is employed for the evaluation of inverse adjacency matrix and collection of Dewar numbers is selected as a trial vector. Closed formulae for a few homologous series of conjugated hydrocarbons are deduced, which offer approximate HOMO (or LUMO) values with an average deviation less than 0.003. These formulae can

be used as 'homologous linearity' functions for rationalizing some of physico-chemical behaviours of conjugated homologs. (14 refs.)

A comparison of various MO methods for predicting regioselectivity in Diels-Alder reactions See Entry 77863

31.20R Valence bond calculations (ab initio or not)

75303 Applications of molecular orbital-valence bond theory in chemistry. N.D.Epiotis (Dept. of Chem., Univ. of Washington, Seattle, WA, USA). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.299-306 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

According to molecular orbital-valence bond (MOVB) theory, ground state organic molecules can be viewed as the result of 'forbidden' union of two fragments. Consequently, the stability of a molecule is a function of the fragment excitation requirement for its formation and chemical stereoselection a manifestation of fragment excitation reduction. The π electronic structure of benzene and the conformational isomerism of N₂H₄ and its derivatives are two simple illustrators of how and why MOVB theory has revolutionized the thinking about the structure and reactivity of molecules. (7 refs.)

75304 Valence bond theory for conjugated hydrocarbons. D.J.Klein (Dept. of Marine Sci., Texas A&M Univ., Galveston, TX, USA). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.299-306 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

Semiempirical valence bond theory for conjugated π -electron systems is reconsidered, with special attention being directed to common criticisms of the theory. Especially in light of recent results, flaws in the criticisms are revealed. (69 refs.)

31.20T Electron correlation and CI calculations

75305 The dissociation energy of Cu₂: do we want to perform multi-reference singles and doubles CI's on many-electron systems? C.W.Bauschlicher, Jr. (NASA Ames Res. Center, Moffett Field, CA, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.204-8 (13 May 1983).

SDCI and restricted POLCI calculations are reported for Cu₂ using a CAS SCF reference space with the 4s and 4p orbitals defined as active. D₀ at the POLCI level is substantially better than for SDCI. The difference is attributed to size-consistency problems associated with including the 3d correlation in SDCI. A modification to either standard POLCI or SDCI is suggested. (18 refs.)

75306 Nature and location of excited charge-transfer states in the porphine-magnesium porphine dimer. J.D.Petke, G.M.Maggiora (Dept. of Chem., Univ. of Kansas, Lawrence, US, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.231-5 (13 May 1983).

The ground and excited states of a cofacial porphine-magnesium porphine dimer with a ring separation of 5.35 Å are investigated by ab initio configuration interaction calculations, using a floating Gaussian basis. A pair of charge-transfer states are found $\approx 23000\text{ cm}^{-1}$ above the ground state, but are lowered by $\approx 7400\text{ cm}^{-1}$ upon coordination of the Mg atom with chloride ion. (12 refs.)

75307 CNDO calculations of halogen-substituted diformamides. G.Ramana Rao, V.Venkata Chalapathi (Dept. of Phys., Univ. Coll., Kakatiya Univ., Warangal, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.188-9 (March 1983). CNDO/2 calculations are made for diformamide C-fluorodiformamide and C-chlorodiformamide in trans-trans, trans-cis and cis-cis configurations. The charges, bond orders and dipole moments are discussed. (10 refs.)

75308 Electron correlation in linear hydrogen chains. J.G.Fripiat, J.Dehalle, J.M.Andre (Lab. de Chimie Theorique Appliquee, Facultes Univ. N.D. de la Paix, Namur, Belgium).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1179-89 (April 1983). The Moller-Plesset perturbation technique and configuration interaction methods are applied to linear chains of hydrogens in order to analyze the role of electron correlation on equilibrium geometries and binding energies of these systems. (17 refs.)

75309 Coordinate rotation studies of H⁻, He⁻, Be⁻, Mg⁻ resonances: basis set and configuration list dependence. D.T.Chuljian, J.Simons (Chem Dept., Univ. of Utah, Salt Lake City, UT, USA).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1723-38 (May 1983). The authors have performed coordinate rotated configuration interaction calculations on well-studied Feshbach resonances of H⁻ and He⁻ and on ²P shape resonances of Be⁻ and Mg⁻. The focus of the authors effort was the dependence of computed resonance energies on both the quality of the atomic-orbital basis and the level of treatment of electron correlation. Their results indicate that great care must be taken to guarantee that a basis is adequate; commonly used quantum-chemistry bases are probably far from satisfactory. Their findings also indicate that a proper treatment of inner-shell orbitals within coordinate rotation calculations is a formidable task. The authors are therefore encouraged to look carefully for modified coordinate rotation techniques that focus on the active valence-level orbitals and may avoid spurious complex energies arising from improper treatment of inner shells. (17 refs.)

75310 Electronic correlation contribution to the three-body potentials for water trimers. P.Habitz, P.Bagus, P.Siegbahn, E.Clementi (IBM Corp., Poughkeepsie, NY, USA).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1803-6 (May 1983). A number of trimers of water molecules have been computed with an extended basis set in the Hartree-Fock and in the direct CI approximations. It has been verified that the three-body interaction energy can be calculated within the Hartree-Fock method. Therefore, the correlation corrections to the Hartree-Fock level are essentially additive and do not contribute significantly to three-body effects. (26 refs.)

75311 Force field calculations for in-plane vibrations of oxamide: use of CNDO/force method. A.Annamalai, S.Singh (Dept. of Chem., Indian Inst. of Technol., Madras, India).

Indian J. Chem. A, vol.21A, no.10, p.949-52 (Oct. 1982). [received: April 1983] The theoretical force field for in-plane vibrations of oxamide has been evaluated using CNDO/force calculations. The initial force field is set up by taking the interaction and bending force constants of the CNDO/force field, and transferring the stretching force constants from force fields of chemically

related molecules. The experimental force field is then obtained by least squares refinement method considering the vibrational frequencies of $\text{H}_2\text{NCOCONH}_2$ and $\text{D}_2\text{NCOCOND}_2$. The band assignments are proposed on the basis of potential energy distributions. (16 refs.)

75312 Ab initio MRD-CI study of the electronic spectrum of SiH. M.Lewerenz, P.J.Bruna, S.D.Peyerimhoff (Lehrstuhl für Theoretische Chem., Univ. Bonn, Bonn, Germany), R.J.Buenker. *Mol. Phys. (GB)*, vol.49, no.1, p.1-24 (May 1983). Potential curves and other properties of the ground and excited states of SiH are calculated at close to full CI accuracy in DZP AO basis sets including f functions. The C^{2+} state of this system is shown to correspond to a second potential minimum of the $B^2\Sigma^+$ species which occurs because of an avoided crossing with a dissociative state of the same symmetry. The $D^2\Delta$ and $E^2\Sigma^+$ states are assigned as members of Rydberg series involving upper orbitals of $d\sigma$ and $d\pi$ symmetry respectively. In addition, a number of quartet states have been computed including the $^4\Pi$ and two $^4\Sigma^-$ species which have apparently not yet been characterized experimentally. The $^4\Pi$ state is found to be strongly repulsive, causing predissociation of the $4s$ and $4p$ members of the lowest Rydberg series; this observation is consistent with the fact that transitions to such upper states have yet to be observed experimentally. Computed spectroscopic constants, dipole and transition moments and dissociation energies are all found to agree quite well with experiment wherever comparison is possible, including results for spin-orbit constants as a function of vibrational level in the $X^2\Pi$ ground state. Comparison is also made with results for the isovalent systems PH^+ , CH and NH^+ at various levels and it is noted that NH^+ exhibits a number of unusual features because of the relatively high value of the nitrogen atom IP. (42 refs.)

75313 Virial partitioning analysis of electron correlation and nuclear motion in diatomic molecules. M.E.Stephens, P.J.Becker (Univ. Pierre et Marie Curie, Paris, France). *Mol. Phys. (GB)*, vol.49, no.1, p.65-89 (May 1983). Studies the influence of correlation and thermal motion on the electron distribution in several diatomic molecules. The influence of electron correlation is shown to be of the order of 10 per cent of the deformation density function and it tends to reduce the redistribution features due to bond formation. Vibrations are shown to play an important role in the thermally averaged charge density function but the influence of the deformation density is fairly small in the examples that are discussed (BeH and CO). The effect of anharmonicity can be quite significant. Further similar studies are needed in order to understand better the detailed balance in electron redistribution in molecules and solids, especially when interpreting experimental data from accurate diffraction experiments. (45 refs.)

75314 Energy levels of atomic nitrogen calculated in a multiconfiguration optimized potential model. K.Aashamar (Inst. of Phys., Univ. of Oslo, Oslo, Norway), T.M.Luke, J.D.Talman. *Phys. Scr. (Sweden)*, vol.27, no.4, p.267-74 (April 1983). The method of carrying out configuration interaction calculations using orbitals that are derived from variationally optimized potential [K. Aashamar, T.M. Luke, J.D. Talman, *J. Phys. B: Atom. Molec. Phys.* 12, p.3455 (1979), and vol.14, p.803 (1981)] is studied by applying it to the ground state and a considerable number of excited states of the nitrogen atom. The results of applying the method, using several correlation configurations, to the ground state multiplet are only slightly less satisfactory than the corresponding multiconfiguration Hartree-Fock results. It is shown furthermore that it is possible to obtain a unified description of a larger number of excited states within the model using quite restricted configuration sets which are chosen in a reasonable way. Wavelengths and oscillator strengths for a large number of transitions are calculated and compared with experiment. (21 refs.)

31.30 CORRECTIONS TO ELECTRONIC STRUCTURE

75315 Exact relation between the spectrum and the eigenfunctions of a generalized Jahn-Teller hamiltonian for different parameter values. H.G.Reik, F.Kaspar (Fakultät für Phys., Univ. Freiburg, Freiburg, Germany). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.253-5 (20 May 1983). A generalized $E \otimes e$ Jahn-Teller hamiltonian with a parameter δ ($\delta = -1/4$ in the JT case) is studied. As in the Jahn-Teller case, the angular momentum is a constant of the motion with the eigenvalues $j+1/2$ where j is a non-negative integer. For j fixed, consider two values $\delta_1 = -j/2-1/2$ and $\delta_2 = -\delta_1-1/2$. The spectrum and the eigenfunctions for δ_2 are completely determined by the spectrum and the eigenfunctions for δ_1 . (12 refs.)

75316 On the momentum representation of the relativistic Hartree-Fock-Roothaan wavefunctions. T.Mukoyama (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan), T.Kagawa. *J. Phys. B (GB)*, vol.16, no.11, p.1875-80 (14 June 1983). Analytical expressions for the momentum representation of the relativistic Hartree-Fock-Roothaan wavefunctions are obtained by means of the Fourier-Bessel transformation. The momentum distributions are calculated by the use of these expressions and the results are compared with the corresponding distributions of the nonrelativistic and relativistic hydrogenic wavefunctions as well as the nonrelativistic Hartree-Fock-Roothaan wavefunctions. (14 refs.)

75317 Note on the spin-orbit radial integrals. A.J.Savukynas (Inst. of Phys., Acad. of Sci., Vilnius, Lithuanian SSR). *J. Phys. B (GB)*, vol.16, no.11, p.2063 (14 June 1983). In a recently published paper (Godefroid, 1982) the relations between the radial integrals of the mutual electronic spin-orbit interaction are derived. These and the other required relations were presented in the author's book (Jucys and Savukynas 1973) and in the references cited therein. These relations are also given there for the spin-spin and orbit-orbit interactions. (2 refs.)

75318 Vacuum polarization for an electron in a strong Coulomb field. A.R.Neghabian (Inst. für Theoretische Phys., Ruhr-Univ. Bochum, Bochum, Germany). *Phys. Rev. A (USA)*, vol.27, no.5, p.2311-20 (May 1983). The electronic energy shifts due to the vacuum polarization are calculated to all orders $\alpha(Z\alpha)^n$, $n \geq 1$, and $100 \leq Z \leq 174$. The calculations are carried through in momentum space and the results are generally in good agreement with coordinate-space results. The momentum-space method is discussed in detail. (17 refs.)

75319 Relativistic calculations of core-polarization effects on the hyperfine structure in the alkalis. J.-L.Heully, A.M.Martensson-Pendrill (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden). *Phys. Scr. (Sweden)*, vol.27, no.4, p.291-6 (April 1983). A method for relativistic calculations of the hyperfine structure in the alkalis including core-polarisation effects is presented. The infinite summations over excited states is performed by using the inhomogeneous differential equation technique. By solving the equations recursively, the core-polarisation effects can be included to all orders. The relation of this method to the unrestricted Dirac-Fock approach and to the method used by Das and co-workers is discussed and numerical results are presented for the ground states of the alkalis from Na to Fr. (25 refs.)

75320 Calculation of the diamagnetic shielding of the nuclei by the point-charge approximation. Z.B.Maksic, K.Rupnik (Theoretical Chem. Group, 'Rudjer Boskovic' Inst., Zagreb, Yugoslavia). *Theor. Chim. Acta (Germany)*, vol.62, no.4, p.397-401 (1983). It is shown that the diamagnetic shielding of the nuclei can be calculated to a good accuracy by using point-charge approximation. Very good results were obtained by the semiempirical SCC-MO method employing Clementi-Raimondi AO basis set. (16 refs.)

31.50 EXCITED STATES

75321 Lifetime, triplet-triplet absorption spectrum and relaxation energy of an acyclic conjugated triene triplet: a pulse radiolysis study. A.A.Gorman, I.Hamblett (Chem. Dept., Univ. of Manchester, Manchester, England). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.4-5, p.42-6 (27 May 1983). The triplet state of neo-allocimene ($\tau = 333$ ns; $\lambda_{\text{max}} = 315$ nm) has been produced in toluene by pulse radiolysis. The establishment of a transient stationary position for reversible triplet energy transfer between this triene and anthracene has placed the equilibrium energy of the triene triplet at 169 ± 2 kJ mol $^{-1}$, 28 ± 2 kJ mol $^{-1}$ less than that of the Franck-Condon state. (23 refs.)

75322 On Rydberg series of autoionising resonances. J.P.Connerade (Blackett Lab., Imperial Coll., London, England). *J. Phys. B (GB)*, vol.16, no.11, p.L329-35 (14 June 1983). A recent formula due to Dubau and Seaton (1983) for the parametrisation of a Rydberg series of autoionising resonances is discussed and related to expressions given by other authors. A simple method of finding the four parameters is described and illustrated by an application to the autoionising spectrum of Xe I. (13 refs.)

75323 Variation of fine structure along atomic Rydberg series. L.R.Pendrill (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden). *Phys. Scr. (Sweden)*, vol.27, no.5, p.371-3 (May 1983). Recent improvements in the accuracy of measurement of optical light wavelengths have enabled absolute atomic energy levels to be determined over long Rydberg series with comparable precision to that of the direct fine structure measurements of the series. An expression describing the variation of the fine structure along a Rydberg series in terms of Rydberg-Ritz parameters is derived and a check of consistency with experimental data is performed. (19 refs.)

75324 On avoided crossing between molecular excited states; photochemical implications. V.Bonacic-Koutecky (Inst. für Phys. Chem., Freie Univ. Berlin, Berlin, Germany). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.213-20 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982). The consequences of geometrical relaxation in butadiene and in unprotonated Schiff base-allylideneimine (torsion around $\text{C}=\text{C}$, $\text{C}=\text{N}$ and $\text{C}-\text{C}$ bonds) for low lying singlet and triplet states have been investigated employing large scale CI treatments. The analysis of the correlated wavefunctions in terms of the VB-like ionic and covalent structures has been carried out. The importance of zwitterionic highly polar states of dienes as well as of the low lying covalent excited state has been discussed. Photochemical implications of different minima on the energy surfaces of excited states with contrasting features of the wavefunctions have been proposed. (37 refs.)

75325 Charge transfer transition for symmetry-forbidden charge transfer interaction. Theory and experimental verification. I.Murata (Dept. of Chem., Faculty of Sci., Osaka Univ., Osaka, Japan). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.323-30 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982). The group theoretical analysis of the electronic structure of 1,4-dihydro-1,4-bis (dicyanomethylene) triptycene leads to an interesting but rarely documented notion, 'charge transfer transition for symmetry forbidden charge transfer interactions', which was supported by the substituent effects on the charge transfer band shifts. The substituent effects on the charge transfer band shifts were also observed in a series of 9,10-dihydro-9,10-o-benzoanthracene-1,4-diones. These results provide decisive evidence for the fact that the orbitals involved in the ground state charge transfer interaction need not be the same as those involved in the charge transfer transition. (see also 34. Atomic and molecular collisions)

- 75327 Time-resolved study of the subpicosecond dynamics of molecular rotations in liquids. J.M. Halbout, C.L. Tang (Cornell Univ., Ithaca, NY, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.135-40 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982). Time resolved results on the relaxation of molecular rotations in liquids are reported. In CS_2 , in addition to the 2 picosecond Debye relaxation time, a 330-femtosecond short relaxation time is observed for the first time. This short relaxation time is interpreted as due to the relaxation of the molecules within the librational wells in the liquid. A similar short relaxation time on the order of 150 femtoseconds is also observed in neat liquid nitrobenzene. (11 refs.)

31.90 OTHER TOPICS IN THE THEORY OF ATOMS AND MOLECULES

(inc. properties other than energy)

- 75328 The physical significance of multiple refinement minima in harmonic force field calculations. M. Lacy (Dept. of Phys. Chem., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England). *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.1-9 (June 1983). The technique of comparing potential energy surfaces, introduced previously to study anharmonic force fields, is applied to the examination of multiple refinement minima in harmonic force field calculations. Although the varia-

tion of the potential surface caused by different data and weighting schemes is substantially larger than in the anharmonic case, the multiple refinement minima examined represent surfaces which are significantly different from each other. The approach is suggested as a first useful step in the appreciation of the physical significance of this and other features in molecular potential energy surfaces. (18 refs.)

- 75329 Topological properties of conformational potential energy surfaces. M.R. Peterson, I.G. Csizmadia (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada), R.W. Sharpe. *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.127-35 (June 1983). Topological relations among the number of critical points of various orders (zero order are minima, first order are saddle points, etc.) are presented, which are invariants of the actual periodic (hyper)surfaces considered. The principal results involve the Betti numbers, the minimum number of critical points of given order that must be present, and the Euler characteristic, based on an alternating sum rule involving the number of critical points of each order. Several conformational potential energy (hyper)surfaces are analyzed in terms of these relationships, including two containing lines of degeneracy and degenerate critical points. (19 refs.)
- 75330 Theoretical study of the lithium dimer and its anion. H. Partridge (Univ. of Southern California, University Park, Los Angeles, CA, USA), C.W. Bauschlicher, Jr., P.E.M. Siegbahn. *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.198-203 (13 May 1983). Theoretical potential energy curves are reported for the $X^1\Sigma_g^+$ state of Li_2 and the $X^2\Sigma_u^+$ state of Li_2^- . The electron affinity of Li_2 is estimated to be 0.43 ± 0.02 eV. In addition, the authors show that for Li_2 and Li_2^- core correlation effects are small but shorten R_e of Li_2 by $0.04 a_0$ and slightly skew the potential curves. (21 refs.)
- 75331 Dissociation energy of aluminium monoselenide molecule. P. Sambasiva Rao (Dept. of Phys., J.N. Technol. Univ., Coll. of Engng., Anantapur, India), R. Ramakrishna Reddy, T.V. Ramakrishna Rao. *Indian J. Phys. Part B*, vol.56B, no.6, p.353-7 (Dec. 1982). [received: May 1983] The experimental potential energy curves for $X^2\Sigma^+$ and $A^2\Sigma^+$ states of $AlSe$ have been constructed using the method of Lakshman and Rao (1971). The dissociation energy for the ground state has been estimated to be 2.23 ± 0.08 eV, using the curve fitting procedure. (14 refs.)

32.20 ATOMIC SPECTRA GROUPED BY WAVELENGTH RANGES

- 75332 Laser spectroscopy of Rydberg states of two-electron atoms. W. Hogervorst (Vrije Univ., Amsterdam, Holland). *Comments At. & Mol. Phys. (GB)*, vol.13, no.2, p.69-81 (1983). Recent progress in the study of the structure of Rydberg levels in two-electron atoms with narrow-band CW dye lasers is reviewed. New and accurate data have resulted in an assessment of the importance of two-body effects and in a critical test of multichannel quantum defect analyses. (38 refs.)
- 75333 Quantum defects of the $n^2P_{1/2,3/2}$ levels in ^{39}K and ^{85}Rb . C.-J. Lorenzen, K. Niemann (Inst. für Experimentalphys., Univ. Kiel, Kiel, Germany). *Phys. Scr. (Sweden)*, vol.27, no.4, p.300-5 (April 1983). The energies of the $n^2P_{1/2,3/2}$ level series in ^{39}K ($9 \leq n \leq 21$) and ^{85}Rb ($13 \leq n \leq 68$) have been measured using frequency-doubled CW dye laser radiation, a thermionic detector and a high-precision vacuum-wavemeter. By means of a Rydberg-Ritz fitting procedure accurate quantum defect data and ionization limits are given. The ionization limits are in agreement with the limits derived from energy data of other l -series which have been measured recently with laser spectroscopy techniques. The compact Rydberg-Ritz coefficient of all alkali term series with $l \leq 3$ is presented and the present status of alkali quantum defect data is discussed. This set of data includes also recent measurements of ^{133}Cs $n^2S_{1/2}$ and $n^2D_{3/2,5/2}$ levels and of some low-lying 7Li levels. (22 refs.)

- 75334 Nonlinear resonances which arise during the interaction of atoms with spaced powerful standing waves. B.Ya. Dubetskii (Inst. of Thermal Phys., Acad. of Sci., USSR). *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.5, p.155-60 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.990-6 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981). In 1974 the author began theoretical and then also experimental investigations of the possibilities of narrowing optical lines by means of the method of spaced fields (MSF) on the initiative of F.P. Chebotayev. In optics the use of the MSF is made difficult due to the large Doppler broadening of the line. The author advanced methods for eliminating the influence of the Doppler effect and for obtaining narrow lines on one-photon transitions for two-photon absorption in stimulated-Raman-scattering (SRS) spectroscopy. The results of the theory of the MSF are given. (32 refs.)

75335 Photoionization Raman spectroscopy. I.M.Beterov, N.V.Fateev, V.P.Chebotaev (Inst. of Thermal Phys., Acad. of Sci., USSR).

JETP Lett. (USA), vol.36, no.7, p.307-10 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.251-3 (5 Oct. 1982). [received: May 1983]

Experiments are reported on the photoionization detection of stimulated Raman scattering by electronic transitions of sodium in an atomic beam. There is a dip in the signal corresponding to the nonresonant two-photon ionization of sodium by electromagnetic radiation at $\lambda_1=284.5$ nm and $\lambda_2=1.06$ μ m. The dip is due to a Raman resonance at the forbidden 3s-4s transition. (8 refs.)

75336 FO_2 radical and LMR spectra in reactions of fluorine atoms. P.B.Davies, F.Temps, H.G.Wagner, D.P.Stern.

Report 19/1982, Max-Planck-Inst. Stromungsforschung, Gottingen, Germany (Dec. 1982), 19 pp.

Far Infrared Laser Magnetic Resonance spectra of the FO_2 radical have been detected at eleven laser frequencies. The assignment is based on chemical and kinetic results and on a qualitative spectroscopic investigation. It is suggested that this radical may be responsible for many unassigned 5 and 10 μ m Laser Magnetic Resonance spectra. (26 refs.)

75337 Identification of the $4d^{10}5p^61S_0$ level in Xe III using optical spectroscopy. J.E.Hansen, F.G.Meijer (Zeeman Lab., Univ. of Amsterdam, Amsterdam, Netherlands), M.Outerd, W.Persson, H.O.Di Rocco.

Phys. Scr. (Sweden), vol.27, no.4, p.254-5 (April 1983).

Two different proposals for the identification of the $4d^{10}5p^61S_0$ level in Xe III are examined using the methods of optical spectroscopy. The proposal by Hertz [*Z. Phys.*, vol.A274, p.289, (1975)] is confirmed. The $5p^61S_0$ level is located 210 857.55 cm^{-1} above the Xe III ground state. (16 refs.)

75338 Spectra of the ironlike ions from YXIV to Ag XXII. J.-F.Wyart (Lab. Aime Cotton, CNRS II, Orsay, France), M.Klapisch, J.-L.Schwob, N.Schweitzer, P.Mandelbaum.

Phys. Scr. (Sweden), vol.27, no.4, p.275-90 (April 1983).

The spectra of the ironlike ions Y XIV, Zr XV, Nb XVI, Mo XVII, Ru XIX, Rh XX, Pd XXI and Ag XXII emitted by low inductance vacuum sparks have been observed in the range 25-90 Å. More than 440 lines have been identified for the first time as $3p^63d^8-3p^53d^9$ and $3p^63d^8-3p^63d^44p$ transitions. Three parametric interpretations of the whole isoelectronic sequence of energy levels have been performed for $3d^8$, $3p^63d^8$ and $3d^44p$ respectively. This has led to an accurate determination of scaling factors for the Slater and spin-orbit integrals calculated by the Hartree-Fock method. Predicted wavelengths and line strengths are given for Sr XIII. (17 refs.)

75339 The spectrum of singly ionized phosphorus, P II. N.Svendenius, C.E.Magnusson, P.O.Zetterberg (Phys. Dept., Lund Univ., Lund, Sweden).

Phys. Scr. (Sweden), vol.27, no.5, p.339-63 (May 1983).

New observations in the P II spectrum have been made in the wavelength region 500-12000 Å. The spectrum was excited in two different ways, using a high-frequency lamp and a sliding spark in vacuum. The term system now includes 159 levels and about 900 identified lines, which means a doubling of the number of levels and identified transitions. The energy of the lowest limit, $3s^23p^2P$, is derived from *ng*-series, which are all new. A linear Ritz formula gives the value 160010.6 cm^{-1} for the $2^3P_{3/2}$ component of the limit, and the ground term splitting 559.14 cm^{-1} in P III then gives 159451.5 cm^{-1} for the $2^1P_{1/2}$ limit level. (10 refs.)

75340 The configurations $3s^23p^53d$ and $3s3p^63d$ in Mn VIII and Fe IX. R.Smít, L.A.Svensson (Dept. of Phys., Univ. of Lund, Lund, Sweden).

Phys. Scr. (Sweden), vol.27, no.5, p.364-6 (May 1983).

The astrophysically important configuration $3s^23p^53d$ has been determined for Mn VIII and Fe IX by means of about 60 lines, classified as combinations $3s^23p^6-3s^23p^53d$ and $3s^23p^63d-3s3p^63d$. The authors also introduce a sensitive method for isoelectronic comparison of energy parameters. By this method the configuration $3s^23p^53d$ is studied through the Ar I sequence, thus supporting the reported Mn VIII and Fe IX identifications. (9 refs.)

32.50 FLUORESCENCE, PHOSPHORESCENCE

(inc. quenching)

75341 Time-resolved two-dimensional imaging of ground-state species using laser-induced fluorescence. R.A.Dougal, P.F.Williams, D.C.Pease (Dept. of Electrical Engng., Texas Tech. Univ., Lubbock, TX, USA).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.572-3 (May 1983).

Laser-induced fluorescence has been employed to obtain two-dimensional images of the spatial distribution of a vapor in the ground state with nanosecond resolution. The method has a wide range of potential applications, as it can be used to observe any species which has energy levels accessible to tunable laser systems. In the application described, aluminum vapor was observed jetting from spark gap electrodes and diffusing throughout the gap volume. (2 refs.)

32.60 ZEEMAN AND STARK EFFECTS

75342 Comment on 'Plasma satellites in the presence of nonresonant, coherent and polarised radiation'. N.J.Wiegart, U.Rebhan (Inst. für Experimentalphys. V, Ruhr-Universität, Bochum, Germany).

J. Phys. B (GB), vol.16, no.11, p.L367-8 (14 June 1983).

A recently published calculation by Drawin and Truong-Bach (ibid., vol.15, p.4477, 1982) concerning the high-frequency Stark effect is shown to be in error. 'Negative intensities' of satellite lines result from an incorrect mathematical treatment of the problem. (5 refs.)

75343 Exact solution of the Dirac-Coulomb equation and its application to bound-state problems. I. External fields. M.K.F.Wong (Dept. of Math., Fairfield Univ., Fairfield, CT, USA), Hsin-Yang Yeh.

Phys. Rev. A (USA), vol.27, no.5, p.2300-4 (May 1983).

An exact treatment of relativistic effects in bound-state problems in hydrogen-like atoms is given. In this paper the authors discuss the Zeeman effect and the Stark effect for relativistically bound electrons in a Coulomb field. For the Zeeman effect, the exact solution obtained by Darwin (1928) is used, and results of Crubellier and Feneuille (1971) for the Breit-Margenau correction are obtained in a simple way. For the Stark effect, the solution of Wong and Yeh (1982) is used. The exact expression can be readily compared with that of the Pauli approximation, and all correction terms can be identified. In the following paper they discuss interaction of the bound electron with radiation in an exact relativistic way. In the evaluation of the radial r^k matrix elements with $n' \neq n$, the authors present a closed-form expression as a sum over three parameters, derived from the method of the generating function of Laguerre polynomials. (14 refs.)

32.70 SPECTRAL LINE SHAPES AND INTENSITIES

75344 Minima and maxima in the generalized oscillator strengths for the lithium isoelectronic sequence. S.N.Tiwary, C.A.Nicolaides (Inst. of Theoretical & Phys. Chem., Nat. Hellenic Res. Foundation, Athens, Greece).

Chem. Phys. Lett. (Netherlands), vol.97, no.3, p.283-4 (20 May 1983).

The authors have calculated the ionization generalized oscillator strengths (GOS) $f(K,k)$ as a function of the momentum transfer K for the followed dipole transitions $ns-kp$ (with $n=2$) in the lithium isoelectronic sequence through $Z=10$, in the Hartree-Fock (HF) approximation. The results clearly show (i) the regular and systematic trends of the occurrence of the extrema, (ii) the shift of their positions towards the higher values of K with increase of K , and finally; the gradual decrease of the magnitude of $f(K,k)$ with increase of atomic number Z . The results are discussed qualitatively. (7 refs.)

75345 Determination of the oscillator strengths of the $6D-6^1P_1$ atomic energy mercury transitions. P.van de Weijer, R.M.Cremers (Philips Res. Labs., Eindhoven, Netherlands).

J. Appl. Phys. (USA), vol.54, no.5, p.2835-6 (May 1983).

The magnitude of the oscillator strengths (f values) of the $6D-6^1P_1$ transitions of atomic mercury is of interest, e.g. for the determination of the 6^1P_1 mercury density in gas discharges by optical methods. However, contradictory results for these f values have been reported in the literature. Using the accurately known radiative lifetime of the 7^3S_1 level as a starting point, the authors performed combined emission and hook measurements. As a result they found $f=0.28 \pm 0.04$ and $f=0.25 \pm 0.05$ for the 577.0 nm ($6^3D_2-6^1P_1$) and 579.1 nm ($6^1D_2-6^1P_1$) line, respectively. (11 refs.)

75346 Collisional broadening of intra-Doppler resonances of selective reflection on the D_2 line of cesium. A.M.Akul'shin, V.L.Velichanski, A.S.Zibrov, V.V.Nikitin, V.V.Sautenkov, E.K.Yurkin, N.V.Senkov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.7, p.303-7 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.247-50 (5 Oct. 1982).

[received: May 1983]

The broadening of selective reflection resonances for cesium atom concentrations N such that collisional resonance broadening γ_c is less than the Doppler broadening is investigated. A method is proposed for measuring γ_c at the center of the atomic line. It is found that the N -dependence of the reflection resonance width for the D_2 line is $\gamma_c=(1.15 \pm 1.12) \times 10^{11} N$ Hz. (10 refs.)

75347 Lifetimes of the Ne 2p fine structure states by measurements of linewidths of the laser induced fluorescence of an atomic beam. M.J.Verheijen, H.C.W.Beijerinck, P.J.Eenshuistra, J.P.C.Kroon, N.F.Verster (Dept. of Phys., Eindhoven Univ. of Technol., Eindhoven, Netherlands).

Opt. Commun. (Netherlands), vol.45, no.5, p.336-41 (1 May 1983).

The laser induced fluorescence signal of a crossed atomic beam-photon beam is used to measure the natural lifetimes of six of the 2p fine structure states of Ne I. The excitation profiles are analysed with a model function consisting of an unbroadened Lorentzian lineshape with the full-width at half-maximum $\Delta\nu$ (natural lineshape) as a free parameter, which is then fully convoluted with the experimental conditions as Doppler effect, Zeeman splitting and saturation. The broadening due to these effects is typically 3 MHz. To avoid strong correlations of the value of $\Delta\nu$ with an incorrect shape of the model function, the authors only use the datapoints that are most sensitive to $\Delta\nu$, i.e. at the maximum and at half height. The resulting lifetimes lie all within the 1σ error bound (5%) from other experimental results. The results add an independent set of data to these well investigated lifetimes. (12 refs.)

75348 General dressed Hamiltonian for a composite particle in a medium. R.Fleckinger, Y.Soulet (Lab. de Phys. Quantique, Univ. Paul Sabatier, Toulouse, France).

Physica A (Netherlands), vol.119A, no.1-2, p.243-73 (April 1983).

The general dressed hamiltonian for a composite particle in a medium is obtained by using joined Fock-Tani representation for composite particles, causal Green's function method and Balescu's kinetic theory formulation. An explicit calculation of this dressed hamiltonian is presented within the frame of the medium-composite weak coupling approximation and tested on the hydrogen Ly_α -line broadening. (11 refs.)

75349 Doppler-free laser spectroscopy measurements on a Ne discharge for determination of ^{22}Ne , ^{20}Ne isotope shifts. C.Bellfrage, P.Grafstrom, S.Kroll, S.Svanberg (Dept. of Phys., Lund Inst. of Technol., Lund, Sweden). *Phys. Scr. (Sweden)*, vol.27, no.5, p.367-70 (May 1983). The authors have used Doppler-free polarization spectroscopy, intermodulated fluorescence and intermodulated optogalvanic spectroscopy for measuring isotope shifts in 6 Ne lines connecting the $2p^3s$ and $2p^3p$ configurations. The measurements were performed on two different hollow cathodes. For the 5852, 5882, 5945, 5976, 6143 and 6164 Å lines the ^{22}Ne isotope shift was found to be 2300(15), 1740(2), 1717(3), 1728(5), 1669(4) and 1663(5) MHz, respectively. These results are in fair agreement with previous optical spectroscopy data. (25 refs.)

75350 Broadening of level-crossing signals in the $5^2P_{3/2}$ state of rubidium due to resonant collisions. M.Lukaszewski, I.Jackowska (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland). *Phys. Lett. A (Netherlands)*, vol.95A, no.8, p.429-31 (23 May 1983).

Broadening of three isolated level-crossing signals in the resonance $5^2P_{3/2}$ state of ^{87}Rb due to resonant Rb-Rb collisions is investigated experimentally. The results confirm the interpretation of the experiments on collisional broadening of level-crossing signals in excited $P_{3/2}$ states of heavy alkali-metal atoms presented in the authors' recent paper (ref. unobtainable). The present work provides also additional experimental evidence that the description of resonant collisional depolarization of the $5^2P_{3/2}$ state of rubidium by the R^{-3} dipole-dipole potential is very satisfactory. 75351 Photoionisation cross section calculations using Dyson amplitudes: results for Ne. I.Cacelli (Istituto di Chimica Fisica, Univ. di Pisa, Pisa, Italy), V.Carravetta, R.Moccia. *J. Phys. B (GB)*, vol.16, no.11, p.1895-906 (14 June 1983).

Photoionisation cross sections of the main ionisation process of neon have been calculated for a wide range of photon energies. The partial cross sections were computed as a sum of a contribution expressible in terms of the Dyson amplitude corresponding to the ionisation processes considered plus a correction term. The numerical results obtained, in satisfactory agreement with the experiment, show, as expected, that for outer-shell ionisation the correction term decreases rapidly with the photon energy. For inner-shell ionisation, however, the correction term appears to be still important at relevant (~ 100 eV) energies of the photoelectron. Results given by different choices of the photoelectron waves are also presented. (20 refs.)

75352 $K\alpha^h$ hypersatellite spectrum and K shell double photoionization cross-section for Ar. E.Mikkola, J.Ahopelto (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland). *Phys. Scr. (Sweden)*, vol.27, no.4, p.297-9 (April 1983).

The $K\alpha^h$ hypersatellite spectrum of gaseous Ar has been measured in photon excitation with a plane crystal Bragg spectrometer. The experimental energy of $K\alpha^h$ line is obtained. The result is in good agreement with available theoretical calculations. The K shell double photoionization cross-section is estimated from the measured hypersatellite intensity and it is compared with existing theoretical calculations based on the shake theory and correlated wave functions. (29 refs.)

Photoionization Raman spectroscopy See Entry 75335

32.80H Auger effect and inner-shell ionization

75353 An improved model for post-collision interaction (PCI) and high resolution Ar LMM Auger spectra revealing new PCI effects. K.Helenelund, S.Hedman, L.Asplund, U.Gelius, K.Siegbahn (Inst. of Phys., Univ. of Uppsala, Uppsala, Sweden). *Phys. Scr. (Sweden)*, vol.27, no.4, p.245-53 (April 1983).

An improved semi-classical model for post-collision interaction (PCI) in photo-excited Auger decay is presented. A simple analytical expression is obtained by using complex WKB wave functions for the slow electron. The model gives the right asymptotic line-shape at high excess energies and the energy shift of the peak maximum is in agreement with experimental results. New high resolution argon LMM Auger spectra excited by electrons at different excess energies (4.5-2751.0 eV) relative to the L_3 level in Ar are presented. Extra structures are observed at low excess energies and are tentatively interpreted to be caused by 'shake-down' processes of the slow electron. The relative shifts between Kr $M_5N_{23}N_{23}(^1S_0)$ and Ar $L_3M_{23}M_{23}(^1D_2)$ lines are measured and tabulated. The full widths and the asymmetry parameters at half and quarter maximum are also given. (68 refs.)

75354 Iterative methods for calculation of displacements of normal coordinates from observed vibrational intensities. F.T.Chau (Pentecostal School, Hong Kong, Hong Kong). *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.155-61 (June 1983).

Three one-dimensional search techniques, namely the dichotomous search (or symmetrical two-point search), the Fibonacci search and the golden-ratio search are used to calculate the value of γ (the displacement in normal coordinates of a particular vibrational mode in an electronic transition) which gives the best agreement between the observed and the calculated vibrational intensities. All the methods are found to be powerful and converge rapidly to the desired result. The golden-ratio search method is preferred because of its speed and simplicity in programming. (6 refs.)

75355 Electron relaxation during strong electron-vibration coupling. V.N.Kharkyanen. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.1, p.58-61 (1983). In Ukrainian.

A kinetic description of the evolution of an electronic system placed in a thermostat is constructed for the case of a strong electron-vibration coupling when the usual perturbation theory parameter is not small. Necessary kinetic equations and their applicability limits are found by double reduction of the initial Liouville equation for the whole system. (5 refs.)

75356 Force field for in-plane vibrations of trans-cis-diacetamide. Use of CNDO/Force method. A.Annamalai, Surjit Singh (Dept. of Chem., Indian Inst. of Technol., Madras, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.2, p.82-6 (Feb. 1983).

Using the CNDO/Force and the least squares refinement calculations, the redundancy-free internal valence force field is evaluated for the in-plane vibrations of trans-cis-diacetamide. The initial force field considered is based on the bending and interaction force constants obtained from the CNDO/Force calculations, and the stretching force constants transferred from chemically related molecules. The vibrational frequencies of $\text{CH}_3\text{CONHCOCH}_3$, $\text{CH}_3\text{CONDCOCH}_3$, $\text{CD}_3\text{CONHCOCD}_3$ and $\text{CD}_3\text{CONDCOCD}_3$ are employed in refining the force field. The refined force field obtained is found to be reasonable. (20 refs.)

75357 Force field study of some nonlinear XY₂ type molecules. S.Mohan, S.Gunasekaran, K.G.Ravikumar (Div. of Appl. Sci., Anna Univ., Madras Inst. of Technol., Madras, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.2, p.121-2 (Feb. 1983).

The most probable force fields of the nonlinear XY₂-type molecules like SO_2 , ClO_2 and CF_2 have been fixed by a parametric method. The centrifugal distortion constants are used as additional data to fix the potential constants unambiguously. (17 refs.)

75358 Halogen-substituted amides. V. Modified valence force field for N,N-dichloroacetamide. K.Sree Ramulu, E.Krishna Murthy, G.Ramana Rao (Dept. of Phys., Univ. Coll., Kakatiya Univ., Warangal, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.3, p.185-7 (March 1983).

For pt.IV see ibid., vol.20, no.10, p.787 (1982). A modified valence force field has been derived for N,N-dichloroacetamide from vibrational frequencies using a damped least-squares method. The nature of the normal vibrations has been investigated with the help of potential energy distributions. Arguments have been presented to revise the assignment of stretching mode of C-C to 1001 cm^{-1} . (10 refs.)

75359 Algebraic approach to molecular rotation-vibration spectra. F.Iachello (Wright Nuclear Structure Lab., Yale Univ., New Haven, CT, USA), R.D.Levine. *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1679-81 (April 1983).

A summary of the recent progress in the algebraic approach to molecular spectra and dynamics is presented, with references. Particular attention is given to rotating diatomic molecules where not only the Morse but other anharmonic potentials can be discussed. (18 refs.)

- 75360 Binding energies and spectroscopic constants of the first-row and second-row diatomic hydrides.** P.C.Jain, A.J.Kaur, P.S.Bakshi, J.Shanker (Dept. of Phys., Agra Coll., Agra, India). *Indian J. Chem. A*, vol.21A, no.10, p.945-8 (Oct. 1982). [received: April 1983]
The phenomenological method recently used by Pandey and Pandey [ibid., vol.20A, p.592 (1981)] for calculating rotational constant (α_e), vibrational constant ($\omega_e X_e$) and binding energy (D_0) of the first-row and second-row diatomic hydrides has been revised by considering improved potential functions for interatomic energies. The potential function which considers the inverse power dependence of the repulsive energy on inter-nuclear distance and a modified value of ionic charge, produces best agreement with experiment. An explanation for the modified ionic charge has been provided in terms of electronegativity difference for constituent atoms forming the bond. (11 refs.)
- 75361 Evaluation of molecular properties of diatomic alkali halides.** Raj K. Gupta, A.J.Kaur, P.S.Bakshi, J.Shanker (Dept. of Phys., Agra Coll., Agra, India). *Indian J. Phys. Part B*, vol.56B, no.6, p.344-52 (Dec. 1982). [received: May 1983]
Values of rotation-vibration coupling constant α_e , vibrational anharmonicity constant $\omega_e X_e$ and higher order molecular spectroscopic constants β_e and γ_e of diatomic alkali halides have been calculated using the Hellmann potential. It is shown that the results obtained in the present study are in much better agreement with the corresponding experimental data than those obtained recently by Hasan, Pathak and Thakur (1981). (11 refs.)

- 75364 Peculiarities of dip (hole) burning in the spectra of organic molecules in vitreous matrices.** A.A.Gorokhovskii, Ya.V.Kikas, V.V.Pal'm, L.A.Rebane (Phys. Inst., Acad. of Sci., Estonian SSR). *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.5, p.116-20 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.952-6 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981).
The authors determine the homogeneous widths of the spectral lines using the method of photochemical hole burning. The impurity molecule of H_2 -tetra-4-tertiary-butylphthalocyanine (H_2Pc) was introduced into matrices of three types: organic glass (a mixture of isopropyl alcohol and ether in the ratio 2:5 by volume), a polycrystal having a large inhomogeneous broadening (nonane) and a Shpol'skii matrix (tetradecane). The inhomogeneous band in nonane is similar to the band in glass (it has a maximum at 697 nm and a width of 150 cm^{-1}), which ensures comparable excitation conditions. The hole was burned by means of a scanned oxazine laser which was pumped synchronously by a pulsed krypton laser operating in a mode-locking regime. By varying the degree of locking one could obtain a smooth contour of the oxazine lasing line with a width of from 0.2 to 1 cm^{-1} . In order to obtain a spectrally narrow hole-burning, the line was additionally monochromatized by means of an RC-110 interferometer.
- 75365 Photophysics of aryl substituted 1,3,4-oxadiazoles: the triplet state of 2,5-diphenyl-1,3,4-oxadiazole.** C.Rulliere (Centre de Phys., Moleculaire Optique et Hertzienne, Univ. de Bordeaux I, Talence, France), P.C.Roberge. *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.247-52 (13 May 1983).
A theoretical approach using a SCF CI method has been used to analyse the T_1-T_0 absorption spectrum of 2,5-diphenyl-1,3,4-oxadiazole. In its first triplet state in a non-polar solvent, this molecule is strongly non-planar. The conclusion is corroborated by comparison of the fluorescence and phosphorescence spectra. A change of geometry, towards a more planar conformation, appears to occur in an alcoholic solution. It is suggested that $n\pi$ autocomplexes are formed in the triplet state. Conflicting results published for the T-T absorption must be attributed to an impurity. (19 refs.)
- 75366 The hypersensitive $\Delta_g(\sigma_u\delta_u)-\Sigma_g$ transition of the uranyl ion.** C.D.Flint (Dept. of Chem., Birkbeck Coll., London, England). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.317-18 (20 May 1983).
The $\Delta_g(\sigma_u\delta_u)-\Sigma_g(\sigma_u)^2$ transition of the uranyl ion which corresponds to an electron transfer for a weakly bonding oxygen orbital to a non-bonding uranium $5f_{z^2}$ orbital has characteristics similar to the so-called hypersensitive 4f-4f transitions of the lanthanide ions. (18 refs.)
- 75367 Some notes on exciplex emission from aromatic hydrocarbon-aromatic triarylamines.** A.K.Purkayastha, S.Basu (Dept. of Chem., Univ. Coll. of Sci., Calcutta, India). *Indian J. Phys. Part B*, vol.56B, no.6, p.375-8 (Dec. 1982). [received: May 1983]
Shows that if the one electron-one orbital energy level scheme for exciplex emission from aromatic hydrocarbon-aromatic triamine as proposed by Basu (1979) is accepted, then it is to be concluded that the hydrocarbon excited states involved are of α -parentage. (8 refs.)

- 75368 Microwave spectrum, dipole moment and ab initio molecular structure of 2-aminopropenitrile ($\text{CH}_2=\text{C}(\text{NH}_2)\text{CN}$).** A.Bauder, T.-K.Ha (Lab. fur Phys. Chem., Eidgenossische Tech. Hochschule, Zurich, Switzerland). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.135-40 (13 May 1983).
The microwave spectrum of 2-aminopropenitrile has been investigated from 18 to 58 GHz. More than 70 rotational transitions have been assigned for the ground and one excited vibrational state. Rotational constants and centrifugal distortion constants were determined for these states. The electric dipole components $\mu_a=3.76(2)$, $\mu_b=0.71(9)$ and $\mu_{\text{total}}=3.83(8)\text{ D}$ were deduced from Stark splittings. The molecular structures of the almost planar stable conformer and a $90^\circ\text{ C}=\text{C}$ twisted conformer were optimized by ab initio calculations. Additional information was obtained on the lower excited electronic states. (12 refs.)
- 75369 The microwave spectrum of the SiN ($^2\Sigma^+$) radical.** S.Saito, Y.Endo, E.Hirota (Inst. for Molecular Sci., Ozakazi, Japan). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6447-50 (1 June 1983).
The microwave absorption spectrum of the SiN radical has been detected in a DC glow discharge in a SiCl_4 or SiH_4/N_2 mixture. The three rotational transitions $N=2-1$, $3-2$, and $4-3$, have been observed in the frequency region 87 to 175 GHz by using a source-frequency modulation microwave spectrometer. The rotational constant, the centrifugal distortion constant, the spin-rotation coupling constant, and the magnetic hyperfine coupling constants b and c and the electric quadrupole coupling constant of the nitrogen nucleus have been precisely determined. The electronic structure of the SiN molecule has been briefly discussed using the magnetic hyperfine constants and also the quadrupole coupling constant $[3.05(23)\text{ MHz}]$ of ^{14}N . (18 refs.)

33.20E Infrared spectra

75370 Infrared heterodyne spectroscopy of seven gases in the vicinity of chlorine monoxide lines. H.A. Weaver, M.J. Mumma, J.L. Faris, T. Kostiuik, J.J. Hillman (Infrared & Radio Astron. Branch, NASA Goddard Space Flight Center, Greenbelt, MD, USA).

Appl. Opt. (USA), vol.22, no.10, p.1562-7 (15 May 1983).

Chlorine monoxide (ClO) is thought to play an important role in a photochemical cycle which causes the destruction of ozone in the Earth's stratosphere. Since lines of the (1,0) fundamental of ClO lie near $^{14}\text{C}^{16}\text{O}_2$ laser lines, IR heterodyne spectroscopy is potentially an important technique for monitoring the ClO abundance. However, due to the presence of lines from other trace atmospheric gases in this spectral range, the interpretation of such observations is ambiguous unless high-resolution laboratory measurements support the identifications. The authors report here measured frequencies for spectral lines of seven trace atmospheric gases which absorb near the $^{14}\text{C}^{16}\text{O}_2$ laser transitions relevant to the detection of ClO by IR heterodyne spectroscopy. (18 refs.)

75371 The microwave and far-infrared spectra of the CH radical. J.M. Brown (Dept. of Chem., Southampton Univ., Southampton, England), K.M. Evenson.

Astrophys. J. Lett. Ed. (USA), vol.268, no.1, pt.2, p.L51-6 (1 May 1983).

The frequencies, wavelengths, and line strengths for transitions of the CH molecule at microwave and far-infrared wavelengths have been calculated from an analysis of the laser magnetic resonance spectrum. The low-frequency transitions are between lambda-doublet type doublets, while the higher frequency transitions are between different spin-rotation levels. (17 refs.)

75372 IR dimer spectroscopy and Fermi resonance. J. Geraedts, S. Stolte, J. Reuss (Fysisch Lab., Katholieke Univ., Nijmegen, Nijmegen, Netherlands).

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.152-4 (13 May 1983).

A careful discussion of Fermi resonances is shown to explain qualitatively the many observed line shifts from molecular-beam infrared predissociation experiments. (14 refs.)

75373 Matrix spectroscopy in the gas phase: IR spectroscopy of argon clusters containing SF_6 or CH_3F . T.E. Gough, D.G. Knight, G. Scoles (Chem. Dept., Univ. of Waterloo, Waterloo, Ontario, Canada).

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.155-60 (13 May 1983).

Optothermal (bolometric) detection and a line-tunable CO_2 laser have been used, in conjunction with supersonic beams of dilute mixtures of SF_6 or CH_3F in Ar, to obtain the infrared spectra of Ar clusters containing these molecules. The spectra obtained at the limit of large clusters are remarkably similar to the infrared Ar matrix deposition spectra of the same molecules. (24 refs.)

75374 Selective dynamical coupling in the d-d spectra of octahedral d^3 complexes. A. Ceulemans (Dept. of Chem., Univ. of Leuven, Leuven, Belgium).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.365-8 (27 May 1983).

The odd-parity vibrational modes which induce intensity in the $^4A_{2g} \rightarrow ^2E_g$ electronic d-d transition in octahedral d^3 complexes, are subdivided from octupolar parent modes, whereas the infrared spectrum is clearly dominated by dipolar terms. These complementary selection rules reflect the hexadecapolar character of the first $t_{2g} \rightarrow e_g$ orbital transition. (25 refs.)

75375 Vibrational spectra of phosphotungstate ion- $\text{PW}_{12}\text{O}_{40}^{3-}$. S.S. Saleem, G. Aruldas (Dept. of Phys., Univ. of Kerala, Kariavattom, India).

Indian J. Pure & Appl. Phys., vol.21, no.2, p.112-15 (Feb. 1983).

The infrared and Raman spectra of phosphotungstic acid have been recorded. The factor group analysis has been carried out using the site group approach for the phosphotungstate ion $\text{PW}_{12}\text{O}_{40}^{3-}$ of T_d symmetry. Based on group vibrations and factor group analysis a vibrational assignment has been proposed for the $\text{PW}_{12}\text{O}_{40}^{3-}$ ion. (23 refs.)

75376 Vibrational spectra of 2,5- and 2,6-dimethylanilines. S.K. Singh, R.N. Singh (Dept. of Phys. LS Coll., Bihar Univ., Muzaffarpur, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.163-7 (March 1983).

The far infrared (200-500 cm^{-1}), infrared (200-4000 cm^{-1}) and laser Raman (100-3500 cm^{-1}) spectra of 2,5- and 2,6-dimethylanilines have been recorded using a Fourier far IR spectrometer, a Perkin Elmer grating spectrophotometer and a He-Ne laser Raman spectrometer respectively. The vibrational spectra have been analyzed assuming C_s and C_{2v} point groups respectively for these two compounds. The assignments for the fundamental vibrations, combination and overtone frequencies and the internal modes of vibrations of methyl groups as well as amino groups have been proposed. The vibration number in Wilson's notations for each mode of fundamental vibration has been indicated. (21 refs.)

75377 Spectra of substituted N-heterocyclic molecules. I. Spectra of substituted pyrimidines. S.L. Srivastava (Dept. of Phys., Univ. of Gorakhpur, Gorakhpur, India), M. Prasad.

Indian J. Phys. Part B, vol.56B, no.6, p.358-66 (Dec. 1982). [received: May 1983]

The author's work contains the electronic absorption spectra of 2 amino 4 methyl, 4,5 diamino, 2,4,6 triamino and 2,4 diamino 6 hydroxy pyrimidine in liquid state on Carl Zeiss UV VIS spectrophotometer in the region (50000-28000 cm^{-1}) and infrared absorption spectra of 2,4,6 triamino pyrimidine and 2,4 diamino 6 hydroxy pyrimidine dispersed in KBr disc on Carl Zeiss Specord 751R in the region 4000-4000 cm^{-1} . In view of the positions of the bands in the electronic spectra both $\pi-\pi^*$ and $n-\pi^*$ transitions were identified and on the basis of the positions of the typical infrared bands, tautomeric structures for 2,4,6 triamino and 2,4 diamino 6 hydroxy pyrimidine have been proposed. Probable modes of vibrations of the fundamentals have also been discussed. (9 refs.)

75378 Infrared spectra of OC-HX hydrogen-bonded complexes in solid argon. L. Andrews, R.T. Arlinghaus, G.L. Johnson (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6347-52 (1 June 1983).

The hydrogen-bonded complexes OC-HX (X=F, Cl, Br) have been prepared by condensing Ar/HX and Ar/CO reagent mixtures at 12K. FTIR spectra of the complexes are characterized by strong H-X absorptions (ν_X) displaced below the isolated HX fundamental, strong C-O absorptions displaced above the isolated CO fundamental, and sharp degenerate librational modes (ν_L) in the far infrared. Observation of a single degenerate ν_L mode indicates linear structures for the complexes. The displacements $\Delta\nu_X$ and $\Delta\nu_{CO}$ for the complexes decrease in magnitude in the series $\text{HF} > \text{HCl} > \text{HBr}$ in direct relationship with the trend in hydrogen bonding strength for the hydrohalic acids. (23 refs.)

75379 Infrared spectrum of the CO_2 -HCl complex in solid argon at 12K. L. Andrews, R.T. Arlinghaus, G.L. Johnson (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6353-7 (1 June 1983).

Co-condensation of CO_2 and HCl in excess argon at 12K produced the CO_2 -HCl hydrogen-bonded complex. Small shifts in the ν_X and ν_L modes, the low ν_L fundamental, and a very weak infrared Fermi doublet indicate a weakly bound complex. The more strongly bound CO_2 -HF and C^{18}O_2 -HF complexes gave more intense infrared Fermi doublets. The infrared intensity ratio ν_L/ν_X is 200/1 for the CO_2 -HF complex demonstrating that the HF ligand induces finite electrical asymmetry in the CO_2 submolecule. (12 refs.)

75380 Atomic charges and charge flows from infrared intensities: C-H bonds. M. Gussoni (Istituto di Chimica Industriale del Politecnico, Milano, Italy), P. Jona, G. Zerbi.

J. Chem. Phys. (USA), vol.78, no.11, p.6802-7 (1 June 1983).

Use is made of experimental infrared absorption intensities for calculating atomic charges and charge flows for a class of simple organic molecules. Various methods are discussed. Correlations of the calculated quantities with other independent structural parameters shed some new light on the peculiarities of the electrical properties of CH bonds. (26 refs.)

75381 Absolute band strengths of haloalkanes F-11 and F-12 in the 8-to-16- μm region. R.H. Kagann, J.W. Elkins (Gas and Particulate Sci. Div., NBS, Washington, DC, USA), R.L. Sams.

J. Geophys. Res. (USA), vol.88, no.C2, p.1427-32 (20 Feb. 1983).

The infrared strengths of three vibrational band systems of haloalkane F-11 and four vibrational band systems of haloalkane F-12 in the 'atmospheric window' between 8 and 16 μm were measured at $296 \pm 1\text{K}$ using a Fourier transform infrared spectrometer. These results were obtained at a maximum instrumental resolution of 0.06 cm^{-1} . The measurements of the total infrared band strengths for F-11 and F-12 would indicate approximately 17% and 5% greater absorbance, respectively, than those strengths used in recent greenhouse warming calculations by Ramanathan (1975). Wang et al. (1976), and Lalic et al. (1981), and consequently, a corresponding increase in the possible atmospheric warming effect by these haloalkanes. (28 refs.)

75382 Experimental and theoretical determination of the fundamental vibrations of 2-halo ethanol. I. Gauche conformers. G. Davidovics, J. Pourcin, M. Carles, L. Pizzala, H. Bodot (Centre de Saint-Jerome, Univ. de Provence, Marseille, France), L. Abouaf-Marguin, B. Gauthier-Roy.

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.165-78 (June 1983). In French.

From the Raman spectral study of X-CH₂-CH₂-OH and X-CH₂-CH₂-OD, X=F, Cl (liquid, solution, crystal) and from their IR spectra (4000 to 50 cm^{-1}) at different concentrations in CCl₄, CS₂ and C₆H₁₂ solutions, a coherent assignment of the fundamental vibrations was established for the gauche conformers of these molecules as auto-associated or monomeric species. The experimental and theoretical (GVFF calculations) results are shown to be consistent with a C₂ pseudosymmetry for the gauche conformer of 2-fluoroethanol. (27 refs.)

75383 N-H... π hydrogen bonding: infrared study of N-cyclohexylformamide-aromatic donor systems. A.D. Nikolic, N.L. Kobilarov, A.N. Brzic (Inst. of Chem., Univ. of Novi Sad, Novi Sad, Yugoslavia).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.179-88 (June 1983).

Hydrogen bonding of N-cyclohexylformamide with benzene, toluene, ethylbenzene, n-propylbenzene and n-butylbenzene in CCl₄ solutions has been studied in the fundamental NH stretching vibration region. The formation constants for hydrogen bonded complexes are determined over the temperature range 25-60°C. The corresponding thermodynamic parameters are obtained and it is concluded that a weak hydrogen bond is formed. IR spectral and thermodynamic data are correlated and n-alkyl substituent effects considered. The results are also compared with GLC data obtained for the same systems. (28 refs.)

75384 IR and ^1H NMR studies on the hydrogen bond in homoconjugated cations of some pyridine N-oxides in nitromethane and acetonitrile. M. Szafar, Z. Dega-Szafar (Dept. of Chem., A. Mickiewicz Univ., Poznan, Poland).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.189-95 (June 1983).

The IR spectra of seven hemiperchlorates of substituted pyridine N-oxides, which contain crystallographically symmetric and very short hydrogen bonds, have been investigated in dry nitromethane and acetonitrile- d_3 , and the following parameters obtained: $\nu_{\text{H}} \sim 1180 \text{ cm}^{-1}$, $A^{\text{H}}/A^{\text{D}} \sim 1.67$ and $\nu_{\text{H}}/\nu_{\text{D}} \sim 1.14$. The centre of gravity, ν_{H} , of the broad and strong absorption is, within experimental error, independent of the strength of the base used. The values of $\nu_{\text{H}}/\nu_{\text{D}}$ obtained suggest either a single asymmetrical minimum (as) or two unequal minima (ad) potential function. The chemical shift of the H-bonded protons of the investigated hemiperchlorates have been measured in dry nitromethane and acetonitrile and the values obtained (δ varies from 18.3 to 18.7 ppm) are lower than those observed in acid salts of carboxylic acid with a similar O...O distance. It is shown that the observed ca. 1 ppm upfield shift in hemiperchlorates relative to acid salts is caused by the diamagnetic anisotropy of the pyridine ring and not by the hydrogen bond strength. (25 refs.)

75385 Vibrational studies on conformational equilibrium in dimethylmethylphosphonate and methylidimethylphosphinate. B.J. Van Der Veken, M.A. Herman (Lab. voor Anorganische Scheikunde, Rijksuniv. Centrum Antwerpen, Antwerp, Belgium), A.J. Barnes.

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.197-206 (June 1983).

Low temperature Raman data, supplemented with Raman and IR solution spectra are used to assess and quantify the presence of two conformers in the liquid phase of both $\text{CH}_3\text{PO}(\text{OCH}_3)_2$ and $(\text{CH}_3)_2\text{PO}(\text{OCH}_3)$. From profile analysis of the $\nu(\text{P}=\text{O})$ region at different temperatures a liquid phase ΔH value of $3.3 \pm 0.4 \text{ kJ mol}^{-1}$ is established for $\text{CH}_3\text{PO}(\text{OCH}_3)_2$, while it is shown that a Fermi resonance in this mode prevents the abstraction of the corresponding ΔH value in $(\text{CH}_3)_2\text{PO}(\text{OCH}_3)$. (9 refs.)

75386 Assignment of the M-C stretching and M-C-O deformation modes of some trigonal bipyramidal metal carbonyls. M. Van Rentergem, E.G. Claeys, G.P. Van Der Kelen (Lab. for General & Inorganic Chem., Univ. of Ghent, Ghent, Belgium).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.207-16 (June 1983).

A novel assignment of the $\nu(\text{Co})$ and $\delta(\text{CoO})$ modes of the compounds $\text{ClHgCo}(\text{Co})_4$, $\text{Hg}(\text{Co}(\text{Co})_4)_2$, $\text{Co}_2(\text{Co})_8$ and their axially substituted derivatives is presented. This assignment is based on a comparison of the frequency shifts due to substitution with the shifts observed in the spectra of the corresponding iron carbonyl compounds. The $\nu(\text{Fe})$ and $\delta(\text{FeO})$ vibrations are assigned unambiguously. (22 refs.)

75387 Infrared cryogenic studies. XV. Chloroalkanes in argon matrices. A.J. Barnes, M.L. Evans, H.E. Hallam (Dept. of Chem., Univ. Coll. of Swansea, Swansea, Wales).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.235-45 (June 1983).

Infrared spectra are reported for chloroethane, chloropropane and chlorobutanes trapped in argon matrices at 10K. The spectra obtained are consistent

with the gas-phase conformational equilibrium having been trapped out in the matrices, both conformers of the primary chloropropane and chlorobutanes and all three conformers of the secondary 2-chlorobutane being observed. (15 refs.)

75388 Chloroacetyltriphenylphosphonium and the corresponding phosphorane. Physical chemistry and conformation study. J.P.Henichart (INSERM U-16, Lille, France), R.Houssin, C.Vaccher, M.Foulon, F.Baert. *J. Mol. Struct. (Netherlands)*, vol.99, no.3-4, p.283-93 (June 1983). In French.

The structures of chloroacetyltriphenylphosphonium and the corresponding phosphorane have been studied by IR, NMR (^1H , ^{13}C , ^{31}P) and X-ray crystallography. The compounds have analogous conformations, especially when an enolic form of the phosphonium last is considered. The molecules are nearly planar with phosphorus, oxygen and chlorine atoms being cis-cis with each other. This arrangement explains the ability of the phosphorane to undergo reactions in which these reactive centers are involved. (17 refs.)

75389 Shape of the $\nu(\text{OH})$ band in the IR spectra of H-complexes of pentachlorophenol. S.E.Odinkov, A.A.Mashkovskii, Z.A.Tarankova. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.947-52 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.284-90 (Aug. 1982). [received: April 1983]

The main attention in this work was paid to the investigation of changes in the shape of the $\nu(\text{OH})$ band in the H-complex depending on the strength of the bases. The changes in the $\nu(\text{OH})$ band were followed beginning with the weak H-complex of PCP (pentachlorophenol)-hexane up to the strongest complex of PCP-2,4,6-collidine (beginning of protonation of the base). The Fermi resonance nature of the appearance of a multiplet character in the structure of the $\nu(\text{OH})$ band in the entire series of variation of the strength of H-complexes was demonstrated. Strong Fermi resonance interactions of the stretching vibration $\nu(\text{OH})$ with combinations of deformational $\delta(\text{OH})$ and low frequency O-H...B vibrations were detected. This interaction leads to the appearance of two intense bands (D and E) in the IR spectra of strong H-complexes in the region of 400-1600 cm^{-1} . (13 refs.)

75390 The Q branch of 21^0-01^0 band of N_2O . Shen Zhiye, Liu Hui-fang (Dalian Inst. of Chem. Phys., Acad. Sinica, Beijing, China). *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol.28, no.2, p.213-15 (Feb. 1983).

The vibration-rotation spectra of N_2O are among the most thoroughly investigated IR spectra in the literature. Recently, the observation made by C. Amiot et al. (1976) gave molecular constants with great precision. There is, however, no information yet on the Q branch of the 21^0-01^0 band. The authors measurements were made by using a Laser Analytics model LS-3 tunable diode laser source IR spectrometer. The resulting spectra is shown. The whole spectra obtained are composed of 4 regions. Between 2577.1 and 2578.8 cm^{-1} , 37 lines of the Q branch were observed, most of which were well separated, while a few lines were mutually overlapping. The half-width of any single line, about 0.006 cm^{-1} , was somewhat broader than the Doppler width. (2 refs.)

75391 Highly strained single and double bonds. J.Michl, G.J.Radziszewski, J.W.Downing (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA), R.D.Miller, P.Kovacic, M.Jawdosiuik, V.Bonacic-Koutecky. *Pure & Appl. Chem. (GBC)*, vol.55, no.2, p.315-21 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

The infrared spectra of the strained single bond compounds, [2.2.1]propellane, [2.1.1]propellane and [1.1.1]propellane, and the vibrational and electronic spectra of the strained bridgehead double bond compounds, adamantene and azahomoadamantene, are reported and discussed. (24 refs.)

75392 Solvent effects on the infrared active CO stretching frequencies of some metal carbonyl complexes. I. Dimanganese decarbonyl and dirhenium decarbonyl. D.J.Parker (Chem. Section, South London Coll., London, England). *Spectrochim. Acta Part A (GB)*, vol.39A, no.5, p.463-76 (1983).

The infrared spectra of $\text{Mn}_2(\text{CO})_{10}$ and $\text{Re}_2(\text{CO})_{10}$ have been measured in the CO stretching region in the gas phase and in each of seventy four solvents and solvent shifts related to the parameter δ_ν . Using straight chained hydrocarbon solvents, there is a linear relationship between band frequency and δ_ν for all three $\nu(\text{CO})$ modes for both compounds. While effects on $\nu_2(b)$ and ν_1 modes are similar for each compound a much larger effect occurs on the $\nu_3(a)$ mode of $\text{Re}_2(\text{CO})_{10}$ than that on the same mode of $\text{Mn}_2(\text{CO})_{10}$. It is suggested that this is associated with greater double bond character in the axial CO groups reflected in the stronger Re-Re bond for $\text{Re}_2(\text{CO})_{10}$. Deviations that are both positive and negative are observed for all other solvents. Usually positive deviations occur with the highest frequency $\nu_3(b)$ modes and negative deviations with the other modes. For polar solvents this has been explained in terms of the relative contribution of triple and double bond character to the CO groups involved and hence the sign of μ' (the change in dipole moment with respect to the vibrational coordinate of the solute bond). As the alkyl chain is lengthened deviations become less positive (or more negative). This is explained from increase in +I effect of the alkyl group causing more polarity in the functional group which leads to a more negative value for μ' . Trends in solvent effect for branch chain hydrocarbons, alkenes and alkyl benzenes are also discussed. (12 refs.)

33.20F Raman and Rayleigh spectra (inc. scattering)

75393 Surface enhanced Raman scattering (SERS) from pyridine on silver-UHV interfaces: excitation spectra. I.Pockrand, J.Billmann, A.Otto (Phys. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany).

J. Chem. Phys. (USA), vol.78, no.11, p.6384-90 (1 June 1983). Excitation spectra of various surface enhanced Raman lines of pyridine adsorbed to evaporated silver films (1 L exposure) in UHV have been measured. Relative to ordinary scattering from thick pyridine layers on SERS inactive Ag films, every vibration exhibits a resonance profile which peaks at the same Stokes frequency corresponding to 2.0 eV independent of vibration. This value is shifted to the red after additional adsorption of 10^{-1} L of pyridine on the SERS active film. The ratio of corresponding Raman line intensities from 'bulk' and 'surface' pyridine varies differently for different vibrations with exciting frequency. The results are discussed with respect to various proposed enhancement mechanisms. (44 refs.)

75394 Vibrational and conformational studies of cyclopropylcarbonyl chloride. J.R.Durig, H.D.Bist, S.V.Saari, J.A.Smoother Smith, T.S.Little (Dept. of Chem., Univ. of South Carolina, Columbia, SC, USA).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.217-33 (June 1983). The infrared (3500 to 20 cm^{-1}) and Raman (3200 to 10 cm^{-1}) spectra have been recorded for gaseous and solid cyclopropylcarbonyl chloride, $\text{C}_3\text{H}_5\text{CClO}$. Additionally, the Raman spectrum of the liquid has been recorded and qualitative depolarization values have been obtained. It has been determined that the conformer with the oxygen atom cis to the three-membered ring is the predominant form at ambient temperature in both the gaseous and liquid states but only the trans conformer is present in the spectra of the solid. The observed changes in ΔH in going from the gas to the liquid state indicates strong intermolecular association in the condensed phases which can account for the existence of the trans conformer in the solid state. The torsional mode has been tentatively assigned at 72 cm^{-1} in the far infrared spectrum of the vapor for the cis conformer, and for the trans conformer at $\sim 50 \text{ cm}^{-1}$. From these frequencies and the ΔH for the gas, estimates are given for the values of the coefficients of the Fourier expansion of the potential function for internal rotation. (22 refs.)

75395 Synthesis and structural study of N-ethylnorbornane-3-spiro-5'-oxazolidine-2,4'-dione and its hydrochloride. E.Galvez (Dept. de Química Orgánica, Univ. de Alcalá de Henares, Madrid, Spain), M.Martínez, G.G.Trigo, M.V.López, F.Florencio, P.Smith-Verdier, S.García-Blanco. *J. Mol. Struct. (Netherlands)*, vol.99, no.3-4, p.247-58 (June 1983).

N(8)-Ethylnorbornane-3-spiro-5'-oxazolidine-2,4'-dione hydrochloride has been synthesized and its crystal and molecular structures determined by X-ray diffraction, IR, Raman, ^1H NMR and ^{13}C NMR methods. It is found that the crystalline structure is maintained in D_2O solution. In D_2O solution a protonation equilibrium takes place and the percentages of the two isomers are calculated. In order to correlate the results, analogous spectroscopic measurements have also been made for the N-ethylnorbornane-3-spiro-5'-oxazolidine-2,4'-dione, for which a zwitterionic structure is deduced. (22 refs.)

75396 Two-photon Raman excitation and coherent anti-Stokes Raman spectroscopy probing of population changes in polyatomic molecules: a novel nonlinear optical technique for vibrational-relaxation studies. S.M.Gladkov, M.G.Karimov, N.I.Koroteev (Dept. of Phys., Moscow State Univ., Moscow, USSR). *Opt. Lett. (USA)*, vol.8, no.6, p.298-300 (June 1983).

Two-photon Raman excitation is used to populate selectively vibrational states in CO_2 and SF_6 . The collisional population of 01^0 , 02^0 , 03^0 , etc. by means of 10^0 and 02^0 states in CO_2 gas is studied by coherent anti-Stokes Raman spectroscopy. No population transfer is observed between Fermi-resonant $\text{CO}_2(10^0)$ and $\text{CO}_2(02^0)$ states with the rate constant $K \approx 7 \cdot 10^4 \text{ sec}^{-1} \text{ Torr}^{-1}$. The lifetime of the $\text{SF}_6(100000)$ state is found to be $\tau \approx 15 \mu\text{sec}$ Torr. (14 refs.)

75397 Electronic structure of model chlorophyll systems. W.D.Edwards, M.C.Zerner (Dept. of Chem., Univ. of Guelph, Guelph, Ontario, Canada).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1407-32 (April 1983). An examination of the ground and excited states of magnesium porphine and pheophorine and their positive and negative ions using the intermediate neglect of differential overlap/spectroscopic method is reported. It is found that rather large changes in the Mg out-of-plane coordinate can be attained at very little cost in energy. These geometric changes alone can be used to explain the large range of spectroscopic shifts observed in the visible band of chlorophyll that are site dependent. These calculations also show a porphyrin to Mg charge transfer excitation at about 20000 cm^{-1} , which, if populated and allowed to relax, becomes the lowest excited singlet. This suggests that the initial photochemical event in photosynthesis may be excitation to the visible Q band followed by internal conversion to the charge transfer state accompanied by movement of the Mg atom out of the plane of the ring. This movement could result in intermolecular charge transfer, and relaxation of the Mg atom back to the plane of the ring. The nature of the positive and negative ions of these model chlorophylls is discussed in light of their role as

the electron donor and their potential role as initial electron acceptor in photosynthesis. (49 refs.)

75398 Electronic spectra and excited state dipole moments of heterocyclic pentaatomic systems and their benzo and dibenzo derivatives. G.Buemi, F.Zuccarello, G.Romeo (Istituto Dipartimentale di Chimica e Chimica Industriale, Univ. di Catania, Catania, Italy).

THEOCHEM (Netherlands), vol.11, no.1-2, p.115-26 (June 1983).

The heterocyclic systems furan, pyrrole and thiophene, as well as their benzo and dibenzo derivatives, have been studied by INDO/S and CINDO/SHIFT/UV methods in order to rationalize their electronic structure and UV spectra, and to calculate the excited state dipole moments. The importance of the doubly excited configurations was tested by means of the CINDV99 program. It is found that the biexcited configurations strongly influence the lowest energy weak band at about 5 eV, which is always predicted to arise from a singlet-singlet transition. The triplet states are not well calculated but it is not to be excluded that a singlet-triplet transition is overlapping with the previous singlet-singlet one. The optical UV spectrum of the sulphurated compounds is well interpreted without *d* orbital inclusion since the MOs involved in the transitions occurring below 7 eV arise nearly exclusively from *p* atomic orbitals. The small variations of dipole moments on passing from the ground to the lowest excited states suggest negligible solvent effect in the molecules examined. (39 refs.)

75399 Rotational analysis of the $A''\Pi-X''\Sigma^+$ bands of $^{28}\text{Si}^{34}\text{S}$: perturbation studies in the $A''\Pi$ state. G.Krishnamurthy, S.Gopal, P.Saraswathy, G.Lakshminarayana (Spectroscopy Div., Bhabha Atomic Res. Centre, Bombay, India).

Can. J. Phys. (Canada), vol.61, no.5, p.714-24 (May 1983).

The ultraviolet bands of the $A''\Pi-X''\Sigma^+$ system of a $^{28}\text{Si}^{34}\text{S}$ molecule were excited in emission in an electrodeless discharge tube and photographed in the fourth order of a 10.6 m Ebert grating spectrograph. Rotational analysis of thirteen bands lying in the region 2600-3000 Å was carried out. Perturbations observed in the $v=0-7$ levels of $A''\Pi$ were attributed to the perturbing states $e''\Sigma^-$, $d''\Delta$, $C''\Sigma^-$, and $D''\Delta$. Origins of the bands involving $v''=2, 6$, and 7 were found to have shifted from their expected positions, presumably due to perturbations. (9 refs.)

75400 Ultraviolet bands in diatomic mercury bromide. A.K.Rai, S.B.Rai, D.K.Rai (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).

J. Phys. B (GB), vol.16, no.11, p.1907-13 (14 June 1983). The emission bands of diatomic mercury bromide molecule lying in the ultraviolet region have been reinvestigated under moderately high resolution. The bands observed in the wavelength range 2770-2700 Å (previously identified as a new D'-X system) simply form an extension (to high $|\Delta v|$ values) of the well known C-X system. The vibrational assignment of the bands has been confirmed by measuring the well resolved bromine isotope shift. In some bands structure due to mercury isotopes is also resolved. Precise vibrational constants for the X, C, D and E states and approximate rotational constants for the X, C and D states are reported. The E-X transition is shown to consist of two subsystems indicating that the E state is a $^2\Pi$ state. (6 refs.)

75401 Nature of deformation of ultraviolet absorption spectra of complex organic molecules. O.N.Glagoleva, M.G.Reva, V.D.Ryzhikov.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.546-9 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.776-80 (May 1982). [received: Feb. 1983]

Clarifies the nature of the deformations of the electronic absorption spectra during association of complex organic molecules in the UV part of the spectrum, and outlines the possibility of explaining them according to concepts developed for the visible region. The examples used are potassium cosine and rhodamine 6Zh. (7 refs.)

75402 Rydberg series in the absorption spectrum of Te I limiting on $5s^2 5p^4 S_{3/2}^0$ ionization limit. A.M.Catnu, M.Mazzoni (Osservatorio Astrofisico di Arcetri, Firenze, Italy), Y.N.Joshi.

Phys. Scr. (Sweden), vol.27, no.4, p.261-6 (April 1983).

The absorption spectrum of tellurium was photographed in the region 1000-2260 Å on a variety of spectrographs ranges in dispersion from 1.245 to 4.17 Å mm $^{-1}$. The absorption cell consisted of a flash pyrolysis system and the background continuum source consisted of a BRV source or a Garton flash lamp. The new observations have led to great extensions in eight Rydberg series limiting on $5p^3 \ ^4S_{3/2}^0$. One hundred and seventy five lines are classified in the region 1380-2260 Å quadrupling the number of classified lines previously reported in the literature. (21 refs.)

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

75403 The importance of the localization of the π -electron system on its ability to transmit the Fermi contact term of H-H coupling constants. A theoretical and experimental study. J.C.Facelli, R.H.Contreras, D.G.de Kowalewski, V.J.Kowalewski, R.N.Piegaia (Dept. de Fisica, Univ. de Buenos Aires, Buenos Aires, Argentina).

THEOCHEM (Netherlands), vol.11, no.1-2, p.163-72 (June 1983).

Semiquantitative relationships between the localization of a π -electron system and its capacity to contribute to the spin-spin coupling constants are found theoretically and experimentally. Theoretically, enlargements of the INDO basis set and the tautomeric structures of 2-hydroxypyridine are used. Experimentally, the long-range H-H coupling constants in 6-methyl-2-pyridone are compared with the corresponding couplings in 2-X-6-methylpyridines (X=amino, formyl, cyano). Evidence shows that the π -contribution to the H-H coupling constants is greater when the localization of this electron system is increased: $-(39 \text{ refs.})$

75404 Intermolecular potentials from NMR data: H $_2$ -N $_2$ O and H $_2$ -CO $_2$. Lakshman Pandey, C.P.K.Reddy, K.Lalita Sarkar (Dept. of Phys., Indian of Technol., Kanpur, India).

Can. J. Phys. (Canada), vol.61, no.5, p.664-70 (May 1983).

Proton spin-lattice relaxation times T_1 were measured in mixtures of H $_2$ with N $_2$ O as a function of density, composition, and temperature (200-400K) in the region where $T_1 \propto \rho$. These data, along with the data obtained by Lalita and Bloom (1969) for H $_2$ -CO $_2$, were interpreted, using Bloem-Oppenheim theory (1967), to obtain the anisotropic intermolecular potential parameters. Two models, (i) the Lennard-Jones (12-6) potential (LJP) and (ii) the modified Buckingham (exp-2) potential (MBP), were used to represent the isotropic part of the intermolecular potential. The relative anisotropy in the attractive r^{-6} term and the quadrupole moments of N $_2$ O and CO $_2$ as obtained from MBP model are in better agreement with the values obtained from the polarizability data and the reported values, respectively, than those obtained from the LJP model. (14 refs.)

75405 ^{77}Se NMR studies of organoselenium compounds. VI. Substituent effects in 2-substituted selenolo[2,3-b]selenophenes studied by ^1H , ^{13}C and ^{77}Se NMR spectroscopy. A.Konar (Div. of Organic Chem., Univ. of Lund, Lund, Sweden), V.P.Litvinov.

Chem. Scr. (Sweden), vol.22, no.1, p.22-9 (1983).

For pt.1 see *ibid.*, vol.19, p.5 (1982). ^1H , ^{13}C and ^{77}Se NMR spectra of a series of 2-substituted selenolo[2,3-b]selenophenes have been determined. Derivatives containing both strongly electron-attracting and electron-donating substituents, as well as substituents of intermediate character, were chosen. Comparison with the shifts of the corresponding thieno[2,3-b]thiophenes and with selenophenes showed great similarities and good linear correlations were obtained. The influence of substituents on the selenium atoms in both the substituent-bearing and neighbouring rings is discussed. Regression equations for some of the shifts and dual and triple substituent parameters are also given. Comparison of the results obtained with those for 2-substituted selenolo[3,2-b]selenophenes revealed certain differences in the transmittance of substituent effects to similar positions in the two systems. (26 refs.)

75406 Survey of structural regularities in molecular properties. I. Carbon-13 chemical shifts in alkanes. M.Randic (Dept. of Math. & Computer Sci., Drake Univ., Des Moines, IA, USA).

Int. J. Quantum Chem. (USA), vol.23, no.5, p.1707-22 (May 1983).

Many regularities in properties among structurally related compounds are known but a systematic approach to investigate all such cases is rare. A plan is outlined for a systematic study of structural regularities that is based on use of selected graph invariants as prime auxiliary quantities. In this paper carbon-13 chemical shifts in alkanes are examined. Since NMR spectra of paraffins are well understood, the example provides a useful illustration of the approach, introduces basic concepts, and illustrates the kind of results that the graph-theoretical scheme generates. Differences and similarities between graph-theoretical viewing of the problem of structural regularities and customary direct use of additives are discussed in some detail. (18 refs.)

75407 High resolution proton magnetic resonance study on metal-free porphyrins. D.V.Behere, S.Mitra (Chem. Phys. Group, Tata Inst. of Fundamental Res., Bombay, India).

Indian J. Chem. A, vol.21A, no.10, p.966-9 (Oct. 1982). [received: April 1983]

High resolution (270 MHz) PMR spectra of metal-free tetraphenylporphyrin (I), *p*-methyltetraphenylporphyrin and octaethylporphyrin (II) have been recorded. Fine structure multiplets due to spin-spin coupling have been observed in their spectra. The dynamical effect of inner N-H proton tautomerism on the peripheral porphyrin protons has also been investigated through variable temperature measurements. (10 refs.)

75408 Operator and algebraic methods for NMR spectroscopy. I. Generation of NMR spin species. K.Balasubramanian (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6358-68 (1 June 1983).

Algebraic methods are developed for generating NMR spin species and irreducible representations spanned by spin functions. These methods use generalized character cycle indices (S function when NMR groups are symmetric groups). A correspondence between the unitary group approach and the permutation group method for NMR is established by generating NMR Gel'fand states using Schur functions. The generalized character cycle indices of molecules whose NMR groups are expressible as generalized wreath products are shown to be generalized NMR plethysms of Schur functions. These techniques enable generation of spin species without the knowledge of the character tables of NMR groups. The author illustrates the methods developed here with several examples. The use of these techniques in generating symmetry-adapted NMR spin functions can be found in the accompanying paper. (18 refs.)

75409 Operator and algebraic methods for NMR spectroscopy. II. NMR projection operators and spin functions. K.Balasubramanian (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6369-76 (1 June 1983).

For pt.1 see *ibid.*, vol.78, no.11, p.6358-68 (1983). The author outlines double coset and restricted character cycle index methods which generate the equivalence classes of NMR spin functions and the irreducible representations in the representation spanned by spin functions in any equivalence class. Elegant

operator methods are developed by which the projection operators of NMR groups can be obtained in terms of the projection operators of composing groups. Thus, the projection operators of NMR groups of many molecules can be obtained without the knowledge of their character tables. Projection operators thus obtained are applied on the set of spin functions in an equivalence class of NMR spin functions (rather than the whole set of spin functions) which are generated by double coset methods to obtain symmetry-adapted NMR spin functions in the composite particle representation. Methods are illustrated with several examples of molecules containing as many as 2^{30} NMR spin functions. The methods developed here are quite general so that they can be applied to NMR of nuclei with multipin states and they do not require the character tables of NMR groups. The techniques outlined here are illustrated with 2,2,3,3-tetramethyl butane for which the symmetry-adapted NMR spin couplings are obtained in the composite particle representation. The NMR Hamiltonian matrix of this molecule which is of order $2^{18} \times 2^{18}$ is factored into $2^9 \times 2^9$ matrix by the composite particle treatment. This is further factored into 8 1×1 matrices and 6 4×4 , 4 2×2 , and 3 8×8 matrices in the symmetry-adapted basis. (7 refs.)

75410 Beam-maser spectroscopy on cyanoacetylene-D. L.M.Tack, S.G.Kukulich (Dept. of Chem., Univ. of Arizona, Tucson, AZ, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6512-14 (1 June 1983). The $J=1-0$ transition frequencies were measured for NCCD using a beam-maser spectrometer. Hyperfine structure from ^{14}N and D was completely resolved. Analysis of the data directly gives the ^{14}N and deuterium quadrupole coupling constant along the internuclear axis $eqQ(^{14}\text{N}) = -4318.0 \pm 0.1$ kHz, $eqQ(\text{D}) = 203.5 \pm 1.5$ kHz. From the data the spin-rotation constant on ^{14}N was also measured: $C(^{14}\text{N}) = 1.1 \pm 0.2$ kHz. The spin-rotation data were used to calculate paramagnetic chemical shift tensor components $\sigma_{xx} = \sigma_{yy} = -593 \pm 40$ ppm. These experimentally determined tensor components were combined with calculated diamagnetic tensor components to give the isotropic shift $\sigma_{av} = 18 \pm 27$ ppm. (16 refs.)

75411 ^1H and ^{13}C NMR and infrared spectroscopic study of the conformational equilibrium in S-methyl dithiocarbamate. S.Manogaran, D.N.Sathyanarayana (Dept. of Inorganic & Phys. Chem., Indian Inst. of Sci., Bangalore, India).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.267-73 (June 1983). Analysis of the variable temperature ^1H and ^{13}C and ambient temperature ^2H NMR spectra coupled with IR spectra of S-methyl dithiocarbamate shows that the results can be best rationalized in terms of a mixture of cis-cis and trans-cis conformers. The assignment of the proton chemical shifts has been supported by utilizing lanthanide induced shifts. The torsional barrier about the C-N bond has been determined; a full line shape analysis of the ^1H spectra at different temperatures has been made. The rotational behaviour in the N-protonated form relative to the free base is also noted. (20 refs.)

33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

75412 An electron bombardment procedure for generating cation and neutral radicals in solid neon matrices at 4K: ESR study of $^{14}\text{N}_2^+$ and $^{15}\text{N}_2^+$. L.B.Knight, Jr., J.M.Bostick, R.W.Woodward, J.Steadman (Chem. Dept., Furman Univ., Greenville, SC, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6415-21 (1 June 1983). A new generation technique for matrix isolated cations and neutrals involving the electron bombardment of the matrix sample during deposition is presented. Use of the method for the study of ion-neutral reactions and other types of matrix experiments is discussed. Results for the gas phase electron bombardment of $(\text{CH}_3)_2\text{O}$ are compared with electron bombardment of $(\text{CH}_3)_2\text{O}$ conducted during neon deposition. The relative amounts of N and N_2^+ radicals trapped in neon matrices have been measured as a function of electron energies. An ESR analysis of $^{14}\text{N}_2^+$ and $^{15}\text{N}_2^+$ generated by electron bombardment in neon matrices at 4K yields: $g_{\text{iso}} = 2.0004(2)$; $A_{\text{iso}}(^{14}\text{N}) = 104.1(6)$ MHz and $A_{\text{iso}}(^{15}\text{N}) = 146.1(6)$ MHz. The ESR results are used to estimate the extent of s-p hybridization of N_2^+ and a comparison with theoretical calculations and several other 13 electron diatomic radicals is made. (40 refs.)

75413 The laser magnetic resonance spectrum of the ν_3 band of HSO at 10 μm . T.J.Sears, A.R.W.McKellar (Herzberg Inst. of Astrophys. Nat. Res. Council of Canada, Ottawa, Ontario, Canada).

Mol. Phys. (GB), vol.49, no.1, p.25-32 (May 1983). The ν_3 (SO stretching) fundamental band of the HSO radical in the 10 μm region has been studied using the technique of intracavity CO₂ laser magnetic resonance. HSO was produced in a flow system by reacting the products of a microwave discharge in an $\text{O}_2 + \text{Ar}$ mixture with CH_3SH . Spectra in the 998 to 1016 cm^{-1} region were assigned to transitions with $N' \leq 7$ and $K' \leq 3$; their analysis yielded values of the ν_3 band origin, and the rotational and spin-rotational parameters for the (001) state. The authors were not able to assign any transitions to the ν_2 (bending) band, which should lie at somewhat higher frequencies, and these (010) state levels may perturb ν_3 band transitions with $K_a \geq 4$ through Coriolis interactions. (20 refs.)

The microwave and far-infrared spectra of the CH radical See Entry 75371

33.35 DOUBLE RESONANCES AND OTHER MULTIPLE RESONANCES

75414 Sub-Doppler infrared-infrared double resonance spectroscopy of NH_3 using Stark tuning and a diode laser. W.H.Weber, R.W.Terhune (Ford Motor Co., Dearborn, MI, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6437-46 (1 June 1983). Double resonance experiments on NH_3 are described in which a CO laser pumps a 6 μm ν_4 transition while a tunable diode laser probes a 10 μm ν_2 transition having a common lower level. Four different combinations of

pump-probe transitions are studied. The CO laser is Lamb-dip stabilized on the pump transitions, which are tuned into coincidence with it using a precision intracavity Stark cell. The pump and probe beams overlap colinearly in the Stark cell. The double resonance signals appear as narrow transmission peaks on the diode laser scans. The narrowest observed widths are ≈ 3 MHz (FWHM), a large portion of which is due to unresolved hyperfine structure. An analysis of the various broadening mechanisms indicates that the diode laser contributes less than 1 MHz to the widths. Resonances due to velocity-preserving but state-changing collisions are seen. Asymmetries between co- and counterpropagating linewidths are shown to arise from a combination of field inhomogeneity and coherent narrowing effects. The data are recorded using a computer-aided, rapid-scan, digital signal averaging technique. (28 refs.)

33.40 MÖSSBAUER SPECTRA

75415 Mossbauer studies of after effects of Auger ionization following internal conversion in organo- $^{129\text{m}}$ tellurium compounds. A.Nath, C.Sauer, A.Halpern (Inst. für Festkörperforschung, KFA Jülich GmbH, Jülich, Germany).

J. Chem. Phys. (USA), vol.78, no.8, p.5125-8 (15 April 1983). The after effects of Auger ionization of diphenyl- $^{129\text{m}}\text{Te}$ -telluride, dibenzyl- $^{129\text{m}}\text{Te}$ telluride, and their dispersions in a solvent at 4.2K, were compared with the same systems labeled with tellurium in the ground state, viz ^{127}Te . The Mossbauer emission, in the former case is preceded by an Auger event and β decay, while in the latter case, it is preceded only by β decay. Three species were observed in the two compounds, I^- , C_6H_5 or $\text{C}_6\text{H}_5\text{CH}_2$, and the third one has tentatively been identified as $(\text{C}_6\text{H}_5)_2\text{I}^+$ or $(\text{C}_6\text{H}_5\text{CH}_2)_2\text{I}^+$. The formation of I^- represents rupture of both bonds, i.e., complete fragmentation of the molecule. The probability of fragmentation was estimated with the help of matrix isolation experiments, as the electronically excited tellurium-129 ion formed by fragmentation of the molecule, following the Auger ionization, may interact with a neighboring organo-tellurium molecule in neat compounds, and enter combination. In about 85% of the events in case of diphenyl telluride and 55% in the case of dibenzyl telluride, molecules escape complete fragmentation despite the fact that about 100 eV excitation energy may be deposited during charge neutralization. A novel mode for rapid disposal of energy is discussed. (29 refs.)

33.45 MAGNETO-OPTICAL AND ELECTRO-OPTICAL SPECTRA; DICHROISM

75416 Electric birefringences and molecular conformations of 2-aryloxirans in solution. M.J.Aroney, K.E.Calderbank, H.J.Stootman (Dept. of Inorganic Chem., Univ. of Sydney, Sydney, NSW, Australia).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.259-65 (June 1983). Electric birefringence and dipole moment measurements have been made for five aryloxirans as solutes at 298K. The data are analysed to obtain information on the preferred solution-state conformations taking into account electronic and steric interactions between the aryl and oxiran ring systems. (33 refs.)

33.45B Zeeman and Stark effects

75417 Rotational Zeeman effect in ArHCl and ArDF . E.J.Campbell, W.G.Read (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6490-501 (1 June 1983). The molecular g values and magnetic susceptibility anisotropies of ArH^{35}Cl , ArH^{37}Cl , and ArDF have been measured using pulsed Fourier transform microwave spectroscopy carried out in a Fabry-Perot cavity located in the bore of a superconducting solenoid magnet. The measured magnetic parameters for these three molecules, obtained from rotational Zeeman splittings of $K=0$ R-branch transitions are given. The relationship between these measurements and the signs of the electric dipole moments, the molecular quadrupole moments, and the anisotropy in the second moments of the electronic charge distribution is discussed in detail, with particular emphasis on the effects of the large zero point bending motions present in these molecules. The relationships between the measured Zeeman parameters and the properties of the individual rare gas and hydrogen halide subunits is treated. The authors conclude that the contribution of the rare gas atom to the measured g_{\perp} values is negligibly small, but that the rare gas atom apparently does make a measurable contribution to the magnetic susceptibility anisotropies of at least the HF containing systems. 33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

75418 Observation of a metastable $^2\Delta$ state in BaCl. H.Martin, P.Royen (Inst. of Phys., Univ. of Stockholm, Stockholm, Sweden).

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.127-9 (13 May 1983). Laser-induced fluorescence of gaseous BaCl was studied in the 0.5-2.0 μm spectral region. Transitions to a metastable $^2\Delta$ electronic state were observed which made a rotational and vibrational analysis possible of the $\Omega=5/2$ component of this state. (12 refs.)

75419 Spectroscopic and picosecond time-resolved studies of vibrational relaxation in naphthazarine in solid neon. V.E.Bondybey, S.V.Milton, J.H.English, P.M.Rentzepis (Bell Labs., Murray Hill, NJ, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.130-4 (13 May 1983). Very extensive vibrationally unrelaxed fluorescence is observed following dye-laser excitation of single vibronic levels of naphthazarine. The rates and pathways of its vibrational relaxation are examined by means of picosecond emission spectroscopy. Analysis of its vibrational and electronic spectra establishes a C_{2v} symmetry for free naphthazarine. (12 refs.)

75420 Vibrational redistribution in jet-cooled perylene. Intermediate coupling case. C.Bouzou, C.Jouvet, J.B.Lebland, P.Millie, A.Tramer (CENS, Gif-sur-Yvette, France), M.Sulkes. *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.161-6 (13 May 1983). Fluorescence excitation spectra (FES) and fluorescence spectra (FS) under single vibronic level excitation of perylene in a supersonic jet are reported. The fluorescence from the lowest vibronic levels of the S_1 state is purely resonant while for $\delta E_{vib} > 1600 \text{ cm}^{-1}$ broad-band emission spectra weakly dependent on ν_{exc} are explained by vibrational redistribution with a characteristic time $5 < \tau_{red} < 100 \text{ ps}$. In the intermediate δE_{vib} range ($700\text{--}1600 \text{ cm}^{-1}$) complex emission spectra correspond to a strong coupling between the doorway state and a small number of 'dark' states. The data are discussed in terms of a model assuming a rapid variation of the anharmonic coupling constant with the overall change of the vibrational quantum number between interacting levels. (8 refs.)

75421 Photosensitized luminescence of singlet oxygen in polymeric films. I.M.Bytva, G.P.Gurinovich, O.L.Golomb, V.V.Karpov (Inst. of Phys., Acad. of Sci., Minsk, USSR). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.167-9 (13 May 1983). Singlet oxygen luminescence has been discovered in polymeric polyethyleneterephthalate and triacetate films coloured by porphyrin, triipallavine and anthraquinone dyes. Quantum yield of porphyrin-sensitized O_2 emission in a polyethyleneterephthalate film has been estimated to be 10^{-6} . The experimental evidence supports the fact that oxygen dissolved in a polymer matrix luminesces. (10 refs.)

75422 Oscillator strength of the $CN A^2\Pi_u \rightarrow B^2\Sigma^+ (0,0)$ transition. J.B.Halpern, Xiao Tang (Dept. of Chem., Howard Univ., Washington, DC, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.170-4 (13 May 1983). The relative oscillator strength of the $A^2\Pi_u \rightarrow B^2\Sigma^+$ transition has been measured by comparing the laser-induced fluorescence signal from excitation of a known distribution of $CN A^2\Pi_u$ and $CN B^2\Sigma^+$ produced by the photodissociation of cyanogen at 158 nm . The oscillator strength of the $A^2\Pi_u \rightarrow B^2\Sigma^+$ transition is 0.011 ± 0.006 times that of the $X^2\Sigma^+ \rightarrow B^2\Sigma^+$ system. This leads to a value of $(4.0 \pm 2.2) \times 10^{-4}$ for the band oscillator strength. (15 refs.)

75423 Room-temperature rate constants for the gas-phase quenching of metastable molecular oxygen, $O_2(a^1\Delta_g)$ and $O_2(b^1\Sigma_g^+)$, by CO_2 , N_2O , NO , NH_3 , HCl and SO_2 . R.B.Boodaghians, P.M.Borrell, P.Borrell (Dept. of Chem., Keele Univ., Keele, England). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.193-7 (13 May 1983). The rate constants for collisional quenching of $O_2(b^1\Sigma_g^+)$ by CO_2 , N_2O , NO , NH_3 , HCl and SO_2 , and $O_2(a^1\Delta_g)$ by NO , NH_3 and HCl have been measured at room temperature by studying the emissions of singlet molecular oxygen at 762 and 634 nm in a flowing discharge. The rate constant for deactivation of $O_2(a^1\Delta_g)$ by SO_2 , determined from extrapolation of high-temperature data, is also reported. A comparison is made with previous results. (24 refs.)

75424 Spectroscopy and dynamics of jet-cooled 1,1'-binaphthyl. H.T.Jonkman, D.A.Wiersma (Chem. Dept., Univ. of Groningen, Groningen, Netherlands). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.261-4 (20 May 1983). Fluorescence excitation and dispersed fluorescence spectra of jet-cooled 1,1'-binaphthyl are reported and analysed. The spectra indicate that in the ground and excited state the naphthalene rings are perpendicular to one another. The spectra can be further interpreted in terms of an exciton model with an exciton splitting of 21 cm^{-1} in the origin. From the structureless emission spectrum and lifetime it is concluded that, in the isolated molecule, efficient vibrational relaxation occurs through conversion of vibrational into librational energy. (17 refs.)

75425 UF_6 relaxation dynamics following near-ultraviolet excitation. S.Castiglione, G.Freddi, P.Morales (Lab. Tecn. Spec. ENEA, Rome, Italy). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.319-23 (20 May 1983). Collisional relaxation dynamics of UF_6 following excitation in the first electronic absorption band is studied by an investigation of the red-shifted emission. A comparison with dissociation data is made and a simple kinetic model proposed previously is improved. (13 refs.)

75426 Study of optical relaxation of polyatomic molecules in the condensed phase by site-selective laser spectroscopy. M.N.Sapozhnikov, V.I.Alekseev (Laser Spectroscopy Lab., Inst. for Biological Tests of Chem. Compounds, Moscow, USSR). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.331-6 (20 May 1983). Fluorescence line narrowing and hole burning in absorption spectra have been used for a study of electronic and vibrational relaxations and inhomogeneous distribution function for coporphyrin III molecules in solid ethanol and *n*-octane matrices in the temperature range from 3.2 to 26 K . (18 refs.)

75427 Intramolecular charge-transfer fluorescence from 9,9'-bianthryl absorbed on porous glass. N.Nakashima, D.Phillips (Davy Faraday Res. Lab., Royal Inst., London, England). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.337-41 (20 May 1983). 9,9'-bianthryl (BA) absorbed on porous glass exhibits both intramolecular charge-transfer (CT) and anthracene-like fluorescence. The CT fluorescence exhibits no temperature dependence, suggesting that orientational relaxation on the time scale of fluorescence decay is absent. Complex fluorescence decay characteristics from BA and 9,10-diphenyl anthracene (DA) absorbed on the glass are interpreted in terms of absorption on a variety of sites. (18 refs.)

75428 Fluorescence excitation and multiphoton ionization spectroscopy of 3-methylindole in a supersonic jet. T.R.Hays, W.E.Henke, H.L.Selzle, E.W.Schlag (Inst. for Phys. & Theoretical Chem., Tech. Univ. of Munich, Garching, Germany). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.4-5, p.347-51 (27 May 1983). The fluorescence excitation and multiphoton ionization spectroscopy of 3-methylindole (skatole) is reported. One electronic origin (1L_b) is assigned at 34875 cm^{-1} , the second (1L_a) suspected at 35483 cm^{-1} . Some 1L_a vibrational assignments are also made. Complex formation between skatole and some small molecules is indicated but not directly observed. (13 refs.)

75429 Irreversibility, time, and fluctuations in quantum statistical theory of dissipative molecule systems. II. Application to fluorescence spectroscopy. C.A.Chatzidimitriou-Dreismann (Iwan N. Stranski-Inst. for Phys. & Theoretical Chem., Tech. Univ. of Berlin, Berlin, Germany). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1505-16 (April 1983). For pt.I see Int. J. Quantum Chem. Quantum Chem. Symp., vol.16, p.195 (1982). Some basic concepts of the Prigogine quantum statistical theory of irreversible processes are discussed in connection with a previous paper by Chatzidimitriou-Dreismann and Lippert (1982). The removal of the 'dual role' that the Hamiltonian plays within conventional quantum theory corresponds to the introduction of a star-unitary operator \mathcal{U} called 'intrinsic time'. The formalism of the previous paper is extended to systems that interact with external fields. A formal specification of \mathcal{U} furthermore, follows from the Li invariance of the basic equations of motion and its connection with the intrinsic time. As an application to fluorescence spectroscopy, a photon counting experiment is presented. It allows the authors to detect certain predicted 'dynamical' fluctuations in emission spectra. Some current experimental results are reported concerning the resolution of the broad fluorescence band of fluoranthene (dissolved in ethanol) through detection of the underlying finer vibrational structure. (15 refs.)

75430 Laser-induced fluorescence spectrum of the CCN radical with an Ar^+ laser. K.Hakuta, H.Uehara (Sagami Chem. Res. Center Nishi-Ohnuma, Kanagawa, Japan). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6484-9 (1 June 1983). The laser-induced fluorescence (LIF) spectrum of the CCN radical was observed with an Ar^+ laser. The laser line of 465.8 nm coincided with two rovibronic transitions: R_1 (23.5) and R_{21} (12.5) for $A^2\Delta_2(010)\Phi \rightarrow X^2\Pi_2(010)\Delta$. The LIF spectrum consisted of the resonant series: $A^2\Delta_2(010)\Phi \rightarrow X^2\Pi_2(v_1v_2v_3)\Delta$, and the collision-induced bands: $A^2\Delta_2(010)\Pi \rightarrow X^2\Pi_2(v_1v_2v_3)\Sigma^+$, Σ^- . The analysis yielded the vibrational and the vibronic parameters of the ground electronic state $X^2\Pi_2$. (18 refs.)

75431 Quantum interference phenomena in the radiative decay of the $\tilde{C}(^1B_2)$ state of SO_2 . M.Ivanco, J.Hager, W.Sharfin, S.C.Wallace (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6531-40 (1 June 1983). Quantum beat effects in the fluorescence decay of the $\tilde{C}(^1B_2)$ state of SO_2 have been analyzed in detail and the coupling mechanism, which gives rise to the quantum interference phenomena identified as vibronic mixing with the ground state. The use of transform-limited dye laser pulses for excitation permitted both the sensitive detection of weakly modulated quantum beats and a direct quantitative analysis of the magnitude of the interstate coupling. Small Zeeman shifts were also observed to be present, but because these are less than $1/20$ of those observed for singlet-triplet interactions in SO_2 and other molecules, they are attributed to indirect coupling effects via the ground state. The onset for predissociation at 218 nm is marked by the disappearance of the quantum beats and both confirms the vibronic coupling model and yields a spectroscopic measure of the ground state dissociation energy. Thus the dynamical behavior of the $\tilde{C}(^1B_2)$ state of SO_2 has been uniquely characterized through analysis of the quantum interference effects arising through interstate coupling and is the first such example in the limit of a sparse density of states in a polyatomic molecule. (30 refs.)

75432 Photophysical anomalies of acridine in *n*-hexane. W.S.Struve, J.H.Hedstrom, C.G.Morgante (Dept. of Chem., Iowa State Univ., Ames, IA, USA), A.K.Jameson, E.C.Lim. *J. Chem. Phys. (USA)*, vol.78, no.11, p.7006-8 (1 June 1983). The photophysics of acridine excited in its lowest-lying π, π^* state in various solvents has remained problematic despite several recent picosecond transient absorption and fluorescence studies. Room temperature risetimes of the 432 nm $T_0 \rightarrow T_1$ transient absorption of acridine exhibit wide solvent variations, ranging from $\sim 40 \text{ ps}$ in *n*-hexane to $\sim 200 \text{ ps}$ in ethanol. The authors present evidence that the $T_0 \rightarrow T_1$ transition absorption risetime of acridine in *n*-hexane is much more weakly temperature dependent than the reported fluorescence decay time. The fluorescing state and T_1 are therefore not directly coupled. Acceleration of $S_1 \rightarrow S_0$ internal conversion by the proximity effect does not appear to dominate the photophysics of acridine. (12 refs.)

75433 Twisted intramolecular charge transfer (TICT) excited states: energy and molecular structure. Z.R.Grabowski, J.Dobkowski (Inst. of Phys. Chem., Polish Acad. of Sci., Warsaw, Poland). *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.245-52 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982). Numerous compounds of donor (D)-acceptor (A) type, in the excited singlet state undergo a relaxation to a highly polar state, preferentially in fluid polar solvents. Study of the rigid model molecules revealed the polar state to correspond to the D and A moieties mutually twisted by 90° . To find another proof for the structure of the TICT states, the energies of their emission were calculated for 18 molecules starting from the TICT model. The calculated values are compared to the 'polar' fluorescence maxima. The correlation may serve as a structural proof for the TICT states. (57 refs.)

33.65 PHOTOELECTRON SPECTRA

75434 Theoretical study of electron transmission through N_2 . H.Estrada, M.Berman, L.S.Cederbaum, W.Domecke (Inst. fur Phys. Chem., Univ. Heidelberg, Heidelberg, Germany).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.352-6 (27 May 1983).

The objective of the present work is to unfold the population of the vibrational levels from the experimental electron transmission spectra of N_2 . This is accomplished by comparing these spectra with theoretical spectra which have been obtained using computed resonant vibrational excitation cross sections and assuming a Boltzmann distribution for the population of the vibrational levels of the N_2 target molecule. The cross sections are calculated using an accurate non-local energy-dependent complex potential for the vibrational motion in the resonance state. These 'non-local cross sections' are compared with 'local cross sections' (obtained with the so-called boomerang model). It is shown that the two types of cross sections may differ from each other and that non-local cross sections are needed to unfold accurately the vibrational populations from experimental spectra. (22 refs.)

75435 Theoretical photoelectron spectroscopy of the nitrite ion. R.J.Harrison, N.C.Handy (Univ. Chem. Lab., Univ. of Cambridge, Cambridge, England).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.410-12 (27 May 1983).

In the accompanying paper by Ballard et al. (1982) vertical ionisation energies of NO_2^- have been observed at 8.6 and 7.0 eV, from the photoelectron spectra of salts in adiponitrile. Large-scale configuration interaction calculations are reported on the ground and excited states of NO_2^- and NO_2 . The first three vertical ionisation energies are calculated to be 2.5, 3.9 and 4.0 eV. (15 refs.)

75436 He(I) photoelectron and UV/visible absorption spectra of N_3^- , NO_2^- and NO_3^- in solution. R.E.Ballard, J.Jones, E.Sutherland, Chun Bae Lee (School of Chemical Sci., Univ. of East Anglia, Norwich, England).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.413-18 (27 May 1983).

The He(I) photoelectron spectra have been measured of tetra-N-butylammonium salts of N_3^- , NO_2^- and NO_3^- in adiponitrile solution; there are peaks or shoulders for N_3^- at 6.9 eV (π_g^-), for NO_2^- at 7.0 eV ($6a_1^-$) and 8.6 eV ($4b_2^-$), and for NO_3^- at ≈ 8.0 eV ($1a_2^-$) and ≈ 9.0 eV. Also measured are energies of electron-transfer processes in solution, such as $N_3^- + N\text{-methylpyridinium}^+ \rightarrow N_3 + N\text{-methylpyridinium}$. Analysis of the results enables the distinction to be made between electron transfer and internal transitions, e.g. the near UV absorption bands of N_3^- in solution, of controversial assignment, are undoubtedly due to electron transfer to solvent. (30 refs.)

75437 Photoelectron spectra of anions in solutions and the ionisation energy of the solvated electron. R.E.Ballard, J.Jones, E.Sutherland, Chun Bae Lee (School of Chem. Sci., Univ. of East Anglia, Norwich, England).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.419-21 (27 May 1983).

The ionisation energy of the solvated electron in water and acetonitrile is calculated to be 1.73 (0.3) eV, this value being the mean difference between the vertical ionisation energy and $h\nu(\max)$ for the electron-transfer-to-solvent band of seven anions in solution. (21 refs.)

75438 Application of photoelectron spectroscopy to biologically active molecules and their constituent parts. IX. 1,4-benzodiazepin-2-ones. L.Klasinc, B.Ruscic, A.Sabljic, N.Trinajstic (Rugjer Boskovic Inst., Zagreb, Yugoslavia).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1667-76 (April 1983).

For pt.VIII see Int. J. Quantum Chem., Quantum Biol. Symp. vol.7, p.403. The HeI photoelectron (PE) spectra of desmethyldiazepam, diazepam, oxazepam, temazepam, 3-(S)-methyldesmethyldiazepam, 3-(S)-methyldiazepam, 5-methyl-2H-1,4-benzodiazepin-2-one, and benzo-phenothymine have been measured and analyzed. Their low-energy regions (up to 12.0 eV) have been completely assigned by the composite molecule method using the PE spectra of diphenylmethane, benzophenonemethylimine, acetamide, chlorobenzene, and acetophenonemethylimine to compare the electronic structure of equivalent parts. (38 refs.)

75439 Photoelectron spectroscopy of NHO^- and DNO^- . H.B.Ellis, Jr., G.B.Ellison (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6541-58 (1 June 1983).

The authors obtained the photoelectron spectra of HNO^- and DNO^- using a recently constructed negative ion photoelectron spectrometer. They observe detachment to three different electronic states of HNO and DNO , namely the X^1A' , \bar{a}^2A' , and A^4A' states. The electron affinity of HNO is determined to be 0.338 ± 0.015 eV while that of DNO is 0.330 ± 0.015 eV. The \bar{a}^2A' state, which has not been observed directly before, is found to lie 0.778 ± 0.020 eV above the X^1A' state in HNO and 0.785 ± 0.020 eV in DNO . The authors see vibrational excitation up to $v_2=3$ of the $\nu_2(N-O)$ stretch) HNO and DNO X^1A' state. In the \bar{a}^2A' and A^4A' states, they see excitation of both ν_2 and $\nu_3(H-N-O)$ bend modes. The fundamental frequencies for the \bar{a}^2A' state are $\nu_2=1468 \pm 140$ cm^{-1} and $\nu_3=992 \pm 150$ cm^{-1} for HNO and $\nu_2=1452 \pm 140$ cm^{-1} and $\nu_3=750 \pm 140$ cm^{-1} for DNO . Analysis of transitions from vibrationally excited ions gives a ν_2 fundamental frequency of 1153 ± 170 cm^{-1} in HNO^- and 1113 ± 170 cm^{-1} in DNO^- . A study of the angular distribution of the photodetached electrons yields the values of β , the anisotropy parameter, for the various transitions in the spectrum. A Franck-Condon factor analysis of the HNO X^1A' band results in an estimate of the N-O bond length in the negative ion of 1.33 ± 0.02 Å. (62 refs.)

75440 Photoelectron spectra of adsorbed carbonates. M.A.Bartea, R.J.Madix (Dept. of Chem. Engng., Stanford Univ., Stanford, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.2, p.101-8 (May 1983).

In order to provide photoelectron spectra for analytical purposes, X-ray and ultraviolet photoelectron spectra for known surface species have been measured. The surface carbonate on Ag(110), formed by reacting gaseous CO_2 with pre-adsorbed atomic oxygen, yields C 1s and O 1s peaks at 287.7 and 529.9 eV, respectively. The UPS results show features due to surface CO_3 which scale well with those for bulk carbonates. These observations, coupled with the increase in work function that accompanies carbonate formation, suggest strongly that this surface species is negatively charged. (13 refs.)

75441 X-ray and UV photoelectron-spectroscopic studies of pyridine adsorbed on evaporated nickel and palladium in the temperature range 140-385K. Y.Inoue, K.Kishi, S.Ikeda (Dept. of Chem., Osaka Univ., Osaka, Japan).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.2, p.109-21 (May 1983).

The states of pyridine adsorbed on evaporated nickel and palladium films have been investigated as a function of temperature in the range 140-385K by means of X-ray and UV photoelectron spectroscopy. At $\sim 140K$, pyridine 'N-bonded' on the metal surfaces gives C 1s and N 1s peaks whose binding

energies are very close to those for condensed pyridine and 'N-bonded' pyridine on pre-oxidized nickel. The high-lying valence orbitals, $2b_1$ (π) and $1a_2$ (π) + $7a_1$ (π), of pyridine show shifts similar to those for the 'N-bonded' molecule on pre-oxidized nickel. At $\sim 290K$, π -bonded pyridine shows large shifts in the C 1s and N 1s peaks and in the high-lying valence orbitals, as observed for π -bonded benzene on nickel. The assignments of the adsorbed states are supported by work-function change data. A large proportion of pyridine converts from the 'N-bonded' to the π -bonded form between 220 and 290K. Formation of α -pyridyl is suggested at $\sim 375K$ on nickel. (22 refs.)

75442 Ionisation of cyanate ions in solution. R.E.Ballard, J.Jones, E.Sutherland (School of Chem. Sci., Univ. of East Anglia, Norwich, England).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.2, p.145-50 (May 1983).

The He(I) photoelectron spectra of the ions OCN^- and SCN^- in adiponitrile solution have sharp bands peaking at 8.3 and 7.1 eV. In acetonitrile solution, the N-methylpyridinium salts possess UV/visible absorption bands at 4.16 (OCN^-), 3.64 (SCN^-) and 3.37 eV (SCN^-); these are assigned as electron transfers from anion to cation. The conclusion is drawn that the near-UV absorption bands of the anions are caused by electron transfers to the solvent. (22 refs.)

75443 He(I)/He(II) photoelectron band intensity ratios for simple organic molecules. P.H.Cannington, N.S.Ham (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.31, no.2, p.175-9 (May 1983).

Band intensities in the He(I) and He(II) photoelectron spectra of some simple organic molecules (methanol, methylamine, formaldehyde, acetaldehyde, formic acid, acetic acid, methyl formate, ethylene, butadiene and methyl isothiocyanate) have been measured. The relative band intensity ratios for a number of ionizations from n and π orbitals are presented. (14 refs.)

75444 Study of the ionization process $BF^+(X^2\Sigma^+) \leftarrow BF(X^1\Sigma^+)$ by high-temperature photoelectron spectroscopy. J.M.Dyke, C.Kirby, A.Morris (Dept. of Chem., Univ. of Southampton, Southampton, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.3, p.483-90 (March 1983).

The He I photoelectron spectrum of the BF molecule, produced by passing BF_3 over heated boron, has been recorded. Only one band was observed and it was assigned to the ionization $BF^+(X^2\Sigma^+) \leftarrow BF(X^1\Sigma^+)$. For this band the adiabatic and vertical ionization potentials were coincident at 11.12 ± 0.01 eV and analysis of the observed vibrational structure gave $\omega_e = 1765 \pm 20$ cm^{-1} and $r_e = 1.208 \pm 0.005$ Å for the $BF^+(X^2\Sigma^+)$ state. Estimates of the first and higher vertical ionization potentials of BF are made by ab initio ΔSCF and Hartree-Fock-Slater calculations. (38 refs.)

75445 Photoelectron spectra of acenes. Electronic structure and substituent effects. L.Klasinc, B.Kovac (Rudjer Boskovic Inst., Zagreb, Croatia, Yugoslavia), H.Gusten.

Pure & Appl. Chem. (GB), vol.55, no.2, p.289-98 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

The valence-electronic structure of the first three members of the acene series, benzene, naphthalene and anthracene, is confirmed by their photoelectron (PE) spectra. This especially held for the π -ionizations which, according to their specific behaviour, could be assigned to different ionization modes. The vibrational fine structure of the observed systems is discussed. The effects of a series of substituents on the electronic structure of the parent molecules were traced in their PE spectra and compared. The results for methyl, chloro, methoxy and cyano substitution are described in detail. (31 refs.)

75446 The Cooper minimum in Cl_2 . T.A.Carlson, M.O.Krause (Chem. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), F.A.Grimm, T.A.Whitley.

Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.8-9.

Angle-resolved photoelectron spectroscopy using synchrotron radiation has been carried out on gaseous chlorine as a function of photon energy from 18 eV to 70 eV. From these data the partial cross sections and angular distribution parameter β have been derived for the first three orbitals. For the lone pair orbitals $2\pi_g$ and $2\pi_u$, distinct minima are found in both the partial cross sections and β values in the region of photoelectron energies from 30 to 40 eV. Less well-defined minima are also seen in the case of photoionization for the non-lone pair orbital, $5\sigma_g$. These features are believed related to the Cooper minimum that arises from an atomic 3p subshell. Calculations have also been carried out on the partial cross sections and β values using the multiple scattering $X\alpha$ method. Excellent agreement is obtained between experiment and theory. (no refs.)

75447 Excitation energy dependence in the photoemission satellite structures of CO and N_2 . W.Eberhardt, H.-J.Freund (Brookhaven Nat. Lab., Upton, NY, USA).

Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.13-14.

The photoemission spectrum of gaseous CO and N_2 is well known to exhibit structure which are not explainable in the independent particle picture of photoemission. These satellite lines correspond to ejection of a photoelectron with simultaneous electronic excitation of the remaining ion. The energetic distance of the satellite to the 'main' photoemission line reflects the ionic excitation energy. In principle it is now possible, based on energy and intensity, to assign the observed shake-up peaks to excited ionic configurations. In practice however this task becomes almost impossible; at least for higher energy states where many excited ionic states are almost degenerate in energy. The authors use the relative intensity of photoemission satellites in the outer core, inner valence region measured as a function of photon energy to identify the main contribution or parentage for each individual satellite. 33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

75448 Thermal broadening of optical homogeneous linewidths in organic glasses and polymers studied via photochemical hole-burning. H.P.H.Thijssen, R.Van Den Berg, S.Volker (Gorlaeus & Huygens Labs, Univ. of Leyden, Leyden, Netherlands).

Chem. Phys. Lett. (Netherlands), vol.97, no.3, p.295-302 (20 May 1983). Photochemical hole-burning was used to study optical dephasing in the $S_1 \rightarrow S_0$ transitions of dimethyl-s-tetrazine, chlorin and free-base porphyrin in several organic glasses and polymers. The homogeneous width (Γ_{hom}) seems to follow a $T^{-1.3 \pm 0.1}$ law between 0.4 and 20 K for all guest-host pairs, and extrapolates the lifetime-limited values of each guest for $T \rightarrow 0$. For a given temperature, Γ_{hom} appears to be related to the number of OH groups in the glass, and to the size of side-groups on the polymer chain. (32 refs.)

75449 Electronic spectral study of praseodymium(III) complexes with cysteine and diols. A.Kothari, S.N.Misra, M.P.Bhutra (Dept. of Chem., Univ. of Jodhpur, Jodhpur, India).

Indian J. Pure & Appl. Phys., vol.21, no.2, p.127-9 (Feb. 1983). The electronic spectra of the complexes of praseodymium(III) with cysteine and diols have been studied and the values of Slater-Condon (F_2), Lande spin-orbit interaction (ζ_d), oscillator strength (P) and Judd-Ofelt intensity parameter (T_2) have been calculated. The calculated values of the nephelauxetic ratio β and bonding parameter $b^{1/2}$ suggest covalent character of these complexes. (11 refs.)

75450 Stark-tuned Lamb-dip spectroscopy of the ν_4 and $2\nu_2$ bands of $^{14}\text{NH}_3$. W.H.Weber, R.W.Terhune (Ford Motor Co., Dearborn, MI, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6422-36 (1 June 1983). Results are presented of Stark-tuned Lamb-dip measurements in the $6 \mu\text{m}$ ν_4 and $2\nu_2$ bands of $^{14}\text{NH}_3$ obtained using an isotopic CO laser with an intracavity Stark cell. Some 230 lines from the isotopes $^{12}\text{C}^{16}\text{O}$, $^{13}\text{C}^{16}\text{O}$, $^{12}\text{C}^{18}\text{O}$, and $^{13}\text{C}^{18}\text{O}$ were investigated with fields up to 30 kV/cm. 71 coincidences with Stark-tuned NH_3 lines, involving several hundred Lamb dips, were assigned and analyzed. The positions of these lines relative to the CO laser lines are reported with a typical accuracy of 5-20 MHz. Model calculations of Lamb-dip spectra are also given that include power and pressure broadening and the collisionally transferred resonances. These are directly compared with observed spectra, from which the authors deduce values for the pressure broadening coefficients and the collisional transfer efficiency. Nuclear hyperfine structure is resolved on several lines, and from fitting one of these the authors obtained the value $eqQ = -4.83 \pm 0.3$ MHz for the nuclear quadrupole coupling constant in the $s2\nu_2$ ($J=10$, $K=9$) state. The authors see numerous examples of weak 'forbidden' transitions $\Delta M_J = 0, \pm 2$. These arise from the nuclear quadrupole coupling, which mixes M_J states. (40 refs.)

75451 Oscillator strengths corresponding to hypersensitive transitions of Nd^{3+} , Ho^{3+} , and Er^{3+} ions in solutions of complexes with certain amino polycarboxylic acids and their relation to the polarizability of the molecule. S.V.Bel'tyukova, N.S.Poluektov, T.B.Kravchenko, N.A.Nazarenko. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.937-40 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.272-5 (Aug. 1982). [received: April 1983]

The intensity of the absorption bands corresponding to hypersensitive transitions of lanthanide ions in solutions of complexes with amino polycarboxylic acids is shown to be directly proportional to the polarizability of the residue of the ligand molecules coordinated with the lanthanide ion. In the case of ligands containing the o-hydroxyphenyl or hydroxynaphthalene residue, whose oxygen atom is coordinated with the lanthanide ion, the values of oscillator strengths corresponding to hypersensitive transitions are proportionally related to the polarizability of the residue to the whole ligand molecule. (14 refs.)

75452 Exact solution of the Dirac-Coulomb equation and its application to bound-state problems. II. Interaction with radiation. M.K.F.Wong (Dept. of Math., Fairfield Univ., Fairfield, CT, USA), Hsin-Yang Yeh. *Phys. Rev. A (USA)*, vol.27, no.5, p.2305-10 (May 1983). For pt.1, see *ibid.*, vol.27, no.5, p.2300 (1983). An exact treatment of relativistically bound electrons in hydrogenlike atoms interacting with radiation is given. The simplified solution of the Dirac-Coulomb equation obtained by Wong and Yeh (1982) is used in the calculation. Transition probabilities and sum rules are obtained. The authors' results can be readily compared with those of the Pauli approximation, and all correction terms can be identified. New sum rules have been obtained for the relativistic case which can be compared side by side with the corresponding ones in the nonrelativistic case. (7 refs.)

75453 Breakdown of dynamic equilibrium between the symmetric and deformation mode levels in CO_2 caused by excitation in an electrical discharge. I.M.Bertel', V.O.Petukhov, A.S.Solodukhin, S.A.Trushin, V.V.Churakov (Phys. Inst., Acad. of Sci., Minsk, Belorussian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1429-30 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2317-19 (Nov. 1982). [received: May 1983]

Theories predicting the relative populations of low-lying levels in CO_2 molecules during excitation in an electric discharge are based on the assumption that dynamic equilibrium holds between and within the symmetric ν_1 and deformation ν_2 mode levels. The authors report experimental results which show that dynamic equilibrium may not hold between the group 01^0 , 02^0 , and 03^0 and the remaining levels for these modes when CO_2 molecules are excited in either a pulse or a steady-state electrical discharge. The authors reached this conclusion by analyzing the populations of the 10^0 , 02^0 , 01^0 , and 00^1 levels. The effective vibrational temperatures corresponding to the relative population of the levels 10^0 (T_1), 01^0 (T_2), 02^0 (T_2), and 00^1 (T_3) in CO_2 were determined by measuring the ratios K_i of the gains of a weak signal corresponding to individual vibrational-rotational lines in the 00^1 - 10^0 ($i=1$), 00^1 - 02^0 ($i=2$), 00^1 - 10^1 ($i=3$), and 01^0 - 11^0 ($i=4$) bands. In finding the temperatures, it was assumed that the levels 10^0 and 02^0 , which are coupled by a Fermi resonance, are in dynamic equilibrium. (5 refs.)

75454 Angular distribution of Xe 5s- σp photoelectrons: a sensitive test of theory. H.Derenbach, V.Schmidt (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany).

J. Phys. B (GB), vol.16, no.11, p.L337-42 (14 June 1983). The angular asymmetry parameter β for 5s photoionisation in xenon has been measured in the energy range where the relativistic random-phase approximation (RPPA) including 5s, 5p and 4d interchannel couplings predicts a strong deviation from the nonrelativistic value of two. The authors' data clearly show a deviation from the value two but not as pronounced as predicted by the RPPA calculation. This indicates that the theory has to be further improved in this case. 75456 Observation of the $1^2\Pi_u \leftarrow X^2\Sigma_u^+$ system in Cs_2^+ . H.Helm, P.C.Cosby, D.L.Huestis (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6451-4 (1 June 1983). Predissociation of vibrational levels in the $1^2\Pi_u$ state of Cs_2^+ has been observed by monitoring Cs^+ photofragments resulting from absorption of laser radiation by the $X^2\Sigma_u^+$ ground state. Predissociation of the $1^2\Pi_u$ state is induced by interaction with the repulsive $1^2\Sigma_u^+$ state and leads to the production of photofragments $\text{Cs}^+ + \text{Cs}$ in their ground electronic state with center-of-mass separation energies around 1 eV. The dominant features of the $1^2\Pi_u \leftarrow X^2\Sigma_u^+$ band system are confined to the wavelength range between 7700 and 8700 Å. A lower limit for the bond energy of the $1^2\Pi_u$ state, measured relative to its dissociation limit $\text{Cs}^+(^1S_0) + \text{Cs}(^2P_{1/2})$ is found to be 0.39 ± 0.1 eV. The spin-orbit splitting in the $1^2\Pi_u$ state is measured to be 280 cm^{-1} . (13 refs.)

75457 New predissociations in GeH affecting all the $A^2\Delta$ state levels. P.Erman, O.Gustafsson, M.Larsson (Phys. Dept. Royal Inst. of Technol., Stockholm, Sweden).

Phys. Scr. (Sweden), vol.27, no.4, p.256-60 (April 1983). Lifetimes have been measured of the rotational levels $N'=2-18$ of the $\text{GeH } A^2\Delta \leftarrow X^2\Pi (0,0)$ band yielding results in the range 75-85 ns. These are much shorter values than the authors had found earlier for the radiative lifetimes of

the same system in the analogous molecules CH and SiH (≈ 500 ns) suggesting that all α -state levels in GeH are subjected to predissociations in the same way as in CH and SiH, i.e. through direct interactions with the continuum of the ground state. This conclusion is also supported by *ab initio* calculations which give a lower limit of 200 ns for the radiative lifetime of the GeH α state. (19 refs.)

75458 Two-photon excitation spectroscopy of phenanthrene singlet states below 50000 cm^{-1} . B.Dick, G.Hohlneicher (Lehrstuhl für Theoretische Chem., Univ. zu Köln, Cologne, Germany).

Chem. Phys. Lett. (Netherlands), vol.97, no.3, p.324-30 (20 May 1983). The two-photon excitation spectrum of phenanthrene in liquid solution is reported in the energy range $29000\text{--}49000\text{ cm}^{-1}$. Comparison with the one-photon spectrum and extended CNDO/S calculations allows assignment of eight singlet states. The strongest two-photon band is assigned to the B_0 state not seen directly in the UV spectrum. This high intensity and other features of the spectrum are in sharp contrast to the pairing selection rules which forbid two-photon transitions to 'plus' states in alternant hydrocarbons. (45 refs.)

75459 Two-frequency multiphoton absorption in UF_6 . G.Koren (Phys. Dept., Technion, Israel Inst. of Technol., Haifa, Israel).

J. Appl. Phys. (USA), vol.54, no.5, p.2827-9 (May 1983). The multiphoton absorption of $9.3\text{-}\mu\text{m}$ CO_2 laser radiation induced by multiphoton absorption of $16\text{-}\mu\text{m}$ CF_4 laser radiation in UF_6 is reported. An average vibrational energy deposition in the range of 1 to 2.8 eV per molecule is found, which is sufficient to cause the observed dissociation either by collision-assisted or unimolecular decomposition processes. (9 refs.)

75460 A theory of visible/UV multiphoton processes in molecules. I. Resonance effect on three-photon absorption. Y.Fujimura (Dept. of Chem., Faculty of Sci., Tohoku Univ., Sendai, Japan), S.H.Lin.

J. Chem. Phys. (USA), vol.78, no.11, p.6468-76 (1 June 1983). Using a transition operator formalism, an expression for three-photon transitions is derived. The transition operator formalism makes it possible to take into account the effects of population decays and pure dephasings occurring in the relevant vibronic states on the cross sections of the resonance multiphoton processes. It is shown that for a two-photon resonant ($2+1$) process, the cross section can approximately be divided into two terms; one is called sequential term which cannot be taken into account by using the lowest order time-dependent perturbation theory, and the other which can be derived from simultaneous three-photon cross section under constraint of a resonant condition for the second photon absorption. Assuming the adiabatic approximation for the molecular states, analytical expressions for the cross sections for the three-photon absorptions are derived in the displaced harmonic oscillator model of the molecules. An analytical expression taking into account the temperature effect is given for the simultaneous three-photon absorption cross section. (18 refs.)

75461 New experimental information from two-photon spectroscopy and comparison with theory. G.Hohlneicher, B.Dick (Lehrstuhl für Theoretische Chem., Univ. zu Köln, Köln, Germany).

Pure & Appl. Chem. (GB), vol.55, no.2, p.261-8 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).

From a specially designed experiment, allowing the measurement of two-photon absorption spectra and two-photon polarization parameters over a wide spectral range new experimental information is obtained on the location of electronically excited states usually not seen in the UV-spectrum. By comparison with theory it is shown that in most of the examples investigated the ordering of the low lying excited states is different from what is usually expected. Correlation strongly influences the ordering especially in those systems which consist of loosely coupled π -systems. (31 refs.)

75462 Semiclassical theory for diatom-diatom collisions. G.D.Billing (Panum Inst., Univ. of Copenhagen, Copenhagen, Denmark).

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.188-92 (13 May 1983). A semiclassical approach to diatom-diatom collisions is presented. The method involves a classical treatment of the translational and rotational motion of both molecules. The vibrational degrees of freedom are quantized using a Monte oscillator approximation. The method is used to evaluate the accuracy of previous calculations based upon the energy-corrected harmonic-oscillator approach. (13 refs.)

75463 A unified algebraic approach to bound and continuum states of anharmonic potentials. C.E.Wulfman, R.D.Levine (Fritz Habere Molecular Dynamics Res. Center, Hebrew Univ., Jerusalem, Israel).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.361-4 (27 May 1983). A general procedure for an algebraic formulation of the eigenvalue problem for hamiltonians which have both a discrete and a continuum spectrum is introduced. The one-dimensional Morse potential is used as an example, but more complex types of spectra can also be handled. (12 refs.)

75464 Calculation of van der Waals co-efficients in alkaline-earth chalcogenides. A.K.Kapur (Dept. of Phys., V.S.S.D. Coll., Kanpur, India), J.K.Jain.

Indian J. Theor. Phys., vol.29, no.3, p.291-8 (Sept. 1981). The van der Waals dipole-dipole and dipole-quadrupole interaction coefficients in alkaline-earth chalcogenides crystals have been estimated using the appropriate values of the crystalline state electronic polarizabilities of the ions obtained by using the polarizability radius cube relation. These values of electronic polarizabilities are in close agreement with the experimental values of Tessmann et al. (1953). Appropriate values of the effective number of electrons in the ion necessary to account for the actual polarizability of the ion have been used in these calculations. (16 refs.)

75465 Molecular electrostatic potential of a triple stranded helix: poly(dT).poly(dA).poly(dT). S.Corbin, R.Lavery, B.Pullman (Lab. de Biochimie Théorique, Inst. de Biologie Phys.-Chimique, Paris, France).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1451-61 (April 1983). The molecular electrostatic potential of the triple helix poly(dT).poly(dA).poly(dT) is calculated, and the results are examined in relation to those obtained for its component double and single helical parts. For the double helix presenting the standard Watson-Crick hydrogen bonds, the deepest potentials are formed on the side of the major groove, a situation similar to that observed in the A-DNA duplex. For the double helix presenting Hoogsteen-type hydrogen bonds the deepest potentials lie in the major groove, on the side of the pyrimidine strand. In the triple helix the deepest potentials are located in the major groove in a narrow zone over the thymine bases of the Watson-Crick pair. (13 refs.)

75466 Induction and dispersion energies including charge overlap effects: Green's-function-type methods. P.Claverie (Lab. de Chimie Quantique, Inst. de Biologie Phys.-Chimique, Paris, France).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1687-8 (April 1983). The evaluation of intermolecular interaction energies may now be based with sufficient accuracy upon the first and second order terms common to the exchange perturbation treatments symmetrized Rayleigh-Schrodinger (SRS), Murrell-Shaw and Musher-Amos (MSMA), Jezorski-Kolos (KJ). The author considers the Rayleigh-Schrodinger terms, namely, induction and dispersion, since the second-order exchange terms appear relatively much less important than the first-order exchange term. In contradistinction with the situation encountered for the electrostatic term, the multipolar expansion is now divergent, making it impossible to define a long range 'exact multipolar part' and a short-range 'penetration part' (which would have represented the so-called 'charge overlap effect'). He deals with the problem of representing the induction and dispersion terms directly without introducing any multipolar expansion of the matrix elements involving the interaction operator V . (23 refs.)

75467 An RKR-like inversion procedure for bound-continuum transition intensities. M.S.Child, H.Essen, R.J.Le Roy (Dept. of Theoretical Chem., Univ. of Oxford, Oxford, England).

J. Chem. Phys. (USA), vol.78, no.11, p.6732-40 (1 June 1983). A semiclassical RKR-like inversion procedure for determining a repulsive diatomic molecule potential energy curve from structured bound-continuum transition intensity data is derived and tested. The method presumes a knowledge of the (attractive), initial state potential well and of the energy and vibrational assignment of the absorbing or emitting level. Its application to a structured emission continuum of NaK observed by Breford and Engelke (*Chem. Phys. Lett.* 53, 282, 1979) yields a potential energy curve which is incompatible with other known properties of this system, a result which confirms the suggestion of Kato and Noda (*J. Chem. Phys.* 73, 4940, 1980) that the original assignment of the initial state for this spectrum is in error. (35 refs.)

75468 Semiclassical representation method in statistical physics of interacting molecules. I. General theory. E.P.Gordov, S.D.Tvorogov (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).

Physica A (Netherlands), vol.119A, no.1-2, p.339-55 (April 1983). The description of the method of transition from the quantum-statistical theory of interacting subsystems to a semi-classical one is given, using interacting molecules as an example. The kinetic equation for the distribution function of the classical subsystem, i.e. a translational motion of molecules which interacts with a quantum subsystem, namely, the internal motions of the molecules, is derived. The physical interpretation of the classical intermolecular potential and the origin of irreversibility of translational motion of molecules are discussed. (15 refs.)

34.40 ELASTIC SCATTERING OF ATOMS AND MOLECULES

- 75469 An extended corresponding states model for the elastic collision rate in a real gas. J.W.Root, D.Bookin (Dept. of Chem., Univ. of California, Davis, CA, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.4-5, p.392-6 (27 May 1983).
 An extended corresponding states kinetic theory is proposed for the estimation of elastic collision rates in real gases under equilibrium conditions. The collision rates are obtained by combining the $\Omega^{(1,0)}$ reduced collision integral with the hard-sphere kinetic model. (14 refs.)
 Absolute determination of the differential elastic cross section and total inelastic cross sections for the collision He^+-He between 3 and 50 keV and between 0.25 and 3 degrees. Elaboration of a simple theoretical model See Entry 75475

34.50 INELASTIC SCATTERING OF ATOMS AND MOLECULES

- 75470 *M* dependence in rotationally inelastic collisions in cell experiments: implications of an irreducible tensor expansion for molecules in Σ electronic states. M.H.Alexander (Dept. of Chem., Univ. of Maryland, College Park, MD, USA), S.L.Davis. *J. Chem. Phys. (USA)*, vol.78, no.11, p.6754-62 (1 June 1983).
 The tensorial coupling of initial and final angular momenta, commonly used in atomic collisions and attributed to Grawert (1969), is here applied to *M* dependent collisions of molecules in Σ electronic states under conditions where the relative velocity vectors of the collision partners are uniformly distributed with respect to a laboratory fixed *z* axis. The integral inelastic cross sections are given by sums over tensor opacities, weighted by squares of vector coupling coefficients. The resulting expressions differ from those obtained within the tensorial treatment usually applied to molecular collisions. One can rigorously show that strict *M* conservation will not occur and, furthermore, that the complete matrix of $M \rightarrow M'$ cross sections can be related to the smaller set of tensor opacities. In the energy sudden limit the $JM \rightarrow JM'$ cross sections can be related to the degeneracy-averaged $J'' \rightarrow J'$ cross sections. Accurate close-coupling cross sections for the He- CO system due to Green are used to obtain the relevant tensor opacities and to demonstrate how degeneracy averaged $J'' \rightarrow J'$ cross sections can be extracted from the fully resolved $JM \rightarrow JM'$ cross sections. Finally, the sudden scaling relation is used to analyze rotational relaxation in the $\text{Na}_2(\text{A}^2\Sigma_u^+)+\text{He}$ system. The authors show that θ conservation, where $\theta = \cos^{-1}(\hat{j}_2)$, is a more appropriate dynamical model than *M* conservation. (62 refs.)
 75471 Semiclassical decoupling schemes in molecular collisions. K.Sakimoto (Inst. of Space & Astronaut. Sci., Tokyo, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1563-71 (May 1983).
 Several decoupling schemes are discussed for the semiclassical impact parameter treatment of collisions between atoms and linear rigid rotors. First, a decoupling method analogous to the quantum mechanical one originating from the conservation of parity is found in the semiclassical treatment. Next, presently derived semiclassical versions of *l*-dominance and decoupled *l*-dominance approximations provide the author with an intuitive understanding of the physical meaning of these approximations. Numerical approximations are performed for the H^+-CO collision system. (18 refs.)
 75472 Fine-structure transitions in collisions of $\text{Kr}^+(\text{P})$ with rare gases. N.Kobayashi, T.Nakamura, Y.Kaneko (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1581-4 (May 1983).
 Fine-structure transitions, $j=3/2 \rightarrow 1/2$ and $1/2 \rightarrow 3/2$, in the collisions of $\text{Kr}^+(\text{P})$ with rare gases were studied with an ion energy-loss spectrometer in the energy range from 500 eV to 1300 eV. The ions were produced with an electron-impact type ion-source. The fractional ratios of $j=1/2$ to $j=3/2$ states, $N(1/2)/N(3/2)$, contained in the primary beam were determined as a function of the electron energy in the ion source from 20 eV to 150 eV. The values were almost constant above the electron energy of 40 eV, and the average value of 0.479 ± 0.002 which is close but not exactly equal to the statistical value, 0.5, was obtained. The cross sections for the fine-structure transitions in the collisions of Kr^+ with He were also obtained.
 75473 Semiclassical complex angular momentum analysis of low-energy H^+-He differential cross sections. K.-E.Thylwe (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany). *J. Phys. B (GB)*, vol.16, no.11, p.1915-30 (14 June 1983).
 A semiclassical complex angular momentum (CAM) description of low-energy elastic collisions is presented. The scattering amplitude is divided into two parts: the direct part is described by non-orbiting semiclassical trajectories, while the orbiting part is described by a small number of poles of the *S* matrix. The system H^+-He was studied in some detail. (31 refs.)
 75474 Collisional de-excitation of KrF^* excimer by simultaneous ionisation of excited neutrals. M.Matsuzawa, S.Kitaji (Dept. of Engng. Phys., Univ. of Electro-Communications, Tokyo, Japan). *J. Phys. B (GB)*, vol.16, no.11, p.1931-6 (14 June 1983).
 Dipole-dipole energy transfer is one of the major mechanisms in the collisional deexcitation of excimers by simultaneous ionisation of excited neutrals. Based on this mechanism, the cross sections for collisional de-excitation of KrF^* with several excited species are calculated to be 110-170 Å² at thermal energies. (20 refs.)
 75475 Absolute determination of the differential elastic cross section and total inelastic cross sections for the collision He^+-He between 3 and 50 keV and between 0.25 and 3 degrees. Elaboration of a simple theoretical model. D.Bordenave-Montesquieu, A.Boutonnet, C.Berges, R.Dagnac (Centre de Phys. Atomique, Univ. Paul Sabatier, Toulouse, France). *J. Phys. B (GB)*, vol.16, no.11, p.1937-55 (14 June 1983). In French.
 The authors studied, by energy loss spectrometry, the direct elastic and inelastic processes and measured their differential cross sections (DCS), with vary-

ing energy and scattering angle, for the He^+-He collision; the energies range from 3 to 50 keV (laboratory) and the scattering angles are varied from 0.25 to 3° (laboratory). To explain the elastic DCS behaviour, they elaborated a simple theoretical model which gives a good agreement with the experiment, chiefly at high energies. It also allows them to calibrate the experimental results and gives absolute values of the DCS. Further, by integration of the DCS over all scattering angles, they obtained total cross sections (TCS) for the inelastic processes. (17 refs.)

75476 Solution of the time-dependent Dirac equation by the finite difference method and application for $\text{Ca}^{20+}+\text{U}^{91+}$. U.Becker, N.Grun, W.Scheid (Inst. für Theoretische Phys., Justus-Leibig-Univ., Giessen, Germany). *J. Phys. B (GB)*, vol.16, no.11, p.1967-81 (14 June 1983).

The Dirac equation for an electron moving in time-dependent electromagnetic fields is solved by the method of finite differences. For simplicity the solution is restricted to problems with a rotational symmetry about an axis. The method is applied to the scattering of Cs^{20+} on a hydrogen-like U^{91+} ion at relativistic incident energies. Excitation and ionisation probabilities and the K-shell vacancy production probability are calculated. (27 refs.)

75477 Ionic-covalent problem in the $\text{H}^++\text{H}^+ \rightleftharpoons \text{H}^+\text{H}^+$ collisional system. V.Sidis, C.Kubach (Lab. des Collisions Atomiques et Moléculaires, Univ. de Paris-Sud, Orsay, France), D.Fussen. *Phys. Rev. A (USA)*, vol.27, no.5, p.2431-46 (May 1983).

A detailed theoretical study of $\text{H}^++\text{H}^+ \rightleftharpoons \text{H}^+\text{H}^+$ collisions in the $0.02 < E_{\text{cm}} < 10$ keV energy range is reported. Calculations of the relevant states of the quasimolecular system are carried out at large internuclear distances ($5a_0 < R < 100a_0$) with a model involving only the loosely bound electron of the system. The authors calculated adiabatic states agree well with the available accurate ab initio results. Diabatic states are found not only to differ from the conventionally invoked pure ionic and covalent states, but also to depend dramatically on the choice of the fixed electron coordinate origin. Such differences show up in the cross-section calculations when $\text{H}^*(n=3)+\text{H}$ channels are taken into account and demonstrate the need for considering the problem of the electron translation factor. Cross-section calculations are finally calculated in a 12-state projected valence-bond diabatic basis incorporating a common translation factor of the Schneiderman-Russek type. The results demonstrate the important contribution of $\text{H}^*(n=3)+\text{H}$ channels to the mutual neutralization process. Good agreement is obtained with the experimental data on neutralization and detachment in H^++H^+ and on H^+ formation in $\text{H}^*(s)+\text{H}$, for collision energies $E_{\text{cm}} \geq 200$ eV. At lower energies no explanation of the structures and magnitude of the experimental neutralization cross section is found. (57 refs.)

75478 A study of adiabaticity in the case of target degeneracy. E.R.A.Segre (Dept. de Física do Inst. Tecnol. de Aeronautica, Centro Tecnico Aeronautico, Sao Jose dos Campos, Brazil). *Rev. Bras. Fis. (Brazil)*, vol.12, p.115-22 (March 1982). In Portuguese. [received: April 1983]

The validity of the adiabatic approximation in the case of the collision of a semi-classical charged projectile and a target atom in a degenerate state is examined. The target is hydrogen atom in the first excited state, which allows calculations to be performed analytically, within the dipolar interaction and 'no-quenching' assumptions. It is confirmed, in a precisely quantitative way, that the adiabatic approximation breaks down for impact parameters larger than the Weisskopf radius, and the exact wave function describing the collision is given. (7 refs.)

75479 Stosse laserangeregter Atome zur Potentialbestimmung für die Systeme K (4S₀2P)-Ne, Ar, Kr, Xe (Laser-stimulated atomic collisions for potential determination for the system K (4S₀2P)-Ne, Ar, Kr, Xe). H.Tischer.

Report 16/1982, Max-Planck-Inst. Stromungsforschung, Gottingen, Germany (Dec. 1982), 89 pp. In German.

Gives the results and evaluations of total differential distributed cross section measurements for $\text{K}(4\text{P}_{3/2})-\text{Ar}$, Kr , Xe , Ne systems at thermal collision energies. First an introduction is given, then the theory behind the experiment is explained. The apparatus is described. Finally, the measurements are made for each system and these are described. (49 refs.)

75480 Messung feinstrukturauflösender differentieller Streuquerschnitte für Stosse von Kalium an Quecksilber mittels teilchen-Photon-Koinzidenz (Measurement of fine structure perturbed differential scattering cross-sections for the collision of potassium and mercury by particle-photon coincidence). H.Hubner.

Report 15/1982, Max-Planck-Inst. Stromungsforschung, Gottingen, Germany (Dec. 1982), 89 pp. In German.

Describes an experiment which is a continuation of measurements made by Schädlich (1978), Strunck (1976) and Kracht, who measured the differential excitation cross sections for the dominant first resonance levels of alkali-mercury systems. First the author gives a general introduction to the experiment. The aim of the experiment is to determine the time structure cross sections for the potassium-mercury collision system. A fast potassium beam is crossed with a thermal quick-silver beam, and the dispersed particles collide with the emitted photons. The system is controlled by computers and the typical measurement times are between 5 and 70 hours per angle. The construction of the experimental apparatus is described in some detail followed by measurement and evaluation methods. The results of the measurements are given. (60 refs.)

75481 Feynman diagram for reactive collisions. B.C.Mishra (Dept. of Phys., RDW Coll., Bhubaneswar, India), T.Pradhan.

Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.77

On the basis of a quantum field theoretic formulation of atomic collision phenomena involving nonrelativistic free and bound systems developed by the authors, they have drawn the Feynman diagram for the reactive collisions between the alkali atoms and halogen molecules and have calculated the cross section for the production of alkali halide molecules. Their result shows an excellent agreement with the experimental observations.

34.50E Rotational and vibrational energy transfer

75482 Vibrational energy transfer in $\text{A}^{2\Sigma^+}$ OH in flames. G.P. Smith, D.R. Crosley (SRI Internat., Menlo Park, CA, USA). *Appl. Opt. (USA)*, vol.22, no.10, p.1428-30 (15 May 1983). Measurements have been made of the collisional vibrational energy transfer from $\nu=1$ to $\nu=0$ within the $\text{A}^{2\Sigma^+}$ electronically excited state of the OH molecule present in the burnt gases of a methane-air flame. The results show that the transfer rate decreases with increasing initial rotational quantum number N' in $\nu=1$. This has implications for laser-induced fluorescence thermometry and concentration measurements in flames and for the understanding of the formation of A-state OH in flame reactions. (9 refs.)

75483 Energy-dependent energy transfer: deactivation of azulene (S_0 , E_{vib}) by 17 collider gases. M.J. Rossi, J.R. Pladziec, J.R. Barker (Dept. of Chem. Kinetics, SRI Internat., Menlo Park, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6695-708 (1 June 1983). Collisional deactivation of highly vibrationally excited azulene in the electronic ground state was investigated using infrared fluorescence detection. Azulene (S_0 , E) was prepared with $E \approx 17500 \text{ cm}^{-1}$ and $E \approx 30600 \text{ cm}^{-1}$ by laser excitation at 600 and 337 nm, respectively. Advantage was taken of the fast integral conversion rate to S_0 azulene from $\text{S}_1(600 \text{ nm})$ and $\text{S}_2(337 \text{ nm})$ electronic states. The collider gases investigated are He, Ne, Ar, Kr, Xe, H_2 , D_2 , N_2 , CO , O_2 , CO_2 , H_2O , NH_3 , CH_4 , SF_6 , $n\text{-C}_4\text{H}_{10}$, and unexcited azulene. The results are expressed in terms of $\langle \Delta E(E) \rangle$, the average energy transferred per collision, which can depend on the vibrational excitation energy E of the azulene. Using previously obtained knowledge of the dependence of infrared fluorescence intensity on E (M.J. Rossi and J.R. Barker, *Chem. Phys. Lett.* 85, 21, 1982), two methods were used to obtain $\langle \Delta E(E) \rangle$ values from the fluorescence decay curves: (1) an approximate method that considered only the average energy, and (2) solution of the full collisional master equation. Both methods gave $\langle \Delta E(E) \rangle$ values that depend strongly on E . The limited experimental information on the identity of the energy-transfer processes operative in the deactivation of azulene is discussed. Additional experimental results on vibration-to-vibration energy transfer from azulene to CO_2 are presented, which indicate that the emission at $4.3 \mu\text{m}$ observed previously (J.R. Barker, M.J. Rossi, and J.R. Pladziec, *Chem. Phys. Lett.* 90, 99, 1982) originates not only from $\text{CO}_2(001)$, but from other states with one quantum of excitation in ν_3 . The experimental results are discussed in terms of models for energy transfer, which have appeared in the literature. It is concluded that only a superficial understanding exists and theory has lagged far behind experiments on energy transfer. (50 refs.)

75484 Collisional deactivation of vibrationally highly excited polyatomic molecules. II. Direct observations for excited toluene. H. Hippler, J. Troe, H.J. Wendelken (Inst. fur Phys. Chem., Univ. Gottingen, Gottingen, Germany). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6709-17 (1 June 1983). Vibrationally highly excited toluene molecules with 52000 cm^{-1} of vibrational energy have been prepared by UV laser excitation of the isomer cycloheptatriene and subsequent isomerization. The collisional loss of energy from the excited toluene molecules has been observed directly by monitoring hot UV absorption spectra. Direct measurements of the average energies (ΔE) transferred per collision have been made for about 60 different bath gases. For complex bath gases, $\langle \Delta E \rangle$ values appear to be considerably smaller than those derived from earlier indirect measurements. $\langle \Delta E \rangle$ was found not (or only slightly) to depend on the excitation energy. (31 refs.)

75485 Collisional deactivation of vibrationally highly excited polyatomic molecules. III. Direct observations for substituted cycloheptatrienes. H.J. Hippler, J. Troe, H.J. Wendelken (Inst. fur Phys. Chem., Univ. Gottingen, Gottingen, Germany). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6718-24 (1 June 1983). For pt.II see *ibid.*, vol.78, no.11, p.6709-17 (1983). Vibrationally highly excited ethyl-cycloheptatriene (41600 cm^{-1}) and isopropyl-cycloheptatriene (41800 cm^{-1}) molecules in the electronic ground state have been prepared by UV laser excitation inducing one-photon absorption and subsequent internal conversion. Collisional energy loss of these molecules has been followed directly by hot UV absorption spectroscopy. Average energies transferred per collision (ΔE) have been determined for a series of bath gases. $\langle \Delta E \rangle$ values were found, for a given bath gas, to increase very slightly with the size of the excited molecule. (31 refs.)

75486 Line displacement and line width in the binary collision theory of the vibrational phase relaxation. R. Ouilion (Dept. de Recherches Phys., Univ. Pierre et Marie Curie, Paris, France), V. Sergiescu, R. Tascou D'Leon. *Mol. Phys. (GB)*, vol.49, no.1, p.151-8 (May 1983). The authors present an elementary kinetic calculation of the displacement and width of a Raman line due to vibrational phase relaxation. The binary collision model is used and the relation between the two effects is stressed. The calculated values are compared with the experimental ones for gaseous (H_2/H_2 , H_2/He , H_2/Ar) and liquid (H_2/SF_6 , N_2/SF_6 , N_2/CCl_4) systems. A repulsive potential is used. (8 refs.)

75487 Streuquerschnitte für die Rotationsanregung von N_2 , O_2 und CH_4 durch Stöße mit He-Atomen (Scattering cross-section for the rotational excitation of N_2 , O_2 and CH_4 by collisions with the atoms). K.-H. Kohl. Report 17/1982, Max-Planck-Inst. Stromungsforschung, Gottingen, Germany (Dec. 1982), 116 pp. In German. Describes the experiment by first giving it an introduction, and the reasons behind the experiment. Measurement methods are given (principle construction of the scattering experiment, kinematics of the experiment and demands on the solution possibilities of the measurement apparatus) and then details of the measurement apparatus are given. Measurements results are given and graphs drawn where appropriate. An absolute total and inelastic differential effective cross section is evaluated, and finally the author presents a discussion. 34.50H Electronic excitation and ionization (inc. beam-foil excitation and ionization)

75488 Ionisation cross sections of Cd, Sn, Te, I and Ba for protons and alpha particles. L. Avaldi, M. Milazzo, G. Trivita (Istituto di Fisica Generale Applicata, Univ. degli Studi di Milano, Milano, Italy), I.V. Mitchell. *J. Phys. B (GB)*, vol.16, no.11, p.1957-65 (14 June 1983).

K-shell X-ray production cross sections of ^{48}Cd , ^{50}Sn , ^{52}Te , ^{53}I and ^{56}Ba have been measured for alpha particles with energies between 2.2 and 2.8 MeV. In addition, production cross sections for ^{52}Te have been measured for protons between 1.6 and 3 MeV. The values have been compared with the earlier experiments and with the theoretical predictions given by four different approaches: the perturbed stationary state model corrected for relativistic, projectile Coulomb deflection, and energy-loss effects, the plane-wave Born approximation (PWBA) with corrections for relativistic effects, effective binding and Coulomb deflection, the semiclassical approximation corrected for the same effects as the PWBA in its most recent formulation and, lastly, the binary model corrected for effective energy and relativistic effects. The different degrees of agreement for each theory in the cases examined are discussed. (27 refs.)

75489 Atomic excitation and ionization by slow magnetic monopoles. G. Tiktopoulos (Phys. Dept., Nat. Tech. Univ., Athens, Greece). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.156-60 (26 May 1983). Cross sections are calculated for transitions of atomic electrons induced by the close passage of very massive Dirac monopoles for monopole velocities small compared to the characteristic electron orbital velocity. (9 refs.)

75490 Detailed analysis of the scope of the modified Firsov model. S.A. Cruz, C. Vargas-Aburto (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), D.K. Brice, E.V. Alonso, D.G. Armour. *Phys. Rev. A (USA)*, vol.27, no.5, p.2403-20 (May 1983).

A detailed and systematic analysis of the scope of the Firsov model (1959) as modified by Cheshire (1969) when no adjustable parameters are included in the calculations of the low-velocity electronic-stopping cross section is presented. For this purpose the authors summarize and extend their previously reported [Radiat. Eff. Lett. 43, 79 (1979); Nucl. Instrum. Methods 170, 205 (1980)] preliminary results on the role of all computational degrees of freedom that influence the outcome of the calculations, namely, (a) inclusion of trajectory, (b) accuracy of wave functions and speed of atomic electrons, (c) motion of Firsov's plane, and (d) consideration of experimental conditions. The authors find that the Firsov theory is accurate only within a factor of 2; therefore, at least a scale factor is necessary in order to get reasonable agreement with experiment. (53 refs.)

75491 Quasielastic state-changing collisions of high-Rydberg atoms with rare-gas atoms*. K. Sasano, Y. Sato (Dept. of Engng. Phys., Univ. of Electro-Communications, Tokyo, Japan), M. Matsuzawa. *Phys. Rev. A (USA)*, vol.27, no.5, p.2421-30 (May 1983).

For $20 \leq n \leq 45$, two types of quasielastic state-changing-collisional (QESCC) processes, i.e., (i) l-changing and (ii) n- and l-changing processes, have been theoretically investigated based on the free-electron model in which an excited Rydberg electron behaves as if it were 'free' and slow with its interaction with a rare-gas atom playing a decisive role. It is shown that a parameter $u_{\text{min}} = \nu \Delta E a_0 / (hV)$ is quite useful for characterizing both of these QESCC processes in a unified way where $\nu (\approx \nu')$ is an effective principal quantum number of the initial (final) state, ΔE is an energy defect, and V is a relative velocity. It is theoretically found that higher-angular-momentum states are dominantly populated in the final channel of these QESCC processes with $1 < u_{\text{min}} \leq \nu$ such as in the n- and l-changing collision of $\text{Rb}^{**}(ns) + \text{He}$. This is in contrast with the uniform distribution over the final angular-momentum states for the usual l-changing processes, i.e., $u_{\text{min}} \leq 1$. The calculated cross sections of these QESCC processes with $1 < u_{\text{min}} \leq \nu$ are found to be in reasonable agreement with experimental findings available at present. (32 refs.)

75492 Semiclassical approach to trajectory effects on the anisotropy coefficient of L_3 -subshell X-rays induced by slow heavy particles collisions. E.C. Montenegro, A.C. De Pinho (Dept. de Fisica, PUC/RJ, Rio de Janeiro, Brazil). *Rev. Bras. Fis. (Brazil)*, vol.12, p.29-49 (March 1982). In Portuguese. [received: April 1983]

The deflection and the retardation of a slow bare heavy particle by the repulsive Coulomb field of the target nucleus are known to modify the ionization cross sections of inner shells. It is shown how to calculate these effects in the magnetic substates of the $2p$ -subshell in the frame of the impact parameter picture. These corrections are essential to understand the energy dependence of the anisotropy coefficient of X-rays emitted in transitions filling an L_3 -subshell vacancy produced by massive particle bombardment. (15 refs.)

75493 4f-ionization of atomic cerium. A. Bringer (Inst. fur Festkörperforschung, KFA Jülich, Jülich, Germany). *Solid State Commun. (USA)*, vol.46, no.8, p.591-3 (May 1983).

The binding of the 4f electron in a cerium atom is investigated for general shapes of the 4f wave function. There is no activation barrier for 4f-ionization, in contradiction to earlier calculation by Schluter and Varma (1982), who assumed a hydrogenic form. The existence of a second stationary electronic structure with extended 4f electrons and the 'bistability model' developed from it to explain spectroscopic data in Ce compounds can be ruled out on energetic grounds. (11 refs.)

75494 Transitions between excited states with mixed coupling $\text{Ne } 2p^4 4p$ N levels. V.M. Baran, G.L. Kononchuk, A.V. Yakunov. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.658-60 (May 1983). In Russian.

Effective cross-sections are discussed for transitions between the fine structure components of the neon $2p^4 4p$ group levels. The results are obtained by two-frequency laser sounding of a discharge plasma. The total deactivation cross-section of the $4p[3/2]_2$ state is in good agreement with results of other authors. A possible dependence on the degree of degeneracy is discussed for probability of transition between the fine structure components. (10 refs.)

75495 Experimental determination of the m_J distribution in inelastic scattering of Na_2 by He. M.A. Treffers, J. Korving (Huygens Lab., Rijksuniv., Leyden, Netherlands).

Chem. Phys. Lett. (Netherlands), vol.97, no.3, p.342-5 (20 May 1983). The orientational distribution of Na_2 molecules scattered by He has been determined in a molecular beam experiment. At large angle scattering, where inelastic collisions are dominant, a high degree of alignment has been observed. This alignment depends strongly on the rotational quantum number J after scattering. The J dependence can be explained by assuming that during collisions m_J is conserved when the quantization axis is chosen parallel with the geometric apse. (9 refs.)

34.70 CHARGE TRANSFER

(see also 82.30 Charge transfer reactions)

75496 Asymptotic theories of charge transfer at low energies. J.N. Bardsley (Univ. of Pittsburgh, Pittsburgh, PA, USA).

Comments At. & Mol. Phys. (GB), vol.13, no.2, p.51-7 (1983). Theories have been developed to treat charge exchange in ion-atom collision at large impact parameters that are based on asymptotic expressions for electron orbitals, JWKB treatment of orbital distortion and simple classical models for the nuclear motion. These methods, which can be applied without the use of a computer, have been remarkably successful for symmetric charge transfer. The basic elements of the asymptotic theories are reviewed and the problems associated with the application of asymmetric charge exchange are discussed. (17 refs.)

75497 Symmetric charge exchange between negative ions and atoms. S. Kundu, S.B. Karmahapatro (Saha Inst. of Nuclear Phys., Calcutta, India). *Indian J. Phys. Part B*, vol.56B, no.6, p.369-74 (Dec. 1982). [received: May 1983]

The authors have calculated the cross sections of symmetric charge exchange reactions: $\text{H}^- + \text{H} \rightarrow \text{H} + \text{H}^-$ (1) and $\text{Cl}^- + \text{Cl} \rightarrow \text{Cl} + \text{Cl}^-$ (2) in the energy range 1-20 keV using a method similar to that described by Karmahapatro (1965) with an assumption of one electron model of an atom. The wave function for H^- (i.e. the first two terms given by Lowdin and Appel (1953)) and for Cl^- (Lowdin and Appel 1956) have been used in calculating the cross section of the reactions (1) and (2). The transition probability of symmetric charge exchange is calculated with the usual approximation of the first-order time-dependent perturbation theory, while the relative motion of the reactants is considered classically. (18 refs.)

75498 State-selective single-electron capture by 80 keV C^{4+} ions from He, H_2 and Li. D. Dijkkamp (FOM Inst. for Atomic & Molecular Physics, Amsterdam, Netherlands), A. Brazuk, A.G. Drentje, F.J. de Heer, H. Winter. *J. Phys. B (GB)*, vol.16, no.11, p.1343-6 (14 June 1983).

Absolute excitation cross sections for single-electron capture into selected n, l states have been determined by VUV spectroscopy for impact of 80 keV C^{4+} on He, H_2 and Li. For all three collision systems the predominant final ion states belong to one or two electronic shells only. Within such shells a preferential population of higher l sublevels is found. (13 refs.)

75499 Charge transfer and ionisation processes involving multiply charged ions in collision with atomic hydrogen. D.J.W. Hardie, R.E. Olson (Dept. of Phys., Univ. of Missouri-Rolla, Rolla, MO, USA).

J. Phys. B (GB), vol.16, no.11, p.1983-96 (14 June 1983). Total cross sections are presented for the charge transfer reaction $\text{X}^{q+} + \text{H}(1s) \rightarrow \text{X}^{(q-1)+} + \text{H}^+$ and ionisation process $\text{X}^{q+} + \text{H}(1s) \rightarrow \text{X}^{q+} + \text{H}^+ + e^-$. Here X^{q+} is a fully or partially stripped ion. The collision energy range lies between 25-200 keV amu^{-1} . Cross sections are also given for charge transfer into particular ionic n states and n, l states for energies of 25 and 50 keV amu^{-1} , where $\text{X}^{q+} = \text{H}^+, \text{He}^{2+}, \text{C}^{6+}, \text{O}^{8+}$. The calculations were performed by the classical trajectory Monte Carlo method of Olson and Salop (1977), modified to allow for a better representation of the $\text{H}(1s)$ electronic radial distribution. Good agreement is seen with previous classical calculations and with quantum calculations performed by Ryufuku and Watanabe (1979) and others. The authors' results exhibit excellent accord (within 20%) with the measurements of Shah and Gilbody (1981). (13 refs.)

75500 Transfer ionisation in slow collisions of multiply-charged ions with atoms. W. Groh, A. Müller, A.S. Schlachter, E. Salzborn (Inst. für Kernphys., Univ. Giessen, Giessen, Germany).

J. Phys. B (GB), vol.16, no.11, p.1997-2015 (14 June 1983). Systematic experiments on transfer ionisation processes $\text{A}^{q+} + \text{B} \rightarrow \text{A}^{(q-k)+} + \text{B}^+(i-k) + e + \Delta E$ have been performed where A and B are rare-gas atoms, q is the charge state of the incident ions (up to 7 for Ne, 9 for Ar, 12 for Kr and 15 for Xe), k is the number of captured electrons found with the projectile long after the collision ($k=1, 2$ or 3) and i is the charge state of the slow recoil ion (measured by a time-of-flight coincidence technique). The projectile energies range from 3q keV to 15q keV; however, with very few exceptions, the charge-state fractions F_i of recoil ions were found to be independent of the energy in the energy range studied. The ionisation of five additional target electrons in 7% of the two-electron-capture collisions of Xe^{15+} ions with Xe atoms shows the importance of transfer ionisation in such collisions. The observed charge-state fractions of the recoil ions strongly depend on k , the number of electrons captured, and on q , the charge state of the projectile; the mean charge state $\langle i \rangle = \sum_i i F_i / \sum_i F_i$ increases strongly with increasing k and q . In general, the investigated processes are exoergic, and the charge states of the recoil ions produced are correlated with the potential energy available in the collision system. When the charge-state fractions F_i observed for a given target atom are plotted as a function of the maximum potential energy ΔE calculated for transitions between ground

states they fall on common curves which are only specified by the charge state i and the number of electrons k captured indicating that F_i depend explicitly neither upon the projectile species nor upon the incident charge state. (37 refs.)

75501 Single charge exchange in Ar^{6+} -He collisions. L. Opradolce, P. Valiron, R. McCarroll (Lab. d'Astrophys., Univ. de Bordeaux I, Talence, France).

J. Phys. B (GB), vol.16, no.11, p.2017-28 (14 June 1983). Cross sections for single charge exchange from Ar^{6+} incident on He have been calculated for ion energies in the range 1 to 200 keV (0.025 to 5 keV amu^{-1}). The adiabatic potential energies and the relevant radial and rotational coupling matrix elements of the system $\text{Ar}-\text{He}^{6+}$ are first calculated using a model potential method. The collision dynamics are then treated in the framework of the semiclassical (impact parameter) approximation. The cross sections for electron capture into a specific excited state of Ar^{5+} are compared with experiment. The validity of the theoretical model and the possible influence of translation effects are discussed. (21 refs.)

75502 K-shell excitation by K- to L-shell charge transfer in slow Kr^{4+} -Kr and Xe^{4+} -Xe collisions. R. Schuch, E. Justiniano, R. Hoffmann (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany), W. Schadt, H. Schmidt-Bocking, P.H. Mokler, F. Bosch, W.A. Schonfeldt, Z. Stachura.

J. Phys. B (GB), vol.16, no.11, p.2029-37 (14 June 1983). The authors have measured K vacancy production probabilities with decelerated highly-charged Kr^{4+} (2.8 MeV u^{-1}) on Kr and Xe^{4+} (3.6 MeV u^{-1}) on Xe, by particle-photon coincidences. The impact-parameter-dependent probabilities reveal a dramatic change in shape and absolute height as soon as the projectile bears L-shell vacancies. From a comparison with calculations they conclude that K- to L-shell charge transfer can be described, even in the heavy collision system Xe on Xe, by the $2p\pi-2p\sigma$ rotational coupling mechanism when the relativistic energy splitting is taken into account. Deviations from a statistical distribution of the projectile L vacancies between the molecular levels are found. (18 refs.)

75503 Theory of electron capture from a hydrogenlike ion by a bare ion: intermediate-state contributions to the amplitude. S. Alston (Behlen Lab. of Phys., Univ. of Nebraska-Lincoln, Lincoln, NE, USA).

Phys. Rev. A (USA), vol.27, no.5, p.2342-57 (May 1983). Electro capture from a hydrogenlike ion of large nuclear charge Z_p by a bare ion of charge Z_e moving with speed v has been studied using the strong-potential Born approximation to the amplitude. Under the conditions $Z_e \ll Z_T$ and $Z_e v^2 \ll \hbar v$, it is shown that, in comparison with the impulse approximation, the correct weighting of the target spectrum of intermediate states in the strong-potential Born theory significantly alters the $1s \rightarrow 1s$ cross section and at the same time makes peaking approximations to the amplitude more realistic, even for low v . The specific cases of $Z_T = 6, 10$, and 18 are treated over the velocity range $Z_T/3 \leq \hbar v / e^2 \leq Z_T/10$. Instituting a one-electron model, K-shell capture cross sections and probabilities for protons on carbon, neon, and argon are calculated and compared with experiment. The strong-potential Born theory is seen to give a good representation of the data. Total cross sections for $1s \rightarrow 1s$ capture for $Z_p = Z_T = 1$ are also presented. (41 refs.)

75504 Relativistic calculation of atomic M-shell ionization by protons. Mau Hsiung Chen, B. Crasemann (Dept. of Phys. & Chem. Phys. Inst., Univ. of Oregon, Eugene, OR, USA), H. Mark.

Phys. Rev. A (USA), vol.27, no.5, p.2358-64 (May 1983). Relativistic plane-wave Born-approximation calculations of cross sections for M-shell ionization of ^{67}Zn , ^{79}Au , and ^{92}U by protons with incident energies from 0.05 to 1 MeV are reported. Dirac-Hartree-Slater wave functions were employed and binding-energy change and Coulomb deflection were taken into account. Associated X-ray production cross sections were also computed. Results are compared with previous theoretical predictions and with experimental data. Definite improvement in the theory has been attained by the use of realistic wave functions and consistent inclusion of the effects of relativity. (30 refs.)

75505 Charge transfer of doubly charged and trebly charged ions with atomic hydrogen at thermal energies. T.G. Heil (Dept. of Phys. & Astron., Univ. of Georgia, Athens, GA, USA), S.E. Butler, A. Dalgarno.

Phys. Rev. A (USA), vol.27, no.5, p.2365-83 (May 1983). The charge transfer of doubly charged and trebly charged ions of C, N, O, and Ne with atomic hydrogen at thermal energies is studied. Adiabatic potential-energy curves and radial coupling matrix elements are presented. The collision cross sections are calculated after transforming to a diabatic basis. For the trebly charged ions, there exists at least one exit channel into which charge transfer is highly probable. Cross sections for doubly charged ions are sensitive to the energy-level structure of the ionic species. (10 refs.)

75506 Electron capture in small-angle Ar^{2+} -Ar collisions. J. Stevens, R.S. Peterson, E. Pollack (Dept. of Phys., Univ. of Connecticut, Storrs, CT, USA).

Phys. Rev. A (USA), vol.27, no.5, p.2396-402 (May 1983). Electron capture in Ar^{2+} -Ar is studied at low keV energies. Using Ar^{2+} -He collisions as an energy reference the authors show that the dominant single-electron-capture process is endothermic and of the type $\text{Ar}^{2+} + \text{P} + \text{Ar} \rightarrow \text{Ar}^{2+} + \text{P} + \text{Ar}^{3+} + 3p^4 n l$. Detailed studies at 2.4 keV show $n l$ to be predominantly $3d$ and $4p$. Weaker exothermic processes are found and due mainly to long-lived, highly excited states of Ar^{2+} . The direct scattering and double-electron-capture channels are also studied. The direct scattering occurs with no Ar-target excitation. Differential cross sections are presented for the collision processes. The single-electron-capture results are interpreted with the use of a simple model in which a strongly attractive intermediate state couples the incident and outgoing channels. (21 refs.)

34.80 ELECTRON SCATTERING

75507 Use of V^{-1} potentials in Green's function calculations. P.Winkler (Dept. of Phys., Univ. of Nevada, Reno, NV, USA). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1571-7 (April 1983). An analysis of the leading effects of a propagator approach to the calculation of resonance energies is presented. By comparison with Δ SCF results, a simple approximation formula has been developed which contains the main features of the V^{-1} potential option and the diagonal Tamm-Dancoff approximation. This result is expected to be a useful guide for further refinements of the many-body aspects of the theory. (9 refs.)

34.80B Elastic scattering of electrons by atoms and molecules

75508 Application of HHOB approximation to e^{-} -Li elastic scattering. N.S.Rao, H.S.Desai (Phys. Dept., Faculty of Sci., MS Univ. of Baroda, Baroda, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.159-62 (March 1983). High energy higher-order Born (HHOB) approximation is proposed by Yates (1979) is applied to calculate the elastic differential cross-sections and total cross-sections for e^{-} -Li elastic scattering at intermediate energies. Results of the calculations are compared with recent theoretical results of Byron and Joachain (1981) and the experimental data of Williams et al. (1976). (17 refs.)

75509 The $6s6p^2$ resonances in e -Hg scattering. N.S.Scott, P.G.Burke (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland), K.Bartschat.

J. Phys. B (GB), vol.16, no.11, p.L361-6 (14 June 1983). The elastic scattering and excitation cross sections for the $(6s6p)^3P_{0,1,2}$ states in e -Hg scattering are calculated from 4-7 eV using the relativistic R -matrix method. Resonances corresponding to the $6s6p^2$ configuration are found and their effect on the cross sections is discussed. In most cases good agreement with experiment is obtained, and certain features have been clarified. (24 refs.)

75510 The molecular structure of gaseous bis(trimethylsilyl)methane, $CH_3Si(CH_3)_2$, as determined by electron diffraction: an unusually large SiCISi angle. T.Fjelberg (Dept. of Chem., Univ. of Trondheim, Dragvoll, Norway), R.Seip, M.F.Lappert, A.Thorne.

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.295-302 (June 1983). Steric interaction between trimethylsilyl groups in the title compound is relieved by opening the SiCISi angle ($123.2^\circ(9)$), by stretching the central C-Si bonds slightly ($1.889(4)$ Å) and by a torsional displacement of the methyl groups from staggered positions ($25^\circ(5)$). The compound is compared to other strained *t*-butyl or trimethylsilyl substituted methanes and silanes. (14 refs.)

75511 The molecular structure of tetramethylhydrazine: a gas phase electron diffraction study. V.A.Naumov, O.A.Litvinov (Inst. of Organic & Phys. Chem., Acad. of Sci., Kazan Branch, Kazan, USSR), H.J.Geise, J.Dillen.

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.303-7 (June 1983). The molecular structure of tetramethylhydrazine, $(CH_3)_2NN(CH_3)_2$, has been investigated by electron diffraction in the gas phase. Diffraction intensities can be explained by a mixture of gauche and trans conformations in a 70:30% ratio. The r_g structure is characterized by $r(CH) = 1.096$ Å, $r(CN) = 1.463$ Å, $r(NN) = 1.410$ Å, $\angle NCH = 108.6^\circ$, $\angle CNC = 110.8^\circ$ and $\angle NNC = 113.5^\circ$. For the gauche conformation, the dihedral angle between two vicinal methyl groups is 78.5° . (6 refs.)

75512 An electron-diffraction investigation of the molecular structure and thermal dissociation of gaseous PCl_3 at $90^\circ C$. B.W.McClelland, L.Hedberg, K.Hedberg (Dept. of Chem., Oregon State Univ., Corvallis, OR, USA).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.309-13 (June 1983). Interest in the structure of PCl_3 arose in the course of some other work which involved the equilibrium $PCl_3 = PCl_2 + Cl_2$. A part of the work comprised essentially a repeat of Adams and Bartell's experiment *ibid.*, vol.8, p.23 (1971). The authors discovered that under these experimental conditions appreciable amounts of PCl_3 and Cl_2 are generated by shift of the equilibrium—more, apparently, than had been assumed in previous electron-diffraction studies. Since the analysis takes into account the dissociation products, and since the sample was free from components other than those involved in the equilibrium, the authors thought it worthwhile to report the results. (14 refs.)

Electron-correlation effects in electron-scattering cross-section calculations of N_2 See Entry 75528
System for recording electron-atom collision cross sections using an AI-256-6 pulse analyzer See Entry 75551

34.80D Atomic excitation and ionization by electron impact

75513 $2S$ excitation of atomic hydrogen by electron impact at high energies. N.Saha (Dept. of Appl. Math., Univ. Coll. of Sci., Calcutta, India).

Can. J. Phys. (Canada), vol.61, no.5, p.748-52 (May 1983). The $2S$ excitation cross section of atomic hydrogen by electron impact at high energies has been calculated following the method of Das (1979). Comparison of the results for the differential cross section with other theoretical results, and comparison of the results for the total cross section with those of other the results of the present calculations are fairly accurate. (10 refs.)

75514 Low-energy electron impact excitation of the lowest-lying autoionizing level in Li. S.N.Tiwary (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, Ireland).

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.221-3 (13 May 1983). The authors have calculated the electron impact total cross sections for the excitation of the lowest-lying autoionizing level generated due to the core-excitation $1s^2 2s^2 S^+ \rightarrow 1s2s^2 S^+$ transition in the lithium atomic system using Hartree-Fock wavefunctions for both initial and final states within the R -matrix method in the low bombarding energy region. The authors' results show that the energy dependence of cross sections is significantly different in nature from all earlier theoretical predictions. (11 refs.)

75515 Excitation of Be^+ by electron impact. P.S.Ganas, L.P.Gately (California State Univ., Los Angeles, CA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2167-9 (May 1983). A realistic analytic central potential is used to generate wavefunctions for the ground and excited states of singly-ionized beryllium. Generalized oscillator strengths and integrated cross sections from threshold to 5 keV are calculated in the Born approximation for $2s$ - ns , $2s$ - np and $2s$ - nd excitations. Comparison of the cross sections with experimental and theoretical data is discussed for the $2s$ - $2p$ transition. (16 refs.)

75516 Excitation of helium-like ions by electron impact in the first-order exchange Coulomb approximation. S.Nakazaki (Dept. of Appl. Phys., Miyazaki Univ., Miyazaki, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1555-62 (May 1983). Usefulness of the first-order exchange of Coulomb approximation has been examined by applying it to the electron impact excitation processes of helium-like ions. Collision strengths for the excitation from the ground state to the $n=2$ states (2^1S , 2^3S , 2^1P and 2^3P) for Li^+ , C^{4+} , O^{5+} and Si^{13+} have been calculated at energies up to five times the threshold energies. It is found that the present approximation improves the Coulomb-Born-Oppenheimer approximation remarkably and gives results comparable with the five-state close-coupling calculation of Wyngaarden et al. (1979). It is also found that the short range distortion effect is largely taken care of in the present first-order approximation.

75517 Eikonal approach to break-up processes of hydrogen-like ions by electron impact; exchange of electrons. H.Kotegawa (Dept. of Phys., Hiroshima Univ., Hiroshima, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1572-80 (May 1983). The Coulomb-eikonal approximation is applied to evaluate the electron exchange amplitude in the ionization of hydrogen-like ions by an electron impact. This amplitude is reduced to a three-dimensional integral expression suitable for numerical calculations. The cross section including the contribution of the electron exchange is calculated for the ionization of He^+ , whose results show a reasonable agreement with experimental results. The exchange effect is found to be important in the ionization process in the intermediate as well as in the low energy region.

75518 Electron impact double-ionisation of Xe II. M.S.Pindzola (Dept. of Phys., Auburn Univ., Auburn, AL, USA), D.C.Griffin, C.Botcher.

J. Phys. B (GB), vol.16, no.11, p.L355-60 (14 June 1983). Electron impact inner-shell ionisation followed by autoionisation can dominate the total double-ionisation cross section for certain atomic ions. For Xe^{2+} the indirect contribution from the $4d^{10} 5s^2 5p^2 \rightarrow 4d^9 5s^2 5p^3$ ionisation followed by Auger decay is calculated to be three times the direct 'double-knockout' contribution. The distorted-wave inner-shell ionisation cross section is found to be strongly influenced by both ground-state correlations and term dependence in the ejected-electron continuum. The authors' Xe^{2+} results are in reasonable agreement with the recent experimental crossed-beam measurements of Achenbach et al. (1983). (13 refs.)

75519 Production of multiply charged rare-gas ions by relativistic electrons. A.Müller, W.Groh, U.Kneissl, R.Heil, H.Stroher, E.Salzborn (Inst. für Kernphys., Univ. Giessen, Giessen, Germany).

J. Phys. B (GB), vol.16, no.11, p.2039-52 (14 June 1983). Charge state spectra of ions generated in single collisions of 20 to 50 MeV electrons with rare-gas atoms have been measured by a time-of-flight technique. Relative abundances of ions in charge states up to $2+$ for He, $3+$ for Ne, $5+$ for Ar, $7+$ for Kr and $8+$ for Xe were deduced from the experiment. Higher charge states, e.g. $12+$ for Xe, could also be observed; however their quantitative fractions could not be determined. The relative abundances F_i of the different ion charge states i are constant in the investigated energy range; however they rapidly decrease with increasing i —strongly dependent on the atomic number of the bombarded target. The experimental results are in good agreement with calculations based on inner-shell ionisation cross sections folded with charge state distributions which result from the decay of the corresponding initial vacancies. The capability of fast electrons for efficient production of slow highly charged ions in single collisions with atoms is discussed. (21 refs.)

75520 Excitation cross sections of the vanadium atom. A.Yu.Krasavin, A.N.Kuchenev, Yu.M.Smirnov.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.575-80 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.805-11 (May 1982). [received: Feb. 1983]

The ground state of the vanadium atom $4^4F_{3/2}$ refers to the configuration $3d^4 4s^1$, as a rule, the state of one, and sometimes both, s -electrons is altered upon the excitation of this atom by electron impact. The states of the excited vanadium atom can have a multiplicity which differs from the multiplicity of the ground state, i.e. they can be doublet or sextet. The investigation of the excitation processes of such states is of appreciable interest for the physics of atomic collisions and atomic spectroscopy. The authors investigated the excitation of the vanadium atom with an apparatus intended for measurement of the excitation cross sections of atoms of the refractory metals by electron impact. The application of the method of intersecting electron and atomic beams with recording of the photons emitted by the excited atoms from the beam intersection region forms the basis for the experiment. (2 refs.)

75521 Electron-impact excitation-autoionization in the cadmium isoelectronic sequence: a case of target term dependence in scattering theory. M.S.Pindzola (Dept. of Phys., Auburn Univ., Auburn, AL, USA), D.C.Griffin, C.Botcher.

Phys. Rev. A (USA), vol.27, no.5, p.2331-7 (May 1983).

Excitation-autoionization contributions to electron-impact ionization are calculated for several atomic ions in the cadmium isoelectronic sequence. The authors calculate excitation cross sections in the distorted-wave approximation and compare them in one case to a calculation in the close-coupling approximation. They focus attention on the $4d^{10} 5s^2 \rightarrow 4d^9 5s^2 nf$ inner-shell excitations in ln^+ , Sb^+ , and Xe^+ . Hartree-Fock atomic structure calculations for the $4d^9 5s^2 nf$ configurations are found to be highly term dependent. Thus the authors' predictions for the total ionization cross section from the $5s$ subshell for these ions exhibit strong target term dependence. The authors' Xe^+ results are found to be in excellent agreement with the recent experimental crossed-beam measurements of Gregory and Crandall (1983). (26 refs.)

75522 Measurement of the cross section for electron-impact ionization of Be^{4+} ions. D.C.Gregory, D.H.Crandall (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Phys. Rev. A (USA), vol.27, no.5, p.2338-41 (May 1983). The absolute cross section for electron-impact ionization of Be^{4+} has been measured from below threshold to 1500 eV with the Oak Ridge National Laboratory crossed-beams apparatus. Excitation of inner-shell electrons to autoionizing states is found to contribute up to a factor of 10 more than direct processes to the single-ionization cross section, and indirect effects dominate the measurement over the entire energy range studied. Good agreement is found with distorted-wave excitation calculations added to Lotz direct-ionization predictions. (17 refs.)

75523 Subshell formula for the Bethe-Born stopping approximation. J.M.Peek (Sandia Nat. Lab., Albuquerque, NM, USA).

Phys. Rev. A (USA), vol.27, no.5, p.2384-7 (May 1983). It is known that the subshell contributions to the coefficient of the $O(\ln E)$ asymptotic term of the Bethe-Born stopping-number formula are not given correctly by partitioning the squared matrix element defining this coefficient into a simple sum of its subshell contributions. This interesting result is extended to the second, or $O(1)$, asymptotic term in the stopping number. In

this case, the subshell decomposition results in a sum of two expressions. One is simply the subshell decomposition of the squared matrix element defining the $O(1)$ coefficient for the total system. The second term is more complex in form but sums to zero, as it must, when summed over all subshells in the target. It is pointed out that this second term and its summation requirement can be used to impose a useful restriction on the construction of theoretical subshell corrections for the Bethe-Born formula. (12 refs.)

75524 Excitation of hydrogenlike ions from ground state to arbitrary p state by electron impact. N.C.Deb, C.Sinha, N.C.Sil (Dept. of Theoretical Phys., Indian Association for the Cultivation of Sci., Calcutta, India). *Phys. Rev. A (USA)*, vol.27, no.5, p.2447-55 (May 1983).

The authors have formulated a generalized method for the evaluation of the cross sections for $1s\text{-}np$ excitation of hydrogenlike ions by electron impact both in Coulomb-Born and Coulomb-Born-Oppenheimer (CBO) approximations. In this formulation they have replaced the associated Laguerre polynomial for the final-state wave function by an integral representation. The main advantage of the authors' method is that the higher-order parametric differentiations usually adopted in order to obtain the amplitudes for the higher values of the principal quantum number n are avoided by one-dimensional integration. To the authors' knowledge, this is the first attempt to calculate the electron-ion excitation cross section in the CBO approximation for an arbitrary p state without any recourse to partial-wave analysis. They have also calculated asymptotic scaled cross sections for the limit $n \rightarrow \infty$ at different energies. The direct-excitation results are in good agreement with the existing theoretical findings of Tully for different n values in the intermediate- and high-energy regions. (26 refs.)

75525 Electron double ionization cross section in sodium obtained from $K\alpha$ hypersatellite spectra. J.Lahtinen, O.Keski-Rahkonen (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland). *Phys. Scr. (Sweden)*, vol.27, no.5, p.334-8 (May 1983).

The $K\alpha$ hypersatellite spectrum of Na metal has been measured in electron excitation with voltages from 4 to 25 kV. The spectrum shows lines with initial $K^{-2}(K\alpha)^n$ and $K^{-2}L^{-1}$ holes. The energies of these lines as well as the K^2 binding energy have been determined and compared with theoretical calculations. The intensity of the line group with $K^{-2}L^{-1}$ initial configuration relative to the K^{-2} group has been measured and found to be in agreement with simple shake-off calculation. The electron double ionization cross section (EDC) of the K -shell has been determined from both thick and thin target measurements using the method developed by Saijonmaa and Keski-Rahkonen, and found to yield equivalent results. The EDC has also been calculated theoretically using classical and quantum mechanical binary encounter approximations as devised by Saijonmaa. Theory reproduces fairly well the magnitude and the atomic number dependence of the EDC whereas the shape of the EDC-curve as function of energy deviates clearly from observed values. (43 refs.)

34.80G Molecular excitation, ionization, and dissociation by electron impact

75526 Calculation of relative electron impact total ionization cross sections for organic molecules. W.L.Fitch (Zoecon Corp., Palo Alto, CA, USA), A.D.Sauter.

Anal. Chem. (USA), vol.55, no.6, p.832-5 (May 1983). A scheme is presented for the calculation of electron impact total ionization ratios for organic molecules. The scheme is based on the additivity of atomic ionization cross sections. The coefficients for the calculation are determined by a linear regression using 179 total ionization cross section measurements taken from the literature. The average error in the prediction of relative total ionization cross section for the 179 molecules was 4.69% by this approach. Other approaches employing diamagnetic susceptibility and molecular volume are shown to be inferior to the atomic additivity scheme. (23 refs.)

75527 Electron impact investigation of the molecules SeS(g) and TeSe(g) under high-temperature equilibrium conditions. M.Grade, J.Wiencke, W.Rosinger, W.Hirschwald (Inst. für Phys. Chem., Freie Univ. Berlin, Berlin, Germany).

Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.4, p.355-61 (April 1983). SeS(g) and TeSe(g) molecules, produced by Knudsen-cell vaporization of the mixed IIB/VIA-systems ZnS/ZnSe and CdSe/CdTe , were studied by energy-dispersive electron impact ionization. Analysis of ionization efficiency curves yields energy levels of excited ionic states of the molecule ions $\text{SeS}^+(g)$ and $\text{TeSe}^+(g)$. The energy levels correlate with corresponding states of $\text{S}_2^+(g)$, $\text{Se}_2^+(g)$ and $\text{Te}_2^+(g)$ derived from independent photoelectron spectroscopic data. (49 refs.)

75528 Electron-correlation effects in electron-scattering cross-section calculations of N_2 . M.Breitenstein, A.Endesfelder, H.Meyer, A.Schweig, W.Zittlau (Fachbereich Phys. Chem., Univ. Marburg, Marburg, Germany). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.4-5, p.403-9 (27 May 1983). Total differential high-energy electron-scattering cross sections for N_2 have been calculated in the first Born approximation and compared with available experimental data. The importance of including electron correlation is demonstrated. (28 refs.)

75529 Wave packet formulation of the boomerang model for resonant electron-molecule scattering. C.W.McCurdy, J.L.Turner (Dept. of Chem., Ohio State Univ., Columbus, OH, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6773-9 (1 June 1983). A time-dependent formulation of the boomerang model for resonant electron-molecule scattering is presented in terms of a wave packet propagating on the complex potential surface of the metastable anion. The results of calculations using efficient semiclassical techniques for propagating the wave packet are found to be in excellent agreement with full quantum-mechanical calculations of vibrational excitation cross sections in $e^-\text{N}_2$ scattering. The application of the wave packet formulation is a computational and conceptual approach to the problem of resonant collisions with polyatomic molecules is discussed in the light of recent wave packet calculations on polyatomic photo-dissociation and Raman spectra. (27 refs.)

75530 Effect of gravity on density distributions and orthopositronium annihilation rates in ethane and methane near the critical point. S.C.Sharma, S.R.S.Kalle (Dept. of Phys., Univ. of Texas, Arlington, TX, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6897-900 (1 June 1983). The effect of gravity on density distributions has been studied in ethane and methane near the critical points using the linear-model parametric equation of state. The results obtained from this study are used to further understand the sensitivity of orthopositronium annihilation rates to density fluctuations in molecular gases. It is shown that the influence of gravity is too small to account for the recently observed dependence of orthopositronium annihilation rates on the density of ethane gas at 306.4K. However, a significant variation in local density vs. height is calculated at temperatures closer to the gas-liquid critical point. The density and temperature dependencies of the annihilation rates of orthopositronium atoms, recently observed in ethane and methane gases, are discussed in terms of the findings of this study. (19 refs.)

75531 Vibrational excitation of symmetric and bending modes of H_2O by slow electron impact. A.Jain, D.G.Thompson (Dept. of Appl. Math. & Theoretical Phys., Queen's Univ. of Belfast, Belfast, N Ireland).

J. Phys. B (GB), vol.16, no.11, p.1347-54 (14 June 1983). Electron impact vibrational excitation cross sections (differential, integral and momentum transfer) for the symmetric (100) and the bending (010) modes of the H_2O molecule are calculated in the fixed-nuclei and the impulse approximations from threshold to 10 eV. The normal coordinate dependent K -matrix elements are augmented with the laboratory frame first Born matrix elements for higher angular momenta in order to obtain converged cross sections via a closure formula. A sharp threshold peak and a broad resonance structure is seen around 6-8 eV in the integral cross section in agreement with the recent observations: while the A_1 scattering state plays a not unimportant role, the major contribution to this broad feature is due to the B_2 state. All results compare well with the crossed-beam experimental results of Seng and Linder (1974). (24 refs.)

75532 Doubly differential cross sections of secondary electrons ejected from gases by electron impact: 50-400 eV on N_2 . T.W.Shyn (Space Phys. Res. Lab., Univ. of Michigan, Ann Arbor, MI, USA).

Phys. Rev. A (USA), vol.27, no.5, p.2388-95 (May 1983). Doubly differential cross sections of secondary electrons ejected from N_2 by electron impact have been measured by a crossed-beam method. The incident energies used were 50, 70, 100, 200, and 400 eV. The energy and angular range of secondary electrons measured were from 1.0 eV to one-half of the difference between the incident energy and ionization potential and 12° to 156° , respectively. The present results have been compared with two previous measurements and considerable discrepancies were found. (13 refs.)

75533 A method for the numerical investigation of nonstationary processes in multisectinal installations for separating multicomponent isotope mixtures. E.V.Levin, N.I.Lagutsov, G.A.Sulaberidze.

J. Eng. Phys. (USA), vol.43, no.3, p.1027-31 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.456-62 (Sept. 1982). On the basis of the Dufort-Frankel method for the integration of differential equations of parabolic type, the authors develop a method for the numerical calculation of nonstationary processes. (9 refs.)

75534 Optimization of isotope-separation processes in columns. V.A.Kaminskii, V.M.Vetsko, G.A.Tevzadze, O.A.Devdariani, G.A.Sulaberidze. *Sov. At. Energy (USA)*, vol.53, no.3, p.642-7 (Sept. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.3, p.174-8 (Sept. 1982). [received: May 1983]

The production of stable isotopes requires large material expenditures, and therefore the optimization of separating installations has a decisive effect on the economics of production. The authors propose a general method for the multiparameter optimization of cascade installations consisting of packed columns. As the target function for the optimization, they selected the cost of the isotope product, which provides a comprehensive characterization of the total expenditures required for the production process and also determines the choice of the most efficient lines of capital investment and the rational limits of improving the quality of production. (8 refs.)

35.10D Electric and magnetic moments, polarizability

75535 Measurement of polarization and optical alignment of ^4He atoms in the 2^3S state. B.N.Sevast'yanov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1411-13 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2294-7 (Nov. 1982). [received: May 1983] The author notes that Happer (1972), Daniels and Timsit (1971), and Scheerer (1974) measured the polarisation P of ^4He under assumptions which are valid only for optically thin layers. The author's present work is concerned with measuring P and the alignment A for optically oriented 2^3S ^4He atoms for both optically thin and optically thick layers. (11 refs.)

75536 Threshold for suppression of light fluctuations in a shock-heated plasma consisting of monatomic gases (M~9-11). G.K.Tumakayev, Z.A.Stepanova (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1420-1 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2305-7 (Nov. 1982). [received: May 1983]

The authors observe the emission from the plasma stream behind a shock wave front at Mach numbers M~8-9 and M~10-11 for Xe and Ar, respectively, and point out that for the development of flow instability, a necessary condition for fluctuation damping is that the electron collision efficiency (L) and the radiative decay (R), $L/R > 1$, i.e. the excited states must be depopulated more rapidly by collisions than by radiative decay. (8 refs.)

75537 Relaxation rate of atomic orientation. B.G.Matisov (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1421-2 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2307-8 (Nov. 1982). [received: May 1983]

One of the main experimental methods for gaining information on atomic diffusion coefficients or longitudinal collision relaxation times is by studying orientation relaxation of optically oriented atoms in the dark. The author solves the pumping equation analytically to determine the atomic orientation relaxation rate Γ at the initial time $t=0$ just after the optical pumping is discontinued. Exact allowance is made for all of the diffusion modes in the calculation of Γ . The authors found that Γ depends strongly on the pumping rate W. At first sight it seems strange that Γ , which describes relaxation 'in the dark', should depend on W; however, this behavior can be traced to the fact that the spatial distribution of the oriented atoms is determined by W. (5 refs.)

35.10F Relativistic corrections, fine- and hyperfine-structure constants

75538 High-resolution synchronized-quantum-beat spectroscopy using modulation sidebands: measurement of pressure shifts of the hyperfine splitting in sodium $3^2S_{1/2}$. Y.Fukuda, M.Tanigawa, T.Hashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan), K.Kondo. *Opt. Lett. (USA)*, vol.8, no.6, p.301-3 (June 1983).

Pressure shifts of the hyperfine splitting in Na $3^2S_{1/2}$ that are due to buffer gases have been measured for the first time to the authors' knowledge by all-optical means using the method of synchronized-quantum-beat spectroscopy reported previously (Y. Fukuda et al., *Opt. Commun.*, vol.38, p.357, 1981). The substrate coherence is excited and detected with amplitude-modulated mode-locked laser pulses tuned to the D_1 line (pulse-repetition frequency, f_p ; modulation frequency, f_m), and the resonances observed at $f_0 = n f_p + n' f_m$ (n and n' are integers) are used for the measurement. The pressure-shift coefficients obtained at 210°C are 82, 61, -1, and -47 Hz/Torr for He, N₂, Ar, and Kr, respectively, within an accuracy of ± 3 Hz/Torr. (7 refs.)

75539 Molecular mechanics of organic halides. VII. Iodides. A.Y.Meyer (Dept. of Organic Chem., Hebrew Univ., Jerusalem, Israel).

THEOCHEM (Netherlands), vol.11, no.1-2, p.95-106 (June 1983). For pt.VI see J. Chem. Soc. Perkin Trans., vol.2, p.1199 (1982). The molecular-mechanical force field is extended to encompass saturated organic iodides, including non-germinal diiodides. Calculations produce molecular geometry, dipole moment, conformer energies, solvation energies and barriers to internal rotation. Results are reported for 25 molecules, acyclic and cyclic, representing altogether 60 structural variants. Trends in structure and conformational tendency along series of analogous halides are discussed. (70 refs.)

75540 The geometry of the tert-butyl group: statistical analysis and model calculations. A.M.de Vos, A.M.M.Schreurs, J.Kroon (Structural Chem. Group, Rijksuniv., Utrecht, Netherlands), F.B.van Duijneveldt. *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.107-13 (June 1983). A statistical analysis of the geometry of tertiary butoxy groups in molecular crystals reveals a significant departure from C_{3v} symmetry. The optimum geometry obtained by model calculations is in excellent agreement with the mean values of the bond parameters found in this analysis. The loss of three-fold symmetry and the flexibility of the tertiary butoxy group is discussed in terms of intra and intermolecular interactions. (15 refs.)

75541 An answer to the spiro versus ansa dilemma in cyclophosphazenes. III. N₃P₃Cl₃[HN-(CH₂)₄-NH]Cl₂P₃N₃. A serendipitous two-ring bridged-ansa phosphazene. G.Guerch, J.-F.Labarre, R.Lahana, R.Rouques, F.Sournies (Lab. Structure et Vie, Univ. Paul Sabatier, Toulouse, France).

J. Mol. Struct. (Netherlands), vol.99, no.3-4, p.275-82 (June 1983). For pt.II see ibid., vol.96, p.113 (1982). Reaction of N₃P₃Cl₆ with butylene-diamine (1:1) leads to a mixture of the expected monospiro compound as the major product and of two by-products (A) and (B). Mass spectrometry and X-ray analysis prove that (A) has a two-ring assembly structure in which two N₃P₃Cl₃ moieties are bridged through a [HN-(CH₂)₄-NH] entity. (14 refs.)

75542 Isoelectronic molecules: the 13 and 22 electron sequences of diatomics. B.J.Laurenzi, C.Liitto (Dept. of Chem., State Univ. of New York, Albany, NY, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6808-23 (1 June 1983). A theory of isoelectronic molecules (J. Chem. Phys. 74, 1840, 1981) has been applied to the ground state of an even (22) electron and an odd (13) electron sequence of diatomics. Each of these is compared to the 14 electron sequence which had been studied previously. In the first instance, a striking correspondence in the dissociation energy $D_e(Z,Z')$, bond distance $R(Z,Z')$, and force constant $E''(Z,Z')$ surfaces for isovalent molecules from the 14 and 22 electron systems has become apparent. For the second, gross differences which arise in these surfaces when one electron is removed from 14 electron molecules are explicable in terms of the nature of the electron-pair bond as opposed to the one-electron bond. A stability rule which excludes ions with charges greater than plus or minus two units is found to hold for these sequences as well as the 14 electron one. (18 refs.)

- Presents results of an analysis, whose main task is to find the methods and equations for determining magnetic and electric magnitudes of atoms and substances for optical frequency fields. An original approach for the interpretation of the Pauli-Langevin and Van Vleck equations for molar magnetic susceptibility and molar polarizability of atoms gives very interesting results, which can be used to specify the magnitudes for magnetic and electric properties of atoms in the optical frequency region. The analysis starts with the assumption that magnetic and electric properties of atoms and compounds in the optical frequency region correlate with those for static fields. (4 refs.)

35.20P Rotation, vibration, and vibration-rotation constants

- 75546 Out-of-plane force field for cyclic pentaatomic molecules with an OC-X-CO grouping (X=O, NH, CH_2). M.G.Giorgini (Centro Studi Interfacolta sulla Spettroscopia Raman, Univ. di Bologna, Bologna, Italy). *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.37-45 (June 1983).
- An out-of-plane force field common to maleic anhydride and imide has been worked out, emphasis being laid on the CC torsional force constants. The transferability of the calculated force field has been checked in a normal coordinate analysis for 4-cyclopentene-1,3-dione. (19 refs.)
- 75547 Applicability of R-K potential function for calculating molecular parameters of diatomic molecules. N.B.Ishwar, M.P.Varma, B.L.Jha (Dept. of Phys. & Maths., Indian School of Mines, Dhanbad, India). *Indian J. Phys. Part B*, vol.56B, no.6, p.367-8 (Dec. 1982). [received: May 1983]
- Varma and Jha (1981) have proposed a new potential energy function satisfying the necessary criteria of a suitable potential function for diatomic molecules. They have given an expression for calculating the rotational constant (α_e) and have used this expression for estimating the rotational constant (α_e) of alkaline earth halides and hydrides only. However according to Varshni (1957) an acceptable potential energy function should be capable of yielding correct (as far as practicable) values of both the molecular constants α_e and $\omega_e x_e$. The authors note deals with the calculation of α_e and $\omega_e x_e$ for a number of diatomic molecules as a complimentary part of their (Varma and Jha 1981) earlier paper. (7 refs.)

- 75548 High-accuracy wave-number measurements in molecular iodine. L.Housek, W.M.Fairbank, Jr. (Dept. of Phys., Colorado State Univ., Fort Collins, CO, USA). *Opt. Lett. (USA)*, vol.8, no.6, p.322-3 (June 1983).
- Absolute wave-number measurements, with an accuracy of 2-11 parts in 10^9 , are presented for 27 $^{127}\text{I}_2$ hyperfine-structure lines in the range 5763-6563 Å. Individual components were resolved by saturation spectroscopy and their wave numbers measured by a comparison with wavelength standards made using a temperature-stabilized Fabry-Perot interferometer. Good consistency is found among the four accepted $^{127}\text{I}_2$ wavelength standards. The result of a previous measurement at 6563 Å, which was used as the basis for a Rydberg-constant determination, is also confirmed. (7 refs.)

35.20X Mass spectra

- 75549 Mass spectra of some substituted methylcyclodioxanes. E.Pelletier, J.F.Harrod (Chem. Dept., McGill Univ., Montreal, Quebec, Canada). *Can. J. Chem. (Canada)*, vol.61, no.4, p.762-8 (April 1983).
- The mass spectra of the substituted methylcyclodioxanes ($\text{Si}(\text{CH}_3)_2(\text{X})\text{O}_n$, where $\text{X}=\text{H}$ ($n=4, 5$ and 6), $\text{X}=\text{C}_6\text{H}_5$ ($n=3$ and 4), $\text{X}=\text{Br}$ ($n=3$ and 4), $\text{X}=\text{Co}(\text{CO})_4$ ($n=4$ and 5) have been measured. The compounds $\text{X}=\text{H}$ fragment by the same kinds of substituent loss and ring contraction mechanisms as previously reported for the compounds $\text{X}=\text{CH}_3$ but also by the loss of methylhydrogensilane. The compounds $\text{X}=\text{Ph}$ fragment by loss of benzene from an intramolecularly bridging benzenonium ion, formed from $[\text{M}-\text{CH}_3]^+$ and by losses of the phenylmethylsilane fragments. The compounds $\text{X}=\text{Br}$ only undergo substituent loss without ring fragmentation. The compounds $\text{X}=\text{Co}(\text{CO})_4$ show stepwise loss of all CO groups from $[\text{M}]^+$, $[\text{M}-\text{Co}(\text{CO})_4]^+$, and $[\text{M}]^{2+}$. (10 refs.)

35.80 ATOMIC AND MOLECULAR MEASUREMENTS AND TECHNIQUES

- 75551 System for recording electron-atom collision cross sections using an AI-256-6 pulse analyzer. Yu.I.Malakhov, M.B.Shapochkin (Moscow Power Inst., Moscow, USSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.4, pt.2, p.962-4 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.164-6 (July-Aug. 1982). [received: May 1983]
- A block diagram is given for a signal-analyzing system based on an AI-256-6 pulse analyzer. The system is used to measure spectral line intensities and determine how they depend on the electron energy. The basic circuits are given for the stepper motor actuator and for the unit interfacing the Ch3-38 frequency meter with the BS-50 DC power source. (3 refs.)
- 75552 Time resolved polarization spectroscopy: level kinetics and rotational diffusion. A.J.Cross, D.H.Waldeck, G.R.Fleming (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6455-67 (1 June 1983).
- Time resolved polarization spectroscopy is a powerful and sensitive technique for the study of dynamics in the liquid phase. Using this technique, it is possible to obtain information about various relaxation processes in solution, including the motions of molecules in different electronic states, and the transitions between these states. Since the experiment typically measures both electronic relaxation and molecular reorientation, the observed signal can have a complicated form which represents a coupling of these two effects in a way that depends on the particular scheme of decay processes which are present in a given system. The authors present a general algorithm for deriving the form of the experimental signal for an arbitrary scheme for systems exhibiting these phenomena, assuming that the molecular motion is described by asymmetric rotational diffusion. Several examples are presented and experimental results interpreted using the derived formulas, including cases where (1) the excited state diffusion tensor differs from that of the ground state, (2) decay of the excited state occurs to levels that do not return to the ground state, (3) the principal contribution to the signal results from birefringence, (4) there are several intermediate excited states which undergo rapid relaxation, and (5) two overlapping absorption bands create an initial condition with more than one excited state populated. Application of this formalism to fluorescence depolarization experiments is also discussed. (38 refs.)

- 75553 Computer generation of isomeric structures. N.Trinajstic, Z.Jericevic (Rugjer Boskovic Inst., Zagreb, Yugoslavia), J.V.Knop, W.R.Muller, K.Szymanski. *Pure & Appl. Chem. (GB)*, vol.55, no.2, p.379-90 (Feb. 1983). (International Symposium on Theoretical Organic Chemistry, Dubrovnik, Croatia, Yugoslavia, 30 Aug.-3 Sept. 1982).
- The algorithms are developed for computer enumeration and generation of isomeric acyclic structures (alkanes, alkenes, alkynes, alkanols, alkanals, alkanones, etc.), benzenoid hydrocarbons, and aza-benzenoids. They are based on the common strategy which consists of representing a given structure by an integers sequence and the use of the induced order notion. (69 refs.)

36.00 STUDIES OF SPECIAL ATOMS AND MOLECULES

36.10 EXOTIC ATOMS AND MOLECULES (CONTAINING MESONS, MUONS, AND OTHER ABNORMAL PARTICLES)

- 75555 The kaonic hydrogen atom in momentum space. R.H.Landau (Dept. of Phys., Univ. of Surrey, Guildford, England). *AIP Conf. Proc. (USA)*, no.97, p.407 (1982). [received: May 1983] (Proceedings of the Workshop on the Interaction Between Medium Energy Nucleons in Nuclei, Bloomington, IN, USA, 28-30 Oct. 1982).
- It is well known that the strong absorption by a heavy nucleus of a negative kaon in a bound atomic state leads to unusual and sometimes unexpected dependence on the nuclear potential. In order to obtain a theoretical understanding of this problem, and try to understand recent experimental results. The author has studied kaonic hydrogen (K^-p), a conceptually simpler system which nonetheless displays much of the same physics. To do this, the author has applied new momentum space methods to solve the combined Coulomb plus nuclear interactions problem. The author's procedure is an extension of the Kwon-Tabakin (1978) technique of removing the logarithmic singularity of the Coulomb potential via a subtraction procedure suggested by Lande. (3 refs.)
- 75556 Muonium atoms in liquid and solid neopentane. B.W.Ng, J.M.Stadlbauer, Y.C.Jean, D.C.Walker (Chem. Dept., Univ. of British Columbia, Vancouver, British Columbia, Canada). *Can. J. Chem. (Canada)*, vol.61, no.4, p.671-4 (April 1983).
- Relatively long-lived muonium atoms have been observed in neopentane (dimethylpropane). The yields of all muon states are found to be essentially the same in liquid and solid neopentane and the same as those in water. These results have bearings on three matters of current interest in muonium chemistry: the origin of the 'background' spin relaxation; the formation mechanism; and the change in yields at the liquid-solid phase transition. These data were obtained by the μSR technique (muon spin rotation) at the TRIUMF accelerator. (16 refs.)
- 75557 Population of isomeric states in muonic atoms. J.De Kam, G.Wolschin (Inst. fur Theoretische Phys., Univ. of Heidelberg, Heidelberg, Germany). *Phys. Lett. B (Netherlands)*, vol.125B, no.2-3, p.109-12 (26 May 1983).
- The probability to populate the isomeric state in radiationless muonic transitions is calculated. The authors find that for muon induced reactions the population ratio isomeric state to ground state is larger by an order of magnitude as compared to nucleon induced reactions at the corresponding energy. (14 refs.)
- 75558 An experimental investigation of the pressure and concentration dependence of muonic Coulomb capture and cascade in gases. P.Ehrhart, F.J.Hartmann, E.Kohler, H.Daniel (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany). *Z. Phys. A (Germany)*, vol.311, no.4, p.259-66 (1983).
- Muonic Coulomb capture ratios and X-ray intensity patterns in four binary mixtures of the gases N_2 , Ne, Ar, Kr, and Xe have been measured at three atomic ratios. An influence of the concentration has been established. The Lyman series intensity patterns of pure N_2 , Ne, Ar, Kr, and Xe were measured at pressures between 0.4 and 51 bar and found to depend on the pressure. Possible explanations are discussed. 75559 Tri-axial ellipsoids as models for macromolecules in solution: procedures for numerical inversion of the shape functions leading to a stable unique solution. S.E.Harding (Dept. of Biochem., Univ. of Bristol Medical School, Bristol, England).

Comput. Biol. & Med. (GB), vol.13, no.2, p.89-97 (1983).

Two FORTRAN IV algorithms are given for determining the two axial ratios of a macromolecule (as modelled by a tri-axial ellipsoid) from its hydrodynamic parameters. The first involves a simple graphical inversion procedure of the volume independent A and R functions but can only be applied to a restricted range of macromolecules. The second algorithm is more general and involves an R -function constrained non-linear least squares fit to birefringence decay data. (9 refs.)

75560 Photon correlation spectroscopy of polymer solutions. C.Y.Chai, K.W.Min (Calgon Res. Labs., Calgon Corp., Pittsburgh, PA, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.807-20 (May 1983).

A polynomial subdistribution method for analyzing the correlation profile in photon correlation spectroscopy of polymer solutions is described. This method generates a continuous distribution function from the measured photoelectron time-correlation function, which can be related to particle size or molecular weight distribution of solute. The method is tested using simulated data for unimodal and bimodal distributions and compared with cumulant and histogram methods, respectively. The polynomial subdistribution method has an advantage in that it not only generates a continuous distribution curve but also works well for bimodal distributions whose peaks are close together. (14 refs.)

75561 IR-spectroscopic investigation of molecular interactions in segmented polyurethanes. V.P.Volkov, K.V.Nel'son, E.N.Sotnikova, N.P.Apukhina, L.I.Potepun.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.557-61 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.787-92 (May 1982). [received: Feb. 1983]

Experiments were conducted on polytetramethylene oxide (PTMO) elastomers and polybutadiene (PBD) elastomers i.e. two series of urethane elastomers differing in the nature both of the flexible and of the rigid segments. The elastomers were studied in the form of thin films and the spectra were recorded on a Perkin-Elmer two-beam spectrophotometer. The absorption bands in the region of NH and amide I were separated using integral equations of the first kind, with dispersive regularisation. (12 refs.)

36.40 ATOMIC AND MOLECULAR CLUSTERS

75562 Stability of small copper clusters: Cu_3 and Cu_4 . G.H.Jeung, M.Pelissier, J.C.Barthelat (Lab. de Phys. Quantique, Univ. Paul Sabatier, Toulouse, France).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.369-72 (27 May 1983).

The ground states of small clusters of copper atoms (Cu_2 , Cu_3 , and Cu_4) have been studied at the CI level using a small basis set and an effective core potential to describe the copper atom. A near degeneracy of three stable conformations is found for Cu_3 in accordance with the experimental result. The rhombus and T-form are stable for Cu_4 . The binding energy per atom is nearly constant for these clusters. (24 refs.)

75563 Theoretical aspects of cluster formation by keV bombardment of rare-gas solids. B.J.Garrison, N.Wingrad (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.381-6 (27 May 1983).

The mechanism of energy dissipation in argon crystals bombarded by 100 and 500 eV Ar^+ has been examined using classical dynamics. The study indicates that very high yields may be expected and that large molecular Ar clusters, Ar_n , may form via recombination in the near surface region. The results are compared qualitatively to recent matrix-isolation SIMS experiments on a variety of inert-gas solids. (16 refs.)

75564 Understanding the middle atmosphere via the laboratory: ion cluster investigations. R.G.Keesee, A.W.Castleman, Jr. (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA).

Ann. Geophys. (France), vol.1, no.1, p.75-80 (Jan.-Feb. 1983).

Ion clusters can be formed in the laboratory by either of two basic methods. One involves the generation of primary ions, followed by the clustering of neutrals onto these ions, while the second commences with the formation of neutral clusters which are subsequently ionized. Through both approaches, requisite thermochemical and reaction rate data are being acquired which are enabling a more complete understanding of the nature and processes of the middle atmosphere including its composition, electrical conductivity, and aerosol formation mechanisms. Laboratory methods and measurements concerning the formation, structure, and stability of small clusters are reviewed, with

emphasis on the manner in which these results can be and have been applied to problems related to the middle atmosphere. (37 refs.)

Electronic structure of small copper clusters See Entry 75286

40.00 CLASSICAL AREAS OF PHENOMENOLOGY

41.10F Steady-state electromagnetic fields; electromagnetic induction

75565 Electromagnetic field of an oscillating point dipole in the presence of spherical interfaces. M.T.Hirvonen (Acta Polytech. Scandinavica, Helsinki, Finland).

Acta Polytech. Scand. Math. & Comput. Sci. Ser. (Finland), no.Ma39, p.1-37 (1983).

The electromagnetic field of a sinusoidally oscillating electric or magnetic point dipole is calculated in the presence of spherical inhomogeneities. An analytical series solution of the Helmholtz equation in a space containing one sphere is first derived on the basis of the spherical wave expansion of the retarded vector potential of a dipole. The solution is completely general with respect to the frequency and the values of the constant permittivity, permeability and conductivity of the sphere and its surroundings. A system of two concentric spheres is next treated in a similar way. Finally, an analytical formula for the translatory transformation of the vector wave functions is applied to derive a precise solution to the problem of the scattering of dipolar waves from a system of two nonconcentric spheres. A number of numerical examples chosen to represent practical situations in geophysical mineral exploration are given. (5 refs.)

Determination of electromagnetic field scattered by small defects and influence of boundary between media See Entry 75571

41.10H Electromagnetic waves: theory

75566 Energy and power of nonperiodic fields in nonlinear lossy media. P.Proksch (Inst. für Nachrichtentechn., Tech. Univ. Wien, Wien, Austria).

Arch. Elektron. & Übertragungstechn. (Germany), vol.37, no.5-6, p.165-70 (May-June 1983).

General relations for the energy and power of nonperiodic electromagnetic fields in nonlinear lossy media are derived. They are inequalities and can be considered as a generalization of relaxations for the power of sinusoidal fields discovered by P. Penfield (1960). With the relations derived it is possible to determine limiting values for the energy levels in the different frequency bands and the conversion efficiency for various cases of frequency conversion. (5 refs.)

75567 Electromagnetic plane wave diffraction by a body of revolution. A.Ciarkowski (Lab. of Appl. Math. Phys., Tech. Univ. of Denmark, Lyngby, Denmark).

Bull. Acad. Pol. Sci. Ser. Sci. Tech. (Poland), vol.30, no.1-2, p.21-30 (1982).

The problem of electromagnetic plane wave diffraction by a perfectly conducting, convex body of revolution with a rim is considered. The analysis is based on Ufimtsev's method (1962) of edge waves. A high-frequency approximation to the scattered field is constructed. (1 ref.)

75568 A coordinate-free approach to wave reflection from a uniaxially anisotropic medium. H.C.Chen (Dept. of Electrical & Computer Engng., Ohio Univ., Athens, OH, USA).

IEEE Trans. Microwave Theory & Tech. (USA), vol.MTT-31, no.4, p.331-6 (April 1983).

Presents a coordinate-free method of solving the problem of electromagnetic wave reflection from the surface of uniaxially anisotropic medium. Based on the direct manipulation of vectors, dyadics, and their invariants, the method eliminates the use of coordinate systems. It facilitates solutions and provides results in a greater generality. The paper contains the following results in coordinate-free forms: (a) the dispersion equations; (b) the directions of field vectors; (c) the Poynting vectors (ray vectors) and group velocities; (d) the laws of reflection and refraction; and (e) the transmission and reflection coefficients. The results are valid for the incident wave having any polarization, and the optic axis of the uniaxial medium being arbitrarily oriented with respect to the interface and the plane of incidence. (20 refs.)

75569 Random non-linear electromagnetic waves in vacuo. P.H.Roberts (School of Math., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).

Physica A (Netherlands), vol.119A, no.1-2, p.274-90 (April 1983).

The attempt made by Einstein and Stern to deduce Planck's law by classical reasoning, invoking only the zero-point background radiation, is reconsidered for a sea of electromagnetic waves, the interactions necessary for thermalization being provided by non-linearities in the wave equations rather than by, as in their case, charged particles. It is shown that, when the Cabot-Putterman ansatz is invoked, the resulting Wave-Boltzmann equation possesses Planck's law as steady-state solution. (17 refs.)

75570 Wave excitation of an oscillator having a discrete series of stable amplitudes. D.B.Duboshinski, Ya.B.Duboshinski. *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.564-5 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.605-7 (July 1982). [received: April 1983]

Examines the excitation of a nonlinear oscillator by a wave. It is shown that under certain conditions undamped oscillations are excited at a frequency close to the natural frequency. The possible amplitudes of the oscillations form a discrete spectrum, with the amplitudes remaining practically constant over a wide range of wave intensities. (5 refs.)

75571 Determination of electromagnetic field scattered by small defects and influence of boundary between media. A.A.Orlovskii (Physicomech. Inst., Acad. of Sci., Ukrainian SSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.705-12 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.43-51 (Sept. 1982).

An analytical solution is obtained to the problem of electric and magnetic dipole moments equivalent to an ellipsoidal defect in space, for an arbitrary source of primary field and for a defect of dimensions much smaller than the wavelength, taking into account the effect of the boundary between media on determining the moments of equivalent dipoles. The derived equations for the field vectors are extended to the case of plane-layer media. (17 refs.)

75572 Transverse transport processes of charged particle systems in a strong magnetic field. II. Some discussions about the Boltzmann equation. Ho Yu-ping (Inst. of Plasma Phys., Acad. Sinica, Hefei, China). *Commun. Theor. Phys. (China)*, vol.1, no.4, p.441-8 (1982).

For pt.1 see *ibid.*, vol.1, no.4, p.441-8 (1982). It is pointed out that in a strong magnetic field the usual Boltzmann equation with Lorentz force term is inconsistent with the fundamental requirements of the general theory of non-equilibrium statistical mechanics. Furthermore, if a collision term corresponding to particles in different gyroorbits is used, the author finds that all the transport coefficients are exactly zero. General expressions for the transport coefficients in classical systems are then obtained by introducing the macroscopic velocities. A comparison between the author's results and those of the usual Boltzmann equation indicates that in the case of short range force, the lowest order terms are the same and the results of the Boltzmann equation become increasingly worse as more higher order terms are kept. 42.10 PROPAGATION AND TRANSMISSION IN HOMOGENEOUS MEDIA

75575 Diffraction of the Hermite-Gaussian waves on opaque semi-infinite plane. L.Janicijevic (Fakultet za Fiziku, Univ. 'Kiril i Metodij' vo Skopje, Skopje, Yugoslavia).

J. Opt. (France), vol.14, no.2, p.83-92 (March-April 1983). The diffracted wave amplitude and the irradiance distribution are found for the case of an m, n -mode incident Hermite-Gaussian wave on an opaque semi-infinite plane. It is done by the method prescribed by Miyamoto and Wolf (see *Journ. Optic. Soc. Am.*, vol.52, p.615 and 636, 1962), which is based on Young's idea for interpretation of diffraction phenomena. The results obtained by this method are expressed in a form which allows a suitable qualitative interpretation of the diffraction pattern. The results of the general mode theory, are specialised to the case of the fundamental mode and the first few modes of the Hermite-Gaussian incident wave beam. (9 refs.)

75576 Generalized reciprocity for gratings of finite conductivity. A.Roger (Lab. d'Optique Electromagnetique, Faculte des Sci. et Tech., Centre de Saint-Jerome, Marseille, France).

Opt. Acta (GB), vol.30, no.5, p.575-85 (May 1983). Demonstrates generalized reciprocity relations in the two fundamental cases of polarization for gratings of finite conductivity. These relations are the analogues of those described in a previous paper for infinitely conducting gratings (see *ibid.*, vol.29, p.1427, 1982). The classical expressions of energy conservation and the reciprocity theorem are then derived, as well as the linear relations (i.e. functional derivatives) between small variations of the groove profile and of the complex coefficients describing the diffracted field. Moreover, the author shows that the relations for finite conductivity tend towards the relations already found for infinite conductivity when the index of the material tends towards infinity. Several numerical examples are then given to make clear the usefulness of the functional derivatives. (10 refs.)

75577 Centro-symmetry in Fraunhofer diffraction patterns. A.W.Lohmann, J.Ojeda-Castaneda (Phys. Inst., Erlangen, Germany).

Opt. Acta (GB), vol.30, no.5, p.629-37 (May 1983). Most of the known Fraunhofer diffraction patterns are centro-symmetrical. The cause of this symmetry is usually a real object transmittance, but complex objects with phase factors can also cause diffraction patterns with centro-symmetry. Actually, the set of real objects is only a small sub-set of the set of all those objects that produce diffraction patterns with centro-symmetry. (5 refs.)

75578 Fraunhofer diffraction patterns of tilted planar objects. K.Patorski (Warsaw Tech. Univ., Inst. of Design of Precise & Optical Instruments, Warsaw, Poland).

Opt. Acta (GB), vol.30, no.5, p.673-9 (May 1983). Attention is drawn to the changes in the Fraunhofer diffraction patterns encountered when the planar objects become tilted with respect to the optical axis. The differences between the far-field images observed in the well-known untitled case and the one investigated are shown and discussed using examples of familiar objects, such as square or rectangular apertures and linear diffraction gratings. (3 refs.)

75579 Exact calculations of the diffraction of s-polarized electromagnetic radiation from large-amplitude dielectric gratings. N.Garcia (Dept. de Fisica, Univ. Autonoma de Madrid, Madrid, Spain), A.A.Maradudin.

Opt. Commun. (Netherlands), vol.45, no.5, p.301-6 (1 May 1983). On the basis of the extinction theorem form of Green's theorem the authors have calculated the diffraction of s-polarized electromagnetic radiation from large amplitude, dielectric gratings of several different profiles. The authors demonstrate the existence of Wood 'anomalies' for gratings of sufficiently large amplitude, and identify them as threshold singularities. No evidence of resonance singularities due to the excitation of leaky surface waves supported by the grating is obtained for the grating profiles and corrugation strengths considered here, in contrast with earlier interpretations of analogous results. Rainbow scattering is predicted. Finally, no significant enhancement of the scattered field by the grating surface is found. (17 refs.)

75580 Exact calculations of p-polarized electromagnetic fields incident on grating surfaces: surface polariton resonances. N.Garcia (Dept. de Fisica Fundamental, Univ. Autonoma de Madrid, Madrid, Spain).

Opt. Commun. (Netherlands), vol.45, no.5, p.307-10 (1 May 1983). Exact calculations of the interaction of p-polarized light from grating surfaces are presented by using the theory of Toigo, Marvin, Celli and Hill (see *Phys. Rev.*, vol.B15, p.5618, 1977). New features for the scattered field are found for light resonating with surface plasmon polaritons; the reflectivity present maxima for large amplitude gratings. The electromagnetic field is calculated on a fine grid near the grating. The author finds enhancements of the order of 200 to 300 for the square of the field that could partly explain SERS. (13 refs.)

75581 Reflection of ultrashort pulses from layered media. S.A.Shakir, N.A.Yusuf, M.C.Mirzaa (Dept. of Phys., Yarmouk Univ., Irbid, Jordan).

Opt. Commun. (Netherlands), vol.45, no.5, p.317-19 (1 May 1983). The reflection of very short pulses from optical systems composed of planar layers is solved in terms of a simple finite series. The series correspond to the superposition of the pulses reflected from all the boundaries. Each term in the series is the scaled and time-shifted replica of the incident pulse. The case of a single film (Fabry-Perot interferometer) is solved exactly in terms of an infinite series similar to the series found for the more general system. (4 refs.)

75582 Marechal intensity formula for small-Fresnel-number systems. S.Szapiel (Inst. of Design of Precise & Optical Instruments, Warsaw Tech. Univ., Warsaw, Poland).

Opt. Lett. (USA), vol.8, no.6, p.327-9 (June 1983). A simple modification of the known Marechal intensity formula is proposed. It enables one to evaluate the near-the-diffraction-focus intensity distribution for well-corrected optical systems with small Fresnel numbers of the focusing geometry. As an example, the focal-shift effect in perfect systems is briefly reexamined. (22 refs.)

75583 Electromagnetic formulation for treating optical reflections from graded-material surfaces. A.G.Lieberman.

Report NBS-TN-1171, Nat. Bur. Stand., Washington, DC, USA (Dec. 1982), 32 pp.

The reflection of a monochromatic plane wave falling obliquely upon the surface of an arbitrary, flat, depth-dependent material is investigated theoretically. The complex reflection coefficient for either principal (s or p) polarization of the field is shown to satisfy a nonlinear differential equation of the Riccati type. An alternate formulation based on the wave impedance (i.e., impedance or admittance) functions is also presented. The impedance functions are shown to satisfy Riccati differential equations of their own. The reflection coefficient formulation and the wave impedance formulations are related via a bilinear algebraic transformation. Singularities appearing in the reflection coefficient formulation may be suppressed in the impedance formulation, and vice-versa. The advantage of either formulation is that the reflection coefficients for an arbitrary, depth-dependent medium can be obtained directly without having to solve Maxwell's equations for the internal field configurations.

42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

- 75584 On stochastic models of light absorption. J.E.Mann (Dept. of Statistics, Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA). *Bull. Math. Biol. (GB)*, vol.45, no.2, p.229-37 (1983).
Previously developed light absorption models have treated the effective quantity of light-absorbing material within the experimental environment as a constant, i.e. a parameter. These models are, however, probabilistic in nature and are properly applied and interpreted only in statistical sense. Thus, it is clearly logical to regard the effective quantity of light-absorbing material to be a random variable. In this paper an asymptotic distribution is derived for this random quantity, and it is shown how this distribution may be incorporated into present models. These results may be applied to light absorption by plant and crop canopies as well as to liquid or solid media. Furthermore, previous models are based upon the assumption that light is parallel, or effectively so, as for solar light. Such models may be inadequate for an artificial (laboratory) environment which utilizes point source light. Present models for estimating light interception and radiation intensity are modified so as to accommodate a proximate point source of light. Numerical examples are included to illustrate the theory. (11 refs.)
- 75585 The a priori calculation of the diffuse reflectance of a turbid medium. H.G.Hecht (Dept. of Chem., South Dakota State Univ., Brookings, SD, USA). *Opt. Acta (GB)*, vol.30, no.5, p.659-68 (May 1983).
A derivation has been given by Hartel (see Licht., vol.10, p.141, 1940) which relates the angular distribution of multiple scatter to that of single scatter, as determined by the Mie theory. Hartel's result is used to generalize Thiesing's equations for a medium which both scatters and absorbs radiation. The result is similar to the two-parameter theories used by numerous other workers, the difference being that the formulation given here constitutes an a priori method which relates the multiple scattering characteristics to the single scatter problem, whose solution is well known. Reflectance properties are calculated by numerically solving the equations for two illustrative cases. (14 refs.)

42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

- 75586 Analytical tools for nonlinear image restoration. W.A.Porter, P.D.Oliver (Dept. of Electrical & Computer Engng., Louisiana State Univ., Baton Rouge, LA, USA). *Appl. Opt. (USA)*, vol.22, no.10, p.1424-6 (15 May 1983).
The authors point out a common interest between the optical processing and the system theory communities. Study of the work of Saleh et al. (see ibid., vol.20, p.4089, 1981) is taken as a case in point. The image retrieval algorithm of Saleh et al. is shown to be a special case of a more general algorithm available in the work of Rall (see Rendiconti del Circolo Matematico di Palermo Ser.2, vol.10, 1961). The authors also summarise some selected results from the system theory literature that may be of interest to the optical processing community. (12 refs.)
- 75587 Broad spectral band color image deblurring. T.H.Chao, S.L.Zhuang, S.Z.Mao, F.T.S.Yu (Electrical Engng. Dept., Pennsylvania State Univ., University Park, PA, USA). *Appl. Opt. (USA)*, vol.22, no.10, p.1439-44 (15 May 1983).
A broadband white-light processing technique for smeared color photographic image deblurring is described. The technique utilizes a diffraction grating method to disperse the smeared image spectra in the Fourier plane so that the entire spectral band of the white-light source can be utilized for the deblurring. In this paper the technique of synthesizing a fan-shape type complex deblurring filter to accommodate wavelength variation is presented. Experimental results showed that this broad spectral band processing technique offers an excellent coherent artificial noise suppression, and the technique is particularly suitable for color image deblurring. Experimental demonstrations and comparisons with the narrowband and coherent deblurring are also provided. (12 refs.)
- 75588 Image processing for extended depth of field. R.J.Pieper, A.Korpe (Dept. of Electrical & Computing Engng., Univ. of Iowa, Iowa City, IA, USA). *Appl. Opt. (USA)*, vol.22, no.10, p.1449-53 (15 May 1983).
Improvement in the depth of field is demonstrated by properly processing a succession of image samples. Due to the limited depth of field each image sample has in-focus as well as out-of-focus segments. By setting criteria for selecting the in-focus segments, an improved composite image is formed. Three algorithms for implementing this construction are discussed. (9 refs.)
- 75589 Transforming images into block stationary behavior. R.N.Strickland (Electrical Engng. Dept., Univ. of Arizona, Tucson, AZ, USA). *Appl. Opt. (USA)*, vol.22, no.10, p.1462-73 (15 May 1983).
The statistical behavior of images is inherently nonstationary. Unfortunately, most image processing algorithms assume stationary image models. Spatially adaptive algorithms have been developed which take into account local image statistics. In this paper the author derives radiometric and geometric transforms which generate nearly stationary (block stationary) images in the first and second moments. The author shows that true stationarity is impossible to realize. The aim of these transformations is to enhance the performance of nonadaptive processing techniques in particular data compression. (17 refs.)
- 75590 Achromatic system for far-field diffraction with broadband illumination. R.Ferriere, J.P.Goedebuer (Lab. de Phys. Generale et Optique, Univ. de France-Comte, Besancon, France). *Appl. Opt. (USA)*, vol.22, no.10, p.1540-5 (15 May 1983).
An achromatic Fourier transformer working with spatially coherent but temporally incoherent light is described both theoretically and experimentally. The achromatic Fraunhofer diffraction pattern results from the incoherent superposition of the monochromatic diffraction patterns generated by every spectral component of light. Wavelength compensation is achieved by a specific configuration combining airspaced zone plates and lenses. Several parameters, such as the spectral resolution of the setup or the spectral broadness of the source, govern the accuracy of coincidence of the various monochromatic patterns. Experimental results demonstrate the broadband operation of the system; the error on the achromatic Fourier transformation is 2% over the visible spectrum. Applications in colored image processing are also reported. (15 refs.)
- 75591 Coherent optical fiber communication potential and problems. E.E.Basch, H.A.Carnes (Communications Products Lab., GTE Labs. Inc., Waltham, MA, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.355, p.43-8 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982).
Optical guided wave transmission has provided both economic and technical advantages for an array of telecommunication applications. The advances in capability of optical transmission have been the result of dramatic improvements in fiber and other opto-electronic devices. What has not changed significantly is the technique of superimposing information onto the optical carrier. As a result, the information carrying capacity and also the repeater free operation of guided optical wave systems have not reached their full potential. Coherent optical communications is an approach whereby information is carried out by either the amplitude, frequency or phase of an optical carrier. Heterodyne detection would increase receiver sensitivity and permit closer optical carrier spacing and thus increase information carrying capacity. This would be achieved by IF filtering with highly selective electrical networks. There are several implementation difficulties that must be overcome to achieve the advantages of optical coherent communications. (6 refs.)
- 75592 Gray level pseudocolouring with three primary colours by a diffraction grating modulation method. J.A.Mendez, J.Bescos (Inst. de Optica, Madrid, Spain). *J. Opt. (France)*, vol.14, no.2, p.69-73 (March-April 1983).
Presents a two step procedure which encodes the object intensity transmittance, the contrast reversal transmittance and the product of both transmittances in three primary colours from a grey tone object transparency. First, a diffraction grating is used to generate and modulate the three transmittances in different orientations. Then, the pseudocoloured image is obtained through selective colour filtering of the diffraction orders in the Fourier plane of a white light partially coherent system. The theoretical analysis, method and some experimental results are provided. (15 refs.)
- 75593 On some explicit deconvolution formulas. C.A.Berenstein (Univ. of Maryland, College Park, MD, USA), B.A.Taylor, A.Yger. *J. Opt. (France)*, vol.14, no.2, p.75-82 (March-April 1983). In French.
The aim is to solve the following problem: given several measuring devices defined by a convolution with distributions μ_1, \dots, μ_m of compact support in R^n one would like to construct explicitly deconvolutors, i.e. distributions ν_1, \dots, ν_m , also of compact support, such that: $\mu_1 * \nu_1 + \dots + \mu_m * \nu_m = \delta$ where δ designs the convolution operation; such distributions ν_1, \dots, ν_m define measuring devices which, as soon as they have been constructed, allow one to reconstruct exactly an arbitrary signal $f \in C^\infty(R^n)$ which was measured through the original devices defined by convolution, with distributions μ_1, \dots, μ_m . By explicit, the authors mean that ν_1, \dots, ν_m are given by formulas involving the μ_i, \dots, μ_m , convolution, differentiation, integration and sums. The authors try to solve that kind of problem under particular hypothesis on μ_1, \dots, μ_m , so as to include all examples where the question has arisen and specially the case of the use of two optical devices whose transfer functions are $1/\pi R_1(J_1(r_1)/r)$ and $1/\pi R_2(J_1(r_2)/r)$ with distinct R_1 and R_2 . (16 refs.)
- 75594 A new method for noncoherent image processing by using an astigmatic system. N.G.Gaggioli, P.Bouchaud (Dept. de Fisica, Inst. Nacional de Tecnologia Industrial, Buenos Aires, Argentina). *J. Opt. (France)*, vol.14, no.2, p.93-105 (March-April 1983). In French.
When a point on a uniform background is observed through an astigmatic system (for instance, cylindrical lenses), the image will be a segment which is perpendicular to the cylinder. A line parallel to the cylinder would give an almost invisible image after traversing the system; on the other hand a line parallel to the astigmatic segment will give an enhanced image. By using such a simple device, spatial filtering could easily be performed by rotating the astigmatic system. This method allows one to perform optical processing, giving highly luminous images. It is thus possible to work in real-time using noncoherent light. (3 refs.)
- 75595 Optical pseudocolor encoding using adaptive electronic halftoning. C.Billotet-Hoffmann, O.Bryngdahl (Dept. of Phys., Univ. of Essen, Essen, Germany). *Opt. Commun. (Netherlands)*, vol.45, no.5, p.327-30 (1 May 1983).
Conversion of density to pseudocolor may be achieved using halftone recordings in optical filtering setups. The authors show and point out the possibility of applying object dependent electronic halftoning techniques for this purpose. (5 refs.)
- 75596 Formation of fine-structure image by corner reflectors, operating on the basis of the total internal reflection effect. G.V.Denisuk, V.I.Korneev. *Sov. J. Opt. Technol. (USA)*, vol.49, no.9, p.535-7 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.1-3 (Sept. 1982).
It is shown analytically and experimentally that the light wave, reflected by an ideal corner reflector, operating on the basis of the total internal reflection effect, is split into six elementary light waves that are not in phase with each other. The energy distribution in the diffraction image of a point in the form of six nuclei, located at the joints of the reflector sectors symmetrically with respect to the seventh central nucleus. All the nuclei have approximately equal intensity, and the pattern is limited by the diffraction in an individual sector. (12 refs.)

75597 Image formation in electron-beam-charged (001)- and (110)-cut $\text{Bi}_{12}\text{SiO}_{20}$ and $\text{Bi}_{12}\text{GeO}_{20}$ slices. V.N.Astratov, A.V.II'inskiĭ, S.N.Reznikov, O.M.Rysakov (A.F. Ioffe Physicstechn. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.455-6 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1056-9 (Sept. 1982). [received: May 1983]

Room-temperature-operating spatial-temporal light modulators made from $\text{Bi}_{12}\text{SiO}_{20}$ and $\text{Bi}_{12}\text{GeO}_{20}$ crystals, with electron-beam addressing, have recently attracted interest. The authors used crystalline slices cut in two orientations: with the (001) cut and with the (110) cut. The slices were covered with an insulating film and had dimensions of $30 \times 30 \times 0.8$ mm. In the (001) case the electron beam produces a positive image with a large-detail contrast of 40:1. In the (110) case the spatial-frequency spectrum does not contain a zero component, and the image obtained is contoured. In both cases the electron-beam energy was 7 keV. The complete brightening of the slice in the (001) case and the maximum image contrast in the (110) case were achieved at electron-beam currents below $30 \mu\text{A}$. (8 refs.)

75598 Fingerprint identification by matched filtering using photorefractive crystals. S.F.Su, D.K.Hamrick (Dept. of Electrical Engng., Univ. of South Florida, Tampa, FL, USA).

IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.322-4

Fingerprint identification by matched filtering using photorefractive crystals (lithium niobate) is investigated. This technique has several advantages over the conventional methods. With lithium niobate as the matched filter recording medium the authors have obtained a signal-to-noise ratio several db higher than that with photographic films. This technique utilizes photorefractive effect to produce Fourier transform holograms inside the crystal. This approach has shown better separation of the output signals. The possibility of the performance of parallel filtering with a large number of fingerprints, based on the angular selectivity property of volume holograms, is also investigated. (24 refs.)

(for acoustic holography, see 43.63)

75599 Planar volume phase holograms formed in bleached photographic emulsions. R.R.A.Syms, L.Solymer (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England).

Appl. Opt. (USA), vol.22, no.10, p.1479-96 (15 May 1983).

Volume phase holograms are formed by a standard process in commercially available photographic emulsion. The material is characterized before recording, and initial experimental results are presented for reconstruction under index-matched conditions. An initial comparison is made using two-wave coupled-wave theory and a technique of curve fitting with experimental measurements of transmission and diffraction efficiency. The model works well close to the Bragg condition, but several differences are noted between theory and experiment away from the Bragg condition. An anomalous absorptive effect is noted in transmission. An improved model is then formulated, again using coupled-wave theory, and capable of analytic solution, taking into account phase and absorption modulation, a second harmonic in the grating profile and the appearance of some higher diffraction orders. Using this model, all the initial experimental results are satisfactorily explained, and the effect of spurious gratings in the hologram response is noted. The model is then used with an extensive set of experimental results to deduce the major characteristics of the material, including saturation of the modulation with exposure. The formulation of a mixed grating and possible dispersion of the modulation are also investigated. Suggestions are made for the design of more complicated components using this material and for material improvement. (50 refs.)

75600 Binary holographic LO beam multiplexer for IR imaging detector arrays. W.B.Veldkamp, E.J.Van Allen (MIT Lincoln Lab., Lexington, MA, USA).

Appl. Opt. (USA), vol.22, no.10, p.1497-507 (15 May 1983).

A binary holographic technique for infrared laser beam multiplexing is described. The technique was used to generate amplitude distribution matched and phase matched local oscillators for a heterodyne IR imaging detector array. It uses a high accuracy interlaced binary diffraction grating to multiplex single LO wave fronts. (26 refs.)

75601 Aberrations of holographic toroidal grating systems. M.P.Chrisp (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Appl. Opt. (USA), vol.22, no.10, p.1508-18 (15 May 1983).

Expressions are derived for the sixteen wave front aberration coefficients of a single grating. These give the wave aberration to the fourth order for a plane symmetric grating system. The contributions from each mirror and grating can be added to give the aberrations in the final image. Problems encountered with intermediate astigmatic images are overcome by defining the wave front aberration with respect to an astigmatic reference surface. There is one field variable describing displacement of the object point from the symmetry plane. The aperture stop may be placed anywhere in the system, and equations are given for the aberration changes produced by shifting this position. (13 refs.)

75602 Fabrication of PMMA holographic grating by KrF excimer laser. M.Murahara, Y.Kawamura, K.Tooyoda, S.Namba (Inst. of Phys. & Chem. Res., Wako, Japan).

Oyo Buturi (Japan), vol.52, no.1, p.83-9 (Jan. 1983). In Japanese.

Preparation, sensitization and developing procedures to fabricate holographic gratings with groove spacing between $2.7 \mu\text{m}$ and $0.19 \mu\text{m}$ on a thin PMMA film are described. Polymethyl methacrylate (PMMA) sensitized by 4~7% anthracene at the KrF laser wavelength (249 nm) was used as the photosensitizer. A sensitivity about one hundred times larger as compared with pure PMMA was realized. This sensitization made it possible to obtain the grating by a single exposure of the short KrF laser pulse (12 ns). As recording equipment, a new interferometer was designed. Using this optical system, the authors were able to change the grating pitch over a wide range without readjustment of the optical axis. (18 refs.)

75603 Contra-directional two-wave mixing in photorefractive media. P.Yeh (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).

Opt. Commun. (Netherlands), vol.45, no.5, p.323-6 (1 May 1983).

The energy transfer between two counter-propagating beams in photorefractive media is analyzed. A solution of a nonlinear model of holographic two-wave mixing is presented. Expressions for the transmissivity are obtained and discussed. (14 refs.)

75604 Wave amplification and parametric generation by dynamic holograms on surfaces. N.F.Pilipetskii, A.N.Sudarkin, V.V.Shkunov (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.558-60 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.324-7 (July 1982). [received: April 1983]

Recent papers on phase conjugation (or 'wavefront reversal') at an interface have drawn attention to the problem of converting light and sound beams by means of dynamic holograms recorded on a reflecting surface. The authors discuss the problems of dynamic correction and amplification of beams by means of holograms of this type, and also the possibility of using such holograms to create a parametric generator of sound or light waves having a high degree of directionality. (12 refs.)

75605 Polarisation control of tone transmission brightness in holographic image of light scattering surfaces and layers. O.V.Angelskii, A.G.Uschenko, V.V.Tkach, V.V.Yatsenko.

Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.603-5 (April 1983). In Russian.

It is shown that the tone transmission brightness in images of planar inhomogeneous optical objects depends on the polarisations of the illuminating and reference fields as well as on the angular characteristics of the holographic recording. A matrix method is proposed for the calculation of the reconstructed holographic image brightness and the optimum polarisation of the reference field. By varying the polarisation and angular characteristics of the recording, it is possible to increase or decrease the image brightness by 5-15 times. (2 refs.) V.G.P.

75606 Properties of holographic gratings in silicon crystals under ultrashort light pulse recording. I. Theory. L.V.Mizrukhin, I.I.Peshko, M.S.Soskin, A.I.Khizhnyak.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.675-83 (May 1983). In Russian.

Dynamic characteristics of the diffraction grating in Si are investigated theoretically in case of ultrashort light pulse recording. The main physical mechanisms affecting the refractive index variation are analyzed for a Si crystal. The behaviour of diffraction efficiency for a single picosecond pulse and a train gives information on the change in the refractive index due to one electron-hole pair, absorption cross-section, Auger-recombination coefficient and temperature derivative of the refractive index. (20 refs.)

75607 A review of holographic nondestructive evaluation at Lawrence Livermore National Laboratory. D.M.Boyd (Engng. Sci. Div., Lawrence Livermore Nat. Lab., California Univ., Livermore, CA, USA).

In book: *International advances in nondestructive testing*. Vol.9, W.J.McGonagle [Ed.], p.159-76. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

At Lawrence Livermore National Laboratory two holographic facilities have been established for the technology transfer of holographic interferometry. A review is presented of the principles of holographic interferometry (HI) and the application of this technique to nondestructive evaluation. Simplified quantitative analysis using a coincident viewing and illumination optical arrangement is described. (18 refs.)

75608 Holographic nondestructive evaluation: status and future. G.Birnbaum (Office of Nondestructive Evaluation, NBS, Washington, DC, USA), C.M.Vest.

In book: *International advances in nondestructive testing*. Vol.9, W.J.McGonagle [Ed.], p.257-82. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The results and conclusions of an extensive review of the literature and practice of holographic nondestructive evaluation are reported. Although this technique has several technically unique features, and has been shown to be a feasible nondestructive testing technique in a very large number of laboratory investigations, its commercial application is rare. A counter example is its prevalent use in testing of aircraft and heavy equipment tires. The status of the technique is reviewed, recent and potential technical advances are enumerated, and suggestions of activities which would enable full realization and evaluation of the potential of holographic NDE in the future are made. 42.50 QUANTUM OPTICS

75609 Error optimization in the detection of level crossing through the measurement of $n^2(T)$. J.J.Sanz, M.A.Rebolledo (Dept. de Óptica y Estructura de la Materia, Univ. de Santander, Santander, Spain). *Appl. Opt. (USA)*, vol.22, no.10, p.1555-61 (15 May 1983).

Equations for calculation of the crossing point determination error and the signal width error in level-crossing experiments are generalized when the normalized second-order factorial moment of the fluorescence obtained is measured. To minimize the magnitude of these errors the authors study the behavior of these values on varying the magnetic field sweep interval, the counting time and the mean fluorescence intensity. (1 ref.)

75610 Superradiation of extended systems. A.V.Andreev, Yu.A.II'inskiĭ (M.V. Lomonosov Moscow State Univ., Moscow, USSR). *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.5, p.150-4 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.985-9 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981).

The effect of collective spontaneous emission or superradiation (SR) is currently described chiefly within the framework of two approaches: quantum and semiclassical. The semiclassical theories take account of the field nonuniformity along the length of the sample, but they do not describe the process of SR avalanche production and therefore require the introduction of extraneous sources of spontaneous noise or the stipulation of nonzero initial and boundary conditions. In [1981] the authors developed a quantum theory of SR, which takes account of the spatial variations of the field density. In the present work, a comparison is made between the results of the mode theory and space theory of SR. (6 refs.)

75611 Group-theory analysis of coherent effects in multilevel systems. V.P.Karasev, L.A.Shelenin (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR). *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.5, p.161-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.997-1003 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981).

A brief exposition is given of the foundations of a consistent group treatment of various generalizations of the Dicke model which take account of the multilevel nature and degeneration of the levels of individual radiators, as well as the relaxation processes along with the radiation processes. The results obtained allow on the one hand a generalization of the 'two-level' procedures to the n -level case, and on the other hand the substantial simplification of the calculations of the characteristic quantities of cooperative processes: the intensities, radiation-field correlation functions, various averages, etc. Note likewise that the proposed treatment is suitable not only for studying the interaction of matter with an electromagnetic field, but also the interaction of matter with boson fields (for example, acoustic fields). 42.52 MASERS

75612 Electron cyclotron maser interaction in an open resonator with slowly varying cross-section. Zhou Lezhu, Xu Chenghe (Dept. of Radio Electronics, Peking Univ., Peking, China). *Acta Sci. Nat. Univ. Pekin. (China)*, no.6, p.67-76 (1982). In Chinese.

On the basis of theory previously presented, the authors studied the cyclotron maser interaction between a cyclotron electron beam and the RF field in an open resonator with slowly varying cross-sections. Firstly, the general expressions for RF field in this open resonator are given and it is considered that the axial wave number of the RF field is variable. Then starting from the relativistic Vlasov equation of plasma dynamics, some analytical expressions for the beam-wave interaction have been derived. For arbitrary resonator geometry these results can be used to determine cyclotron maser interaction power, starting condition and other parameters. For the special longitudinal field profile, such as sine-profile they are in good agreement with the previous results. (10 refs.)

75613 Generation of electromagnetic waves during photochemical reactions. Yu.V.Glazkov, G.P.Shpen'kov, L.A.Khil'manovich. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.569-72 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.800-3 (May 1982). [received: Feb. 1983]

Reports a successful attempt to generate electromagnetic waves via the nuclear polarization effect using a resonance profile with an enhanced Q. (7 refs.)

42.55 LASING PROCESSES

75614 'Tunnel' locking stimulated Raman radiation components in an optical resonator. V.N.Lugovoi, A.L.Dyshko (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Opt. Acta (GB)*, vol.30, no.5, p.587-605 (May 1983).

Stimulated Raman radiation is considered in an optical resonator excited by an external light beam. It is assumed that the resonator is filled with a dispersive (condensed) medium for a length of the medium (along the resonator axis) close to several 'tunnel' lengths. A Raman-active medium is assumed to fill part of the resonator length along the resonator axis. Numerical calculations are presented of tunnel locking stimulated Raman radiation components. The shape of light pulses is calculated, and the band of locking Stokes components is derived. The feasibility of generating a light pulse of duration $3 \times 10^{-14} \times 10^{-15}$ s in a frequency region close to the point $\partial^2 n_{\text{eff}} / \partial \omega^2 = 0$, located usually in the infrared spectral region (n_{eff} is the effective refractive index of the substance inside the resonator) is discussed. Also

discussed is the feasibility of correcting the refractive-index dispersion and generating femtosecond light pulses in the visible spectral region. (36 refs.)

42.55B General theory of lasing action

75615 Space-time and space-averaged equations for a two-mirror laser: theory and numerical results. M.Baer, I.Last (Chem. Div., Soreq Nuclear Res. Centre, Yavne, Israel). *Appl. Opt. (USA)*, vol.22, no.10, p.1578-91 (15 May 1983).

A theoretical model is considered for an unsteady three-level (single-mode) laser. By use of the rotating wave approximation, the usual semiclassical equations are transformed into a system of first-order spacetime (ST) equations. The space oscillations of the population difference (hole-burning effects) and the motion of the atoms are included in the treatment. After the introduction of several assumptions, the ST equations are transformed to a set of time-dependent space-averaged (SA) equations. The numerical calculations were performed for a pulsed two-mirror laser with a finite phase memory decay constant and for resonance and nonresonance frequencies. The calculations show that the SA equations give almost the same results as the much more complicated ST equations. (25 refs.)

75616 Delay effect in laser amplifiers. F.Hopf (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.137-44 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982).

In the Stanford Free Electron Laser it is necessary to desynchronize the electron pulses from the accelerator with the light pulses. This effect is a major complication in the data analysis of the FEL. The author considers the desynchronization effect for a laser amplifier. The equations are substantially simpler than the FEL, and most of the results can be obtained analytically. Both the gain (linear) and saturation (nonlinear) regimes are investigated. (7 refs.)

75617 Photon statistics of an m -photon laser with k -photon losses. U.Herzog (Zentralinst. für Optik und Spektroskopie, Akad. der Wissenschaften, Berlin, Germany). *Opt. Acta (GB)*, vol.30, no.5, p.639-52 (May 1983).

With the help of an approximation scheme valid for $\bar{n} \gg 1$ and $\Delta n^2 \ll \bar{n}^2$ (where \bar{n} is the mean value and Δn^2 the variance of the photon number), the photon statistics of an m -photon laser with k -photon losses ($m, k = 1, 2, \dots$) is studied theoretically for arbitrary values of the atomic population inversion s produced by an external pumping source. For $m > k$, $m = k$ and $m < k$, the dependences of the steady-state values of the mean photon number and of the quantity $\Delta n^2 / \bar{n}$ on gain and saturation are investigated. In the limit of strong saturation (well above the threshold for $m > k$) the photon statistics are characterized by the steady-state value $\Delta n^2 / \bar{n} = (1/2)(1 + m/k)$. (23 refs.)

75618 Asymptotically exact equations for the averages in the theory of laser systems. G.O.Balabanyan (Electronic Engng. Inst., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.543-4 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.314-17 (July 1982). [received: April 1983]

For laser models of the Dicke type, the author gives asymptotically exact (in the sense of the thermodynamic limit) equations, obtained by the method of ordered operators, for the averages of operators which depend only on the radiation variables. For two concrete models, he considers the solutions of these equations and their physical consequences. (10 refs.)

42.55D CO₂ lasers

75619 Dynamics of the CO₂ upper laser level as measured with a tunable diode laser. C.Dang, J.Reid, B.K.Garside (Dept. of Engng. Phys. & Phys., McMaster Univ., Hamilton, Ontario, Canada). *IEEE J. Quantum Electron. (USA)*, vol.QE-19, no.4, p.755-64 (April 1983).

A tunable diode laser (TDL) operating in the 2140-2310 cm⁻¹ wavenumber region is used to probe a conventional CW CO₂ laser discharge. Detailed vibrational populations in CO₂ are measured under lasing conditions, i.e., in the presence of an intense 10 μ m field. The TDL is also used to investigate the rate of recovery of the populations in a variety of vibrational levels after the passage of an intense 10 μ m pulse. The authors deal mainly with the behavior of the upper laser level, and the associated ν_3 mode. The authors show that electron deexcitation of the ν_3 mode is very important, and is responsible for the limitation of the ν_3 mode temperature observed previously. In typical gas mixtures, the ratio of the ν_3 mode electron deexcitation rate constant to the electron excitation rate constant is $\sim 3.5:1$. (30 refs.)

75620 Simultaneous quasisteady oscillation on 10.6 and 18.4- μ m transitions in a gasdynamic CO₂ laser. D.G.Bakanov, L.S.Kornienko, A.I.Odintsov, A.I.Fedoseev. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.901-4 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.233-6 (Aug. 1982). [received: April 1983]

Resonant action of laser IR emission is an effective means of selectively exciting vibrational levels and energy transfer between different modes of polyatomic molecules. In inverted media it is possible to use induced 'dropping' of molecules from excited levels to low levels, with the concomitant amplification or generation of radiation. In a system of anharmonic oscillators in which the time of interaction of the molecules with the radiation greatly exceeds the characteristic V-V exchange time, but is less than the V-T relaxation time, the 'warming up' of the vibrational mode can lead to the formation of quasi-equilibrium distributions with inversion between particular vibrational-rotational levels. In this case the optical pumping channel need not be directly connected with the upper level of the inverted transition. The authors report the observation of simultaneous oscillation on the 00⁰1-10⁰0 ($\lambda = 10.6 \mu$ m) and 03⁰10-10⁰0 ($\lambda = 18.4 \mu$ m) transitions in a quasisteady gasdynamic CO₂ laser. The role of 10.6- μ m emission in pumping the coupled modes (ν_1 and ν_2) of the CO₂ molecule and the formation of inversion on the 18.4- μ m transition is discussed. (9 refs.)

42.55F Inert gas lasers

75621 Short wavelength laser calculations for electron pumping in neon-like krypton (Kr XXVII). U.Feldman (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA), A.K.Bhatia, S.Suckewer. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2188-97 (May 1983). The authors present calculations of electron impact collision strengths and spontaneous radiative decay rates for neon-like krypton (Kr XXVII) for the $2s^2 2p^6$, $2s^2 2p^5 3s$, $ss^2 2p^3 3p$, and $2s^2 2p^5 3d$ configurations. From these atomic data the level populations as a function of the electron density were calculated at two temperatures ($T_e = 1 \times 10^4$ K and $T_e = 3 \times 10^4$ K). The analysis of level populations shows that a volume of krypton in which a significant number of the ions are in the Kr XXVII degree of ionization can produce a significant gain in transitions between the $2s^2 2p^5 3s$ and $2s^2 2p^5 3p$ configurations. At an electron density of 1×10^{19} cm⁻³ the plasma length has to be on the order of 1 m; at a density of 1×10^{21} cm⁻³ the length is reduced to about 0.5 cm; and at an electron density of 1×10^{22} cm⁻³ the length of the plasma is further reduced to about 1 mm. (18 refs.)

42.55H Lasing action in other gas lasers

75622 Parameter regimes for X-ray lasing in plasmas. R.C.Elton (Naval Res. Lab., Washington, DC, USA). *Comments At. & Mol. Phys. (GB)*, vol.13, no.2, p.59-67 (1983). A straightforward physical analysis is used to define the limiting electron density as a function of temperature, concentration and dimensions for generating population inversion and gain in a hydrogenic plasma of varying nuclear charge Z . A suitable parameter regime bounded by electron collisional mixing and radiative trapping of resonance radiation is defined. Good agreement is found with an established rate equation numerical model. The importance of a minimal ground state density is emphasized by the results. (23 refs.)

75623 Wavelength selectivity with metal halide lasers. I.Liberman, S.G.Leslie (Westinghouse Res. & Dev. Center, Pittsburgh, PA, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.335, p.48-51 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).

Metal halide excimer lasers promise to be an efficient source of high power laser energy in the visible and near infrared. Based on extensive work on the HgBr laser one can expect that the nine lasers based on the group 2B metals (Zn, Cd, Hg) and the halides (Cl, Br, I) can each be tuned over a 100 Å region. By using these lasers to pump hydrogen isotope Raman cells, a significant portion of the visible and near infrared can be accessed with practical gas laser sources. (6 refs.)

75624 Nuclear pumped $O_2(^1\Delta)$ -I₂ laser. G.H.Miley, M.S.Zediker (Fusion Studies Lab., Univ. of Illinois, Urbana, IL, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.335, p.109-15 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).

Neutrons from a pulsed Training Research Isotope Products General Atomics (TRIGA) research reactor are used to create nuclear reactions in a boron coating on the wall of an irradiation chamber that surrounds flowing oxygen. This generates high-energy ions that interact with the oxygen, producing the long-lived metastable, $O_2(^1\Delta)$. Current experiments use 1 to 5 Torr of O_2 in 100 to 200 Torr of Ar carrier gas. The 1.27-μm emission from $O_2(^1\Delta)$ is monitored 8 meters from the excitation region and nearly 1 second after the reactor pulse (—10 msec wide). Results to date indicate $O_2(^1\Delta)/O_2(^3\Sigma)$ fractions obtained are well above the 17% required to invert iodine in a flowing transfer laser. The $O_2(^1\Delta)$ -I₂ laser is of particular interest as a candidate driver for an inertial-confinement fusion reactor. Since energy coupling between the pellet and driver occurs directly through neutrons, relatively high system efficiencies appear possible. Further, the long-lived $O_2(^1\Delta)$ state provides the energy storage time (fractions of a second) needed between pellet implosions. (13 refs.)

75625 Laser based on vapors of complex molecules with self-pumping of the active medium. N.A.Borisovich, V.A.Tolkachev, V.Ya.Tulach, M.K.Khitrun. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.881-5 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.209-14 (Aug. 1982). [received: April 1983]

One of the favorable qualities of lasers based on vapors of complex molecules is the low density of the active medium and the concomitant small thermooptic losses and the low viscosity. Measurements of the rate of mode scanning in frequency caused by variation of the optical cavity length due to changes in the properties of the active medium with laser pumping as well as the efficiency of diffraction and self-diffraction by the optically induced spatially periodic grating have shown that the refraction effects in vapor lasers are an order of magnitude smaller than in lasers based on solutions, and have a resonant nonthermo-optic nature. The authors have carried out a comparison of the beam divergence of vapor and solution lasers. (12 refs.)

75626 Optimizing the lasing efficiency of a POPOP vapor laser. V.A.Povedailo. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.888-92 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.217-23 (Aug. 1982). [received: April 1983]

The author has carried out calculations and experiments relative to optimization of the output power and pulse duration of a POPOP vapor laser. The calculation is based on a model developed previously, taking into account the temperature dependence of the vibrational heat capacity of the active molecules and the buffer gas. In the numerical solution, the temperature dependence of the heat capacity was approximated by a simplified expression based on a model of identical vibrational oscillators. (14 refs.)

75627 Single-mode operation of Doppler-broadened lasers by injection locking. R.W.Dunn, S.T.Hendow, W.W.Chow, J.G.Small (Inst. for Modern Optics, Univ. of New Mexico, Albuquerque, NM, USA). *Opt. Lett. (USA)*, vol.8, no.6, p.319-21 (June 1983). A multimode He-Ne laser can be forced to oscillate in a single mode by injecting a narrow-band signal into the resonator. The authors show experimentally that the minimum injected intensity required for single-mode operation occurs at an injection frequency detuned from line center. This is in agreement with the results from a semiclassical theory of an inhomogeneously broadened injection-locked laser. (6 refs.)

75628 New applications of CO lasers. E.A.Gavronskaya, M.I.Zinchenko, S.N.Leonov, R.A.Liukonen. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1409-10 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2292-4 (Nov. 1982). [received: May 1983] Reports findings concerning simultaneous lasing from a CO laser in the 5 and 10 μm regions achieved by suitably selecting the components in the active medium. Simultaneous lasing was first unsuccessfully attempted by Sequin et al. (1972); however, it was found that the CW lasing power at 5 or 10 μm depends on the amount of CO and CO₂ in the active medium. (6 refs.)

42.55M Lasing action in liquids and organic dyes

75629 Coherence effects in synchronously pumped mode-locked dye lasers. L.W.Casperson (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2198-208 (May 1983). A formalism is developed for describing the evolution of picosecond mode-locked pulses in synchronously pumped dye lasers. The finite phase memory of the molecular wave functions is included, and it is found that the resultant coherence effects can be dominant for operation close to exact synchrony. Considerations of the isotropic molecular orientational distribution and the finite vibrational relaxation times are also essential in obtaining quantitative agreement with experimental results. (25 refs.)

75630 Effect of a thermal lattice on the generated line width of a dye laser with distributed feedback. A.A.Afanasyev, V.A.Batyrev, M.V.Korol'kov. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.899-901 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.230-3 (Aug. 1982). [received: April 1983]

The paper is concerned with estimating the contribution of a nonstationary thermal grating to the width of a DF laser line. The authors examine a laser with dynamic DF formed in the active medium by an interference coherent pumping field. In the active medium of such a laser, together with the resonance grating, thermal and nonresonance gratings of another type can be efficiently excited. The time for establishing the thermal grating τ_T is usually much greater than the resonant time and can be comparable to the pumping pulse duration. For this reason, the contribution of the thermal grating to DF can vary during the generation process, which according to linear theory must be accompanied by a change in the characteristic frequencies and threshold pumping powers of the DF laser. They estimate the change in frequency related to the development of the thermal grating from the conditions of self excitation of the DF laser, assuming that the time τ_T is much greater than the time for establishing the generation process. With this assumption, the generation process is quasistationary and, therefore, the spectrum of characteristic frequencies and the threshold pumping power of the DF laser can be determined. (10 refs.)

75631 The lasing characteristics of solutions of rhodamine 6G and coumarin 47 with inhomogeneously broadened spectra. A.I.Akimov, L.V.Levshin, A.M.Saetskii, V.I.Yuzhakov.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.904-8 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.236-41 (Aug. 1982). [received: April 1983]

The lasing efficiency of dyes depends not only on the structure of their molecules, but also on the addition to the solutions of substances that affect their spectral and luminescent properties, particularly additives that enhance the inhomogeneous broadening (IB) of the electronic spectra. The authors study the effect of such additives on the spectral and power characteristics of the lasing of alcoholic solutions of the dyes rhodamine 6G and coumarin 47. (11 refs.)

75632 Longitudinal mode characteristics for 1.3 μm GaInAsP/InP DFB lasers just below the threshold current. H.Okuda, J.Kinoshita, Y.Hirayama, Y.Uematsu (Toshiba Corp., Kawasaki, Japan).

Electron. Lett. (GB), vol.19, no.10, p.362-3 (12 May 1983). The stopband and the Bragg wavelength in a DFB laser clearly observed by measuring longitudinal mode characteristics just below the threshold current. It became clear that the first-order longitudinal mode oscillation did not always occur. Coupling coefficients K for the DFB laser were deduced to be 10 to 40 cm⁻¹ from the stopband width. (5 refs.)

75633 Simple formulas giving temperature profiles in active layer of stripe geometry laser diode without oxide barriers. W.Nakwaski (Inst. of Phys., Tech. Univ. of Lodz, Lodz, Poland).

Electron. Lett. (GB), vol.19, no.10, p.368-709 (12 May 1983). The simple, approximated formulas describing the temperature distribution in the active layer of the stripe geometry laser diode without oxide barriers have been derived by the author. (7 refs.)

75634 Degradation mechanism in 1.3 μm InGaAsP/InP buried crescent laser diode at a high temperature. E.Oomura, H.Higuchi, R.Hirano, Y.Sakakibara, H.Namizaki, W.Susaki.

Electron. Lett. (GB), vol.19, no.11, p.407-8 (26 May 1983). A leakage current flowing through a junction between a p-InP current blocking layer and an n-InP cladding layer is examined in connection with a degradation of a buried crescent laser diode at a high temperature. The degradation characteristics have been successfully explained by a theoretical model proposed in this study. (4 refs.)

75635 1.5 μm wavelength GaInAsP C³ lasers: single frequency operation and wideband frequency tuning. W.Tsang, N.A.Olsson (Bell Labs., Murray Hill, NJ, USA), R.A.Linke, R.A.Logan.

Electron. Lett. (GB), vol.19, no.11, p.415-17 (26 May 1983). The authors have characterised the temporal-spectral behaviour of 1.5 μm wavelength cleaved-coupled-cavity (C³) lasers. Single longitudinal mode discrimination ratios in excess of 300:1 are obtained under high bit rate modulation. Bit error rate of less than $\leq 10^{-7}$ are obtained under single-frequency operation with direct modulation up to 1 Gbit/s. Averaged frequency tuning rates as large as 26 Å/ma and frequency tuning excursion of 300 Å are

achieved when the C^3 laser is operated in a frequency modulation mode. (5 refs.)

75636 High-output room-temperature pulsed operation for broad contact InP/In_{0.53}Ga_{0.47}As/InP lasers grown by molecular beam epitaxy. R.K. DeFreez, R.A. Elliott, J.S. Blakemore (Oregon Graduate Center, Beaverton, OR, USA), B.I. Miller, J.H. McFee, R.J. Martin. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2177-82 (May 1983). Operating characteristics are described for broad contact double-heterostructure (DH) lasers grown by molecular beam epitaxy (MBE), with In_{0.53}Ga_{0.47}As active layers lattice matched to InP. These were operated at $T \approx 293K$, with (low duty cycle) pulses of current from 1.5 to $3I_0$. The lowest threshold current density, $J_{th} \approx 2800 A/cm^2$, is some 40% higher than an ideal cavity expectation. Under these strong pulse conditions, a multimode output was observed, with pronounced spatially filamentary characteristics. The output was plane polarized perpendicular to the active layer, indicative of TM mode dominance. This nontypical polarization, considered in conjunction with an indicated trend of external differential quantum efficiency increasing with length, is consistent with polarization-selective internal losses or polarization-dependent gain as the mode-controlling feature, rather than facet reflection losses. (51 refs.)

75637 Low-current-threshold (GaAl)As visible lasers with emission wavelengths below 750 nm. T. Hayakawa, S. Yamamoto, H. Hayashi, N. Miyauchi, S. Yano, T. Hijikata (Central Res. Labs., Sharp Corp., Nara, Japan). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2209-13 (May 1983). Low-current-threshold behaviour of (GaAl)As v -channeled substrate inner stripe lasers emitting below 750 nm is presented. The variation of the threshold current of these devices with the lasing wavelength agrees with that of $1/\eta$, calculated using the energy-band parameters where the indirect-direct crossover is assigned at the AlAs mole fraction of 0.45. CW operation was achieved at as short as 688 nm. These performances result from the improved laser properties by growing the Te-doped cladding layer on top of the active layer using the p -type GaAs as a substrate. (32 refs.)

75638 Majority carrier concentration and quasi-Fermi level for Pb_{1-x}Sn_xTe DH diode lasers. D. Dadarlat, R.M. Candea, M. Barlea (State Committee for Nuclear Energy, Inst. of Isotopic & Molecular Technol., Cluj-Napoca, Rumania). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K61-5 (16 March 1983). The authors make some quantitative considerations on the majority carrier concentration and on the quasi-Fermi level for PbSnTe DH diode lasers, assuming a degenerate regime for the holes. The case of a very small energy gap, $E_g < Q_p$, is also analysed. (4 refs.)

75639 Pressure induced polarization ellipticity in injection lasers. N.B. Patel, M.B.Z. Morosini, T.J.B. Serra, J.E. Ripper (Inst. de Fisica 'Gleb Wataghin', Univ. Estadual de Campinas, Campinas, Brazil). *Rev. Bras. Fis. (Brazil)*, vol.12, p.51-9 (March 1982). [received: April 1983] Departure from linear polarization of laser modes was observed to be induced by applied uniaxial stress. The induced polarization ellipticity was observed to be independent of injection current but a function of applied stress and of the individual laser. Nonzero ellipticity was observed in some lasers even at threshold. (8 refs.)

75640 Interface states and current threshold of GaAs/Al_xGa_{1-x}As double-heterostructure lasers grown by molecular beam epitaxy. C.S. Hong, W.I. Wang (Rockwell Internat., Microelectronics Res. & Dev. Center, Thousand Oaks, CA, USA). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.297-302. A comparative study of the luminescence efficiency of Al_xGa_{1-x}As, GaAs, and GaAs/Al_xGa_{1-x}As heterojunctions grown at different temperatures has been performed to determine the factors that influence the current threshold of GaAs/Al_xGa_{1-x}As double heterostructure lasers grown by molecular beam epitaxy (MBE). The quality of Al_xGa_{1-x}As confinement layers is found not to influence the threshold current density of MBE-grown lasers. The mechanism that influences the current threshold is found to be the traps at the GaAs/Al_xGa_{1-x}As interface as resulted from the irregular surface of the low temperature grown Al_xGa_{1-x}As. The possible influence of the results on the role of MBE in integrated optics is discussed. (10 refs.)

75641 AM and FM quantum noise in InGaAsP lasers. Y. Yamamoto, T. Mukai (Mushashino Electrical Communication Lab., NTT, Tokyo, Japan). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.311-16. Four different theoretical formulations for AM and FM quantum noise properties in semiconductor lasers are compared with each other for InGaAsP lasers. These formulations are based on van der Pol, Fokker-Planck, rate, and photon density matrix equations. Experimental AM and FM quantum noise properties for InGaAsP BH laser emitting at 1.3 μ m show good agreement with theoretical predictions. (11 refs.)

75642 Luminescence of laser crystals. Yu.K. Voron'ko, V.V. Osiko, I.A. Shcherbakov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR). *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.5, p.134-43 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.970-8 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981). A method is developed for performing quantitative investigations of the processes of the transformation of the electron-excitation energy into a group of optically active centers which interact with one another and with a field of external radiation. As an example of the experimental verification of this method, the authors present results obtained for a YAG-Cr³⁺, Nd³⁺ crystal. The Cr³⁺ ions served as energy donors, and the Nd³⁺ ions served as acceptors. The concentration of the former amounted to 1.2 at.% ($1.7 \times 10^{20} \text{ cm}^{-3}$); the concentration of the latter amounted to 0.63 at.% ($0.9 \times 10^{20} \text{ cm}^{-3}$). Energy transfer, according to the data of Kiss et al. [1964], is accomplished from the ²E state of the chromium ions to the ⁴F_{3/2} state of the neodymium ions. The times for relaxation from the absorption bands of Cr³⁺ to the metastable state ²E and from the absorption bands of the Nd³⁺ ions to the metastable state ⁴F_{3/2} greatly exceed all other characteristic times. (23 refs.)

75643 Transition rates of Tb³⁺ in TbP₃O₁₄, TbLiP₄O₁₂, and TbAl₃(BO₃)₄: an evaluation for laser applications. S. Colak, W.K. Swicker (Philips Labs., Briarcliff Manor, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2156-66 (May 1983).

The properties of Tb³⁺ in crystals of three stoichiometric Tb compounds, namely TbP₃O₁₄, TbLiP₄O₁₂, and TbAl₃(BO₃)₄ have been studied by spectroscopic absorption and emission methods to evaluate these materials as hosts for Tb³⁺ laser applications. The absorption spectra between 50000 and 2000 cm^{-1} at 300K, the emission spectra between 27000 and 14000 cm^{-1} at 300K, and the fluorescence decay characteristics of ³D₄ emission at 300 and 5K are given. Because of cross relaxation, the ³D₃ and ³G₅ emissions in all three materials were concentration-quenched strongly with a similar behavior observed in other hosts. Quenching in the ³D₄ states was negligible except for TbAl₃(BO₃)₄ where moderate quenching was observed due to energy transfer to nonradiative traps. Transition rates between various states were calculated by using the Judd-Oftel approach and a first order wavefunction set, and good fit was obtained between the calculated and experimental parameters. The transition rates were then used to find the emission cross sections of various lines. (72 refs.)

75644 Evaluation of the thermal focal length produced in a repetitively pulsed solid-state laser. Hou Jing-ya (Laser Lab., HuaZhong Inst. of Technol., Wuhan, China). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2214-18 (May 1983).

An approximate expression for the focal length of the thermal lens produced in a repetitively pulsed laser rod is presented. Numerical evaluations reveal relations between thermal focusing and the rod radius, cooling conditions, pulse repetition rate, and nonuniformity of pumping. The aberration produced under different operating conditions is also discussed. A critical rod radius is identified for which the thermal lens effect is most sensitive to cooling and nonuniformity of pumping. (5 refs.)

75645 Crystalline KGd(WO₄)₂ laser with a semiconductor pump system. I.S. Galkin, A.L. Zakegim, V.M. Markonov, V.M. Nikolaev, A.A. Pavlyuk, I.P. Petrovich, V.Yu. Petrun'kin, A.P. Shkadarevich, V.D. Yarzhenkovskii. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.886-8 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.215-17 (Aug. 1982). [received: April 1983]

The authors report a study of a model of a laser with light diode pumping based on a crystal of KGd(WO₄)₂:Nd³⁺. KGd(WO₄)₂ crystals may be produced with rather large dimensions (close to YAG) and attain activator concentrations (up to 10 at.%) higher than those attainable in YAG. (6 refs.)

75646 A ruby laser in an electron beam field. M.R. Bedilov, Kh.B. Beisembayeva, P.K. Khabibullaev, R.P. Saidov. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.4, p.607-8 (April 1983). In Russian. Studies the working of ruby lasers and lasers based on glass: Nd³⁺ in electron beam fields with doses of $D = 10^{11}$ - 10^{14} electron/cm². It is found that the changes in the laser generating characteristics strongly depend on D and irradiation conditions, as well as on the nature of the active elements. (4 refs.) V.G.P.

42.55T Free electron lasers

75647 Effects of space charge on the performance of an orotron. R.P. Leavitt, D.E. Wortman (US Army Electronics Res. & Dev. Command, Harry Diamond Labs., Adelphi, MD, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2830-1 (May 1983).

The authors consider the effects of mutual electronic repulsion in the electron beam in the orotron, based on the general analysis of Gover and Sprangle

- [IEEE J. Quantum Electron. QE-17, 1196 (1981)]. The theory of orotron operation is extended to include space-charge effects, and calculations are made to determine starting current, output power, and efficiency. Results of the calculations are in good agreement with available experimental results at low (~ 6.7 A/cm²) beam current densities. The theory predicts that an output power of 264 W CW may be obtainable at 75 GHz with a beam current density of 50 A/cm². (9 refs.)
- 75648 Preliminary results of the Adone storage ring FEL experiment.** LELA. R.Barbini (Lab. Nazionali di Frascati, INFN, Frascati, Italy), G.Vignola, S.Trillo, R.Boni, S.De Simone, S.Faini, S.Guiducci, M.Pregger, M.Serio, B.Spataro, S.Tazzari, F.Tazzioli, M.Vescovi, A.Cattoni, C.Sanelli, M.Castellano, N.Cavallo, F.Cevenini, M.R.Masullo, P.Patteri, R.Rinzivillo, A.Cutolo, S.Solimeno. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.1-10 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Gives a short description of the LELA (Free Electron Laser on Adone) experiment. Results on the spontaneous radiation angle and energy spectra and preliminary results on optical gain measurements are also discussed. (8 refs.)
- 75649 Pulse propagation in free electron lasers.** W.B.Colson (Quantum Inst., Univ. of California, Santa Barbara, CA, USA), A.Renieri. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.11-27 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The main features relevant to pulse propagation in free electron lasers are discussed, together with a comparison to the Stanford oscillator experimental data. (37 refs.)
- 75650 Recent results of the ACO storage ring FEL experiment.** M.Billardon (Ecole Supérieure de Phys. et Chimie, Paris, France), D.A.G.Deacon, P.Elleau, J.M.Ortega, K.E.Robinson, C.Bazin, M.Bergher, J.M.J.Madey, Y.Petroff, M.Velghe. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.29-71 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). A permanent magnet undulator has been built and installed on the ACO Storage Ring. The undulator design, the spontaneous emission and gain of the system, as well as the laser induced bunch lengthening of the electron bunch, are presented. A low-loss optical cavity has recently also been built and operated on the ring. Its performance and the degradation problems of the mirrors are discussed. Amplification of the spontaneous emission stored in the optical cavity has been observed. Also, preliminary results on the operation of an optical klystron are reported and interpreted. (29 refs.)
- 75651 Status of the MSNW tapered-wiggler FEL experiment.** J.M.Slater (Math. Sci. Northwest Inc., Bellevue, WA, USA), J.Adamski, D.C.Quimby, T.L.Churchill, L.Y.Nelson, R.E.Center. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.73-83 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Describes an experimental investigation of basic aspects of the tapered-wiggler free-electron laser. The effect of the FEL interaction on the electron energy distribution has been measured in a simple single pass amplifier configuration, with electrons and photons making a single pass through the tapered wiggler. A peak electron energy loss of about 9 percent and a net loss of 2.5 percent have been observed. (10 refs.)
- 75652 Theory of gain expanded free electron lasers.** N.M.Kroll, M.N.Rosenbluth (Univ. of California, San Diego, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.85-107 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). A linearized theory for two dimensional wigglers of a general form is developed, and an extension of the Madey gain-spread theorem is obtained to include transverse excitation. The storage ring operation of such structures in the quasi-linear regime is analyzed. For the gain expanded case it is found that the laser radiation is subject to the same limitation as has been found in the one dimensional case, namely that it is at most of the order of the product of the synchrotron radiation and the fractional energy aperture. (16 refs.)
- 75653 High-efficiency free-electron laser results.** K.Boyer, C.A.Brau, B.E.Newnam, W.E.Stein, R.W.Warren, J.G.Winston, L.M.Young (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.109-117 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Results obtained with a tapered-wiggler free-electron laser show deceleration of electrons by as much as 7%, and extraction of more than 3% of the total electron-beam energy as laser energy. (3 refs.)
- 75654 The Brookhaven free electron laser experiment.** S.Krinsky, A.Lucio, C.Pellegrini, A.van Steenberg, L.H.Yu (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.113-14 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Summary form only given, as follows. Reports on the status of the free electron laser experiment at Brookhaven with a description of the permanent undulator already built and ready to be installed on the VUV storage ring. (no refs.)
- 75655 TRW free electron laser experiment.** C.Shih, G.R.Neil, J.Munch, S.Fornaca, J.A.Edighoffer, M.Z.Caponi, H.E.Boehmer (TRW, One Space Park, Redondo Beach, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.115-23 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The details of the TRW free electron laser experiment at Stanford are presented. (no refs.)
- 75656 FEL quantum aspects.** G.Dattoli, A.Renieri (ENEA, Dipartimento Tecnologie Intersectoriali di Base, Centro Ricerche Energia Frascati, Frascati, Roma, Italy). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.125-36 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Reviews the main aspects of FEL quantum analysis in the framework of the Hamiltonian representation, both from the group theory point of view and from the dynamical one. Finally the authors point out how the formalism must be implemented in order to obtain results useful for future experimental tests. (20 refs.)
- 75657 Free electron laser oscillator startup analysis.** P.Sprangle, C.M.Tang, I.Bernstein (Naval Res. Lab., Washington, DC, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.145 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Summary form only given, as follows. An analysis of the free electron laser (FEL) oscillator startup problem is presented. The model is spatially one-dimensional though many important three-dimensional effects are heuristically included. The electron beam consists of pulses of arbitrary shape and are mono-energetic with no spread in either the longitudinal or transverse velocities. The wiggler parameters are taken to be fixed. Finally the analysis is carried out in the low gain, small signal regime. (no refs.)

- 75658 Simulation of isochronous storage ring free electron laser.** A.Gaupp (Freie Univ. Berlin, Berlin, Germany). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.147-51 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). A one dimensional simulation of a free electron laser in a storage ring operating close to isochronism is performed for a set of parameters to match the free electron laser proposal for the Berlin storage ring BESSY. (9 refs.)
- 75659 Transverse optical klystrons: a feasibility experiment on harmonic generation.** R.Coisson (Istituto di Fisica, Univ. di Parma, Parma, Italy), F.De Martini. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.163-6 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The authors indicate some measurements proposed to study (in the visible and near UV) the possibility of producing harmonics by a '(transverse) optical klystron'. (11 refs.)
- 75660 Electron laser facility (ELF) at the LLNL ETA.** D.Prosnitz (Lawrence Livermore Nat. Lab., Livermore, CA, USA), A.M.Sessler, K.Halbach, D.B.Hopkins, A.C.Paul, G.D.Stover, J.T.Tanabe, J.S.Wurtele. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.167 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Summary form only given, as follows. A high gain MM wave tapered wiggler free electron laser (FEL) amplifier has been designed and is under construction at Lawrence Livermore National Laboratory. The 5 MeV experimental test accelerator (ETA) is used as the electron source. The ELF design is presented, along with predicted performance, at 2, 4 and 8 mm. (no refs.)
- 75661 Application of transverse gradient wigglers in high efficiency storage ring FELs.** J.M.J.Madey (High Energy Phys. Lab., Stanford Univ., Stanford, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.169-78 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). A significant improvement in the power output, efficiency, and gain of storage ring free electron lasers (FELs) can be realized through the use of a gain-expanded wiggler. The design of such systems must emphasize energy acceptance, peak current, and emittance. Long (10 m) interaction lengths must also be provided. (11 refs.)
- 75662 The UK free electron laser.** M.W.Poole (SERC, Daresbury Lab., Daresbury, England), S.D.Smith. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.179-83 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). A UK free electron laser project has now been formally approved, based on the high power linear accelerator of the Kelvin Laboratory at East Kilbride, Scotland. Detailed design parameters of the system, centred on 10.6 μ m output radiation, are presented. The proposed experimental programme is briefly summarised and possible research applications are mentioned. (8 refs.)
- 75663 Linac technology for free electron lasers.** R.K.Cooper (Los Alamos Nat. Lab., Los Alamos, NM, USA), P.L.Morton, P.B.Wilson, D.Keefe, A.Faltens. *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.185-200 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Electron linear accelerator technology for high-power, short-wavelength free-electron lasers reviewed. The authors concentrate on the properties of high-energy electron linear accelerators for use in free-electron lasers operating principally in the Compton regime. To fix the focus somewhat, they consider electron energies in the 20- to 200-MeV range and consider requirements for high-power free-electron lasers operating in the 0.5- to 10- μ m range. Thus neither Cockcroft-Walton type accelerators nor pulsed-diode machines are discussed. (20 refs.)
- 75664 Storage ring design optimization for FEL operation.** H.Wiedemann (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.201-9 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The basic physics of electron storage rings and some limitations are discussed. For high beam current density and short damping times, the main limitation comes from the Touschek effect. However, peak currents of a few hundred amperes per bunch can be expected at a beam energy of 1 GeV, and more than one bunch should be filled in order to maximize the total free electron laser (FEL) power. (8 refs.)
- 75665 High current limitations on storage ring FEL sources.** J.L.Duff (Lab. de l'Accélérateur Linéaire, Univ. de Paris-Sud, Orsay, France). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.217-32 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Storage rings dedicated to free electron laser (FEL) sources must show good beam performances in order to obtain high gains. In particular bunch length, energy spread, beam intensity and transverse emittance have to satisfy special requirements. In order to appreciate the storage ring problems, the author briefly overviews twenty years of experience obtained with small and medium energy storage rings which were initially built as high energy physics facilities. The limiting effects and possible means to remedy the inconveniences are discussed. (29 refs.)
- 75666 Microtrons for free electron lasers.** S.Rosander (Dept. of Electron Phys., Royal Inst. of Technol., Stockholm, Sweden). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.233-7 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The various microtron types are shortly described and electron beam characteristics, relevant to FEL operation, of existing machines are given. Some possible lines of development are indicated. (12 refs.)
- 75667 Tapered wigglers.** S.A.Mani (W.J. Schafer Associates Inc., Wakefield, MA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.239-53 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The theory of the tapered wiggler free electron laser is reviewed. The analysis is based upon a one-dimensional Hamiltonian. The effects of finite beam emittance are discussed. Practical issues connected with realizing a tapered wiggler oscillator are enumerated with some proposed solutions. Finally, the operation of the tapered FEL as a high current, high gain amplifier is analyzed with implications of using an electron storage ring or induction accelerator as an electron beam source. (19 refs.)
- 75668 Stories of undulator light.** C.J.Elliott (Los Alamos Nat. Lab., Los Alamos, NM, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-1, p.255-87 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Optical details of free-electron lasers are reviewed including a layman's account of many of the ideas; a historical account of work over the last two years; a mathematical characterization of various schemes; a formulation of the mathematical problem as a non-linear fixed-point problem; and a description of computational techniques. (28 refs.)

75669 Quantum descriptions of free-electron lasers. W.Becker, J.K.McIver (Dept. of Phys. & Astron., Univ. of New Mexico, Albuquerque, NM, USA).

J. Phys. Colloq. (France), vol.44, no.C-1, p.289-311 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The various quantum mechanical descriptions of the free-electron laser are reviewed: (1) calculating the gain from the mismatch between the matrix elements for emission and absorption of a single photon, derived from the Dirac- or Klein-Gordon equation; (2) a multiphoton description based on the model of a constant current interacting with a quantized electromagnetic field; (3) solving the Klein-Gordon equation in the presence of both the laser and the wiggler taken as classical external fields, which gives a unified description of all operating regimes but spontaneous emission; (4) a fully quantized small-signal solution of the nonrelativistic many particle Bambi-Renieri Hamiltonian defined in a moving frame. This approach displays the difference between classical and quantum-mechanical fluctuations in the start up. (43 refs.)

75670 Free electron laser in the infrared: the experimental activity at the ENEA Frascati Centre. U.Bizzarri, F.Cioci, G.Dattoli, A.De Angelis, M.Ercolani, E.Florentino, G.P.Gallerano, T.Letardi, A.Marino, G.Messina, A.Renieri, E.Sabia, A.Vignati (ENEA, Dipartimento Tecnologie Intersettoriali di Base, CRE, Frascati, Roma, Italy).

J. Phys. Colloq. (France), vol.44, no.C-1, p.313-32 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). Describes the experimental activity aimed at the realization of a free electron laser operating in the spectral region 10 to 30 μm . The ENEA experimental activity is developing through three main stages: 1. Amplification experiment of a CW CO₂ laser beam, which will concern the analysis of the spontaneous and stimulated emission in a helical wiggler at $\lambda=10.6 \mu\text{m}$. 2. Oscillation experiment at $\lambda=32 \mu\text{m}$ and at higher harmonics, employing a variable gap linear wiggler. 3. Tunable operation of the FEL in the wavelength range 10 to 30 μm , employing the same wiggler and a new microtron with 35 MeV maximum energy. (7 refs.)

75671 Optical klystrons. P.Elleau (Dept. de Physico-Chimie, CENS, Gif-sur-Yvette, France).

J. Phys. Colloq. (France), vol.44, no.C-1, p.333-52 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). The optical klystron is a modification of the undulator which can be used to improve the gain in a free electron laser. Spontaneous emission and gain are theoretically studied as functions of electron energy and wavelength. Several effects limiting the gain enhancement are calculated: energy spread, angular spread, beam dimensions. The author briefly discusses how one can use the electron beam bunching generated by the optical klystron to emit coherent synchrotron radiation. (49 refs.)

75672 Review of recent experimental results from the Stanford 3 μm free electron laser. S.Benson, D.A.G.Deacon, J.N.Eckstein, J.M.J.Madey, K.Robinson, T.I.Smith, R.Taber (High Energy Phys. Lab., Stanford Univ., Stanford, CA, USA).

J. Phys. Colloq. (France), vol.44, no.C-1, p.353-62 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982). New data has been taken on the Stanford free electron laser (FEL) with improved electron beam characteristics. For the first time the temporal structure of the optical pulses has been studied using optical autocorrelation techniques. The new data are compared and contrasted with earlier data. Several puzzling aspects of the previous data appear correlated with drifts in the spectrum and current of the electron beam. Autocorrelation results indicate nearly transform limited pulses which are shorter than expected at large values of the cavity length detuning. Experiments carried out to study the intrinsic second harmonic radiation and the effects of the superimposed solenoidal magnetic field on laser operation are also reported. (6 refs.)

75673 The nonlinear gain in the free-electron laser with a long wiggler. M.V.Fedorov (P.N. Lebedev Phys. Inst., Moscow, USSR). *Opt. Acta (GB)*, vol.30, no.5, p.669-72 (May 1983). The nonlinear gain of the free-electron laser with a long wiggler is derived, and the regimes of weak and strong saturation are investigated. (3 refs.)

75674 Ionization effects in a system of a free electron laser and a molecular medium. J.Guillory (Jaycor, Alexandria, VA, USA), H.Wilhelmsen. *Phys. Scr. (Sweden)*, vol.27, no.5, p.374-5 (May 1983). It is estimated that ionization of molecules by the electron beam is insufficient to cause background plasma densities that would dominate the beam effects. The pressure of molecular gas for optimum coupling of FEL and molecular medium is of the order of 10^{-6} torr for beam densities of 10^9 cm^{-3} . (5 refs.)

75675 A new mechanism of excitation of a diffraction-radiation generator (free-electron laser). Yu.I.Evdokimenko, K.A.Lukin, I.D.Revin, B.K.Skrýnnik, A.V.Shestopalov (Sci.-Res. Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.554-6 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.318-21 (July 1982). [received: April 1983]

The authors consider the case of excitation of the TEM_{01q} mode in the open resonator; this mode is called the first mode of the open resonator of the diffraction-radiation generator-free-electron laser. The spatial structure of the mode is such that there are two field spots along the direction of electron motion and the total phase of the oscillations at these spots differ by π . (5 refs.)

42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

75676 Progress in glass components for neodymium lasers. G.Dube (Schott Optical Glass Inc., Duryea, PA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.10-14 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982). Describes some of the recent progress in glass materials used to generate, control, and attenuate Nd: laser light. Technical and manufacturing developments for phosphate laser glasses, large monolithic apodizers, high damage threshold AR treated glasses, filters, and other elements will be presented. (5 refs.)

75677 1.73 μm eyesafe laser rangefinder. M.Knights, J.Kuppenheimer, E.Chicklis (Defensive Systems Div., Sanders Associates Inc., Nashua, NH, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.83-4 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982). The ocular hazards associated with high peak power laser rangefinders can be avoided in systems which emit in the spectral range $\lambda > 1.4 \mu\text{m}$. The authors describe the operation of a 1.73 μm laser in erbium-doped lithium yttrium fluoride (Er³⁺:YLF) and discuss two ranging systems which utilize this 1.73 μm laser source. (no refs.)

75678 Progress in slab geometry solid state lasers. J.M.Eggleson, T.Kane, K.Kuhn, R.L.Byer (Appl. Phys. Dept., Stanford Univ., Stanford, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.104-8 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982). A slab geometry, with a zigzag totally internally reflected optical path, significantly reduces thermal focusing, stress induced biaxial focusing and birefringence in a solid state laser host. The authors present results of a theoretical and experimental study of slab geometry Nd:Glass and Nd:YAG laser systems. (12 refs.)

75679 Optimizing the efficiency of lasers with passive shutters. S.A.Mikhonov, A.N.Khodinskii, V.A.Kononov.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.896-9 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.227-30 (Aug. 1982). [received: April 1983] Starting from the principles for calculating laser parameters, the authors propose simple approximate expressions for calculating the optimal transmission of the output reflector and shutter, corresponding to maximum laser efficiency. The results of the calculations are experimentally checked for lasers based on neodymium ions with shutters based on F₂⁻ color centers in lithium fluoride. (5 refs.)

75680 Mirrors that are electron transparent for use in free-electron-laser oscillators. J.H.McAdoo (Sachs/Freeman Associates Inc., Bowie, MD, USA), V.L.Granatstein.

Opt. Lett. (USA), vol.8, no.6, p.316-18 (June 1983). The surface motion of gold-coated Mylar pellicle was measured interferometrically while the pellicle was subjected to bombardment from a 15-MeV, 40-mA pulsed electron beam. No surface motion as large as 0.3 μm was observed during the electron pulse. A radiation dose of 5×10^7 rad did not damage the surface. The results show that this foil can be used as an end mirror in free-electron-laser oscillators. (13 refs.)

75681 Generation of ultrashort pulses in a dye laser with light-induced distributed feedback and a high repetition rate. A.N.Rubinov, Yu.Slovenas, I.Chesnulavichyus, T.Sh.Efendiev (Phys. Inst., Acad. of Sci., Minsk, Belorussian SSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1408-9 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2290-2 (Nov. 1982). [received: May 1983] Tunable ultrashort laser pulses can be used to directly study the time behavior of ultrafast light-induced processes in materials. The authors' method for obtaining ultrashort laser pulses with an adjustable spectrum involves using light-induced distributed feedback. Such lasers are simpler, more stable, and easier to work with than other types of mode-locked dye lasers. The authors report measurements of the emission characteristics of a dye laser with light-induced distributed feedback operating at a high duty cycle with pulse durations in the picosecond range. They show that the pulse duration from a distributed feedback laser can be reduced by decreasing the total length of the periodic structure and by delaying the interfering pump pulses relative to one another. The authors also report generation of unprecedentedly short pulses (of picosecond duration) using a distributed feedback dye laser. (3 refs.)

42.60B Design of specific laser systems

75682 Laser performance of Nd:YLF. J.C.McCarthy, M.G.Knights, E.P.Chicklis (Defensive Systems Div., Sanders Associates Inc., Nashua, NH, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.2-4 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982). Flashpumped, Q-switched performance of Nd:YLF is reported in both single and multimode operation. Approximately 400 mJ was extracted from a $1/4 \times 3.0$ inch Nd:YLF rod in a single, Q-switched pulse. (5 refs.)

75683 Recent technical advances in coaxial flashlamp-pumped high energy dye lasers. S.E.Neister (Phase-R Corp., New Durham, NH, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.335, p.36-47 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982). (11 refs.)

75684 Improved discharge uniformity for transverse radio frequency waveguide CO₂ lasers. G.A.Griffith (Teledyne Electronics, Newbury Park, CA, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.335, p.69-71 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).

Transverse RF waveguide lasers have demonstrated an undesirable nonuniform gas discharge related to the electrical transmission line properties of the optical waveguide structure. Laser efficiency has been increased over 4 times to 11% for a laser of electrical length in excess of $2/3 \lambda$ at 200 MHz by correcting the voltage standing wave pattern with periodic inductor shunts. Peak outputs of 8 Watts at 10% efficiency and peak efficiencies of 1% at 4.4 Watt output have been attained with sealed operation for a 21.6 cm device. (3 refs.)

75685 Miniature short-pulse Nd:YAG laser oscillator. E.D.Reed, E.G.Erickson (GTE Products Corp., Sylvania Systems Group-Western Div., Mountain View, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.78-82 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).

A miniature Nd:YAG laser oscillator has been demonstrated which uses pulse-slice cavity dumping to achieve optical pulses of 425 ± 50 picoseconds FWHM. (no refs.)

75686 Unique applications of alexandrite lasers. H.Samelson, J.C.Walling, D.F.Heller (Allied Corp., Electro-Optical Products, Mt. Bethel, NJ, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.85-94 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).

The fundamental principles underlying the 3- and 4-level laser operation of alexandrite are discussed and recent performance highlights are given. Applications in the fields of hole drilling, semiconductor processing, photochemistry and lidar are described. (9 refs.)

75687 0.81 μ m band AlGaAs/GaAs double channel planar buried heterostructure laser with large optical cavity. M.Ueno, H.Kawano, T.Furuse, I.Sakuma (Opto-Electronics Res. Labs., Nippon Electric Co. Ltd., Kawasaki-City, Japan).

Electron. Lett. (GB), vol.19, no.10, p.370-1 (12 May 1983).

0.81 μ m band AlGaAs/GaAs double channel planar buried heterostructure laser diodes with large optical cavity have been developed as light sources for use in analogue optical fibre communication systems. Linear light-output/current characteristics in a single longitudinal-mode spectrum at a modulation frequency $f=100$ MHz with modulation index $m=0.9$ have been attained. (9 refs.)

75688 New approach to the manufacture of low-threshold 1.5 μ m distributed feedback lasers. L.D.Westbrook, A.W.Nelson, C.Dix (British Telecom Res. Labs., Ipswich, England).

Electron. Lett. (GB), vol.19, no.11, p.423-4 (26 May 1983).

Low-threshold-current (85 mA), oxide isolated InGaAsP/InP distributed feedback (DFB) lasers operating at a wavelength of $\lambda=1.5 \mu$ m have been produced for the first time using electron-beam-written DFB corrugations overgrown by MOCVD. The control and flexibility afforded by these techniques considerably ease the complexity of DFB laser manufacture. (7 refs.)

75689 Low threshold photopumped AlGa_xAs quantum-well heterostructure lasers. R.D.Burnham, W.Streifer, D.R.Scifres (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), N.Holonyak, Jr., K.Hess, M.D.Camras. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2618-22 (May 1983).

Data are presented on very low threshold photopumped separate-confinement quantum-well heterostructure (SC QWH) lasers grown by metalorganic chemical vapor deposition (MOCVD). An unusually thin single quantum well (size $L_z \leq 60 \text{ \AA}$) is employed in the QWH with the carriers confined ('trapped') in the interior 'cladding' region, which serves also as the optical waveguide. Excess carriers, which are photogenerated (or injected), are confined in the thin interior cladding region (size $L_z \sim 1000 \text{ \AA}$) and, in this charge reservoir and waveguide region, are thermionically 'emitted' back and forth across the well until scattered to lower energy in the well ($\Delta E \sim \hbar\omega_0$) and collected. Continuous (CW) 300K photopumped laser operation of these QWHs is demonstrated for very short cavities. For one QWH wafer laser operation occurs at $\lambda \sim 7730 \text{ \AA}$ with a photopumping threshold of 380 W/cm^2 ($J_{th} \sim 160 \text{ A/cm}^2$) and for another wafer at $\lambda \sim 7000 \text{ \AA}$ with threshold 10^3 W/cm^2 ($J_{th} \sim 410 \text{ A/cm}^2$). The photopumped samples are as small as $20 \times 40 \mu\text{m}$, thus making these laser thresholds (for such short cavity lengths) a factor of 3-10 better than the lowest previously reported. (11 refs.)

75690 Spectrum studies on a GaAs-AlGaAs multi-quantum-well laser diode grown by molecular beam epitaxy. H.Iwamura, T.Saku, H.Kobayashi, Y.Horikoshi (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Co., Tokyo, Japan).

J. Appl. Phys. (USA), vol.54, no.5, p.2692-5 (May 1983).

Spontaneous and stimulated emission spectrum and the different characteristics between TE and TM polarizations were investigated on a GaAs-AlGaAs multi-quantum-well (MQW) laser diode grown by molecular beam epitaxy. The MQW laser lases at 38 meV below the photoluminescence peak energy corresponding to the lowest confined electron to heavy hole recombination energy E_{hh} , calculated using the Kronig-Penney model. However, this energy separation cannot be interpreted in terms of the LO-phonon assisted recombination which is usually accepted. The LO-phonon assisted recombination model can be ruled out by comparing the spontaneous emission and the stimulated emission for various injection current levels. The emission energy of the TE polarization was lower than that of the TM polarization. The intensity of the TE is much larger than the TM polarization. These differences can be interpreted in terms of the selection rule for the dipole recombination between confined electron to heavy hole and electron to light hole bands. (14 refs.)

75691 Helical undulator study. E.D.Shaw (Bell Telephone Labs., Murray Hill, NJ, USA), R.M.Emanuelson, G.A.Herbst.

J. Phys. Colloq. (France), vol.44, no.C-1, p.153-61 (Feb. 1983). (Bendor Free Electron Laser Conference, Bendor, France, 26 Sept.-1 Oct. 1982).

A five period helical undulator prototype of novel design has been constructed and tested. Magnetic field measurements indicate this design to be satisfactory for the construction of a fifty period undulator for a free electron laser designed to provide an output tunable from 100 μ m to 400 μ m. (16 refs.)

75692 Passively mode-locked Nd:YAG and ruby lasers with high brightness per unit active volume. O.P.Varnavsky, A.N.Kirkin, A.M.Leontovich, R.G.Mirzoyan, A.M.Mozharovsky, I.I.Solomatina (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Opt. Commun. (Netherlands), vol.45, no.5, p.342-5 (1 May 1983).

Passively mode-locked Nd:YAG (at room temperature) and ruby (at $\approx 100\text{K}$) lasers with unstable confocal resonators are described. They generated ultra-short pulses with a single pulse energy up to 50 mJ (Nd:YAG) and 50-100 mJ (ruby) and duration ≈ 40 ps. The active volume was only 5-10 cm³. A beam divergence $\approx 3 \times 10^{-4}$ rad close to the diffraction limit and high brightness of radiation $\approx 10^{17} \text{ W cm}^{-2} \text{ srad}^{-1}$ were obtained. (4 refs.)

42.60D Laser resonators and cavities

75693 Sensitivity of the intracavity method of determination of small optical losses in a continuously operating gas laser. A.S.Burmistrov, A.I.Popov.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.877-81 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.205-9 (Aug. 1982). [received: April 1983]

In order to measure small optical losses, in particular, in order to determine faint absorption lines of gases and the concentrations of the latter, intracavity resonator procedures (IRP) are used in which the sample being investigated is placed inside the laser resonator. Significantly, the peculiarities of IRP with continuously operating lasers having a narrow laser transition line—such that one can neglect within its limits the spectral dependence of the optical density of the sample under investigation—have been studied to a lesser extent. Since this form of IRP is also of practical interest, it was the subject of the authors' investigation. Specifically, the authors have investigated the case in which a gas laser with a qualitatively homogeneous type of broadening of the generating transition is used for the IRP. A typical example is a helium-neon laser with $\lambda=3.39 \mu\text{m}$ used for the analysis of microconcentrations of hydrocarbons. (7 refs.)

75694 Some properties of phase-matched resonators. Ya.Z.Virnik, V.B.Gerasimov, M.V.Zakharov, V.K.Orlov, A.Ya.Sagalovich.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1424-5 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2310-12 (Nov. 1982). [received: May 1983]

Both rotating mirrors and pass resonators are widely used today as phase-matching devices in laser setups. Resonators with rotating mirrors are always stable, and in most cases the fields oscillations are similar to the fields produced in confocal resonators. The authors show that the properties of pass-type phase-matched resonators are much more diverse. (5 refs.)

75695 Derivation of the coupling coefficients for the eigenfunctions of a spherical, optical resonator in the case of mismatching and misalignment of the incident wave. F.Bayer-Helms.

Report PTB-Me-43, Phys.-Tech. Bundesanstalt, Braunschweig, Germany (Feb. 1983), 61 pp. In German.

A Gaussian beam is characterized by a structural parameter, e.g. the waist radius, and the coordinate of its waist. The transverse modes derived from a Gaussian beam may form complete functional systems such as the S_z system with the Hermitean polynomials $H_m(x) H_n(y)$ which refers to Cartesian coordinates, and the S_r system with the generalized Laguerre polynomials $L_p^{(0)}(r^2)$ which refers to cylinder coordinates. Each transverse mode of a Gaussian beam considered as an incident wave, e.g. m,n from the S_z system, can be represented with the aid of the functions of a complete system of another Gaussian beam, \bar{S}_z or \bar{S}_r , which at the same time, furnishes the eigenfunctions of a spherical, optical resonator. In compliance with this conception, the series coefficients become coupling coefficients which are given by coupling integrals. These integrals formed by one each function from the S_z and \bar{S}_z systems, are evaluated for the general case of their geometric arrangement in relation to each other, i.e. for mismatching-the structural parameters and/or the position of the waists differ-as well for misalignment—the axes of both systems do not coincide. 75696 Passive mode locking of buried heterostructure lasers with nonuniform current injection. C.Harder, J.S.Smith, K.Y.Lau, A.Yariv (California Inst. of Technol., Pasadena, CA, USA).

Appl. Phys. Lett. (USA), vol.42, no.9, p.772-4 (1 May 1983). In this letter the authors report on a novel method to passively mode lock a semiconductor laser. They present experimental results of GaAlAs buried heterostructure semiconductor lasers with a split contact coupled to an external cavity. The split contact structure is used to introduce a controllable amount of saturable absorption which is necessary to initiate passive mode locking. Unlike previous passive mode locking techniques, the method presented does not rely on absorption introduced by damaging the crystal and is consequently inherently more reliable. They have obtained pulses with a full width at half-maximum of 35 ps at repetition frequencies between 500 MHz and 1.5 GHz. (25 refs.)

75697 Theory of mode locking at coherent Brillouin interaction. V.N.Lugovoi (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.764-9 (April 1983). Locking different components of stimulated Brillouin radiation is considered in an optical resonator for a partial filling of the resonator with a Brillouin-active medium exhibiting a coherent (parametric) interaction between the components. The dependence of the type of stable locking on the form of the longitudinal filling of the resonator with the Brillouin-active medium is shown and investigated. In particular, the possibility of the formation of single (over the period $T = 2\pi/\omega_B$, where ω_B is the Brillouin shift) light pulses is shown, provided the length of the medium ranges in intervals spaced by a characteristic 'Brillouin' length $L_B = \pi c/\omega_B n$ (where n is the medium refractive index). A new mechanism of mode locking in lasers is proposed and considered, owing to the coherent interaction between modes in the Brillouin-active medium (which partly fills the laser resonator), the effect being achieved, in particular, for the intensities of the modes generated less than the threshold of stimulated Brillouin radiation in the resonator. The conditions are elucidated of the formation of single (over the period T) light pulses. (30 refs.)

75698 The dynamics of a mode locked and frequency-doubled laser. R.M.Vasu (Central Instruments & Services Lab., Indian Inst. of Sci., Bangalore, India), K.P.J.Reddy.

Pramana (India), vol.20, no.1, p.55-64 (Jan. 1983). [received: May 1983] The theory for the transient build-up of mode locked pulses in a mode-locked and frequency-doubled laser is presented. The time required for the mode-locked pulsewidth to reach a steady-state value is computed. It is found that steady state is reached faster in the presence of internal frequency doubling because of the broadening effect of the doubling crystal. The effects of different conversion efficiencies and modulation depths on the mode-locked pulsewidth are investigated and the results are graphically presented. (14 refs.)

75699 Q-switching of the YAG laser by coloured KCl crystals. V.A.Antonov, V.M.Bezruchko, V.L.Strizhevskii, I.N.Khalimonova, A.B.Sharafutdinov, Yu.N.Yashkir.

Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.609-10 (April 1983). In Russian. Investigates the Q-switching of a YAG laser by KCl crystals with colour centres. The best Q-switching energy characteristics are achieved by choosing the output mirror with an optimal reflection coefficient during initial transmission of the coloured KCl crystal equal to 0.40 ± 0.05 . 75700 Synchronisation of laser modes by amplitude modulation: linear analysis in the spectral domain. M.Piche (Inst. Nat. de la Recherche Sci., Varennes, Quebec, Canada).

Can. J. Phys. (Canada), vol.61, no.5, p.725-35 (May 1983). In French. A theoretical study of homogeneous gain laser mode-locking by means of loss modulation is presented. A linear and causal mathematical formulation is used to describe the interaction between the laser field and the homogeneous medium. The frequency spectrum generated by the laser field is shown to satisfy a difference equation whose order is fixed by the Fourier expansion of the modulation function. Three types of solutions have been found to this equation: a family of uncoupled solutions called supermodes, a single solution, and a continuum of solutions. Unstable laser emission associated with a detuned modulation frequency is attributed to the onset of a continuum of solutions. A frequency filter with a small bandwidth suppresses such a continuum. As a result, the laser field quickly converges towards a stable profile over a broad band of modulation frequencies. (28 refs.)

75701 Frequency stabilization of CO₂ lasers: some applications. C.Freed (Lincoln Lab., MIT, Lexington, MA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.59-68 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).

Reviews the frequency stabilization and selected application of CO₂ lasers at MIT Lincoln Laboratory. Unsurpassed spectral purity and short-term stability was achieved. A long-term stabilization technique, which was used to line-center lock any regular or hot-band CO₂ isotope laser transition, is also described. (12 refs.)

75702 Error in determining laser radiation divergence by the focal spot method. Yu.A.Drozhdin, V.E.Prokopenko, V.B.Semenov.

Meas. Tech. (USA), vol.25, no.9, p.732-4 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.19-21 (Sept. 1982). [received: May 1983]

The focal spot method using a mirror wedge is dealt with and the characteristics of the photographic paper as the radiation recorder are examined. The results indicate that the method considered is sufficiently convenient for practical utilisation. Compared to the focal spot method without a mirror wedge, it assumes a commensurate measurement error and requires 10-20 times less time for processing the results. (6 refs.)

75703 Reduction of the random component in measuring pulse laser radiation intensity. V.M.Rubinshtein, A.F.Kotlyuk, A.P.Romashkov.

Meas. Tech. (USA), vol.25, no.9, p.734-7 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.21-2 (Sept. 1982). [received: May 1983]

In reproducing and transmitting the dimension of the pulse laser radiation power unit, the measurements are performed for the regime of a periodic pulse train by using two stroboscopic transducers, the first of which measures the value of the maximum power, and the second the running value of the pulse power. A result of the measurements is a set (realization) of ratios of the powers mentioned which permits determination of the amplitude-time relationship of the optical pulse measured and a description of its shape. An estimate of the random component of the error in measuring pulse laser radiation power is given and a numerical method to reduce it based on an interpolation procedure is proposed. (5 refs.)

75704 System for measuring energy and peak power of low-level 1.064 μ m laser pulses. A.A.Sanders, A.L.Rasmussen.

Report NB-NT-1058, Nat. Bur. Stand., Washington, DC, USA (Oct. 1982) iii+39 pp.

Transfer standards have been developed for measuring 1.064 μ m laser pulses of duration about 10-100 ns, peak irradiance of about 10^{-8} - 10^{-4} W/cm², and fluences of about 10^{-10} - 10^{-3} J/cm². These energy and power measurement devices use PIN and APD silicon detectors, respectively, and can be used as stable transfer standards with total uncertainties (random errors computed at the 95 percent confidence level) of 10 to 15 percent. The system for calibrating these transfer standards is also described and consists of a CW Nd:YAG laser beam acousto-optically modulated to provide low-level laser pulses of known peak power and energy. A detailed evaluation of systematic and random errors is also shown. (4 refs.)

75706 Method of quasi-energy states in nonlinear optics. A.O.Melikyan, M.L.Ter-Mikaelyan (Inst. of Phys. Res., Acad. of Sci., USSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.168-72 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.1004-6 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981).

Many important results, a significant portion of which has already been included in textbooks and monographs, have been obtained in the theory of the interaction of coherent electromagnetic radiation with atoms. The authors discuss the relationship of the method of quasi-energy states (QES) with the 'first principles' of radiation theory. The QES themselves were introduced independently of quantum radiation theory and only certain of their properties were interpreted in the spirit of the latter. The authors have demonstrated that the clarification of this relationship allows on the one hand the establishment of the applicability boundary of the classical description of an electromagnetic field interacting with atoms, and on the other hand a new physical interpretation of intensity effects during spontaneous emission from atoms in a powerful light field. (15 refs.)

75707 Fabrication of GaAs bistable optical devices. J.L.Jewell, H.M.Gibbs (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA), A.C.Gossard, A.Passner, W.Wiegmann. *Mater. Lett. (Netherlands)*, vol.1, no.5-6, p.148-51 (April 1983). Techniques for the construction of flat etalons containing GaAs are presented including: an arrangement of GaAs and AlGaAs layers on top of a GaAs substrate which results in successful substrate removal, a procedure for etching away the substrate, and a technique for mounting the remaining sample between dielectric mirrors. Experimental results from such devices are also presented. (10 refs.)

75708 Picosecond transient orientational and concentration gratings in germanium. A.L.Smiri, T.F.Boggess (Dept. of Phys., Center for Appl. Quantum Electronics, North Texas State Univ., Denton, TX, USA), B.S.Wherrett, G.P.Perryman, A.Miller. *IEEE J. Quantum Electron. (USA)*, vol.QE-19, no.4, p.690-700 (April 1983).

Presents and discusses the results of picosecond transient grating self-diffraction measurements in germanium that can be understood in terms of an orientational grating produced by anisotropic (in k space) state-filling. Although there have been predictions and indirect experimental evidence for isotropic state-filling in germanium, this is the first direct experimental indication of anisotropic state-filling in a semiconductor. The authors compare the self-diffracted signals from orientational gratings with those from band-filling induced concentration gratings and find several distinctions, all of which can be explained in terms of the theory developed in the preceding paper (1980). In addition, the authors have performed three-pulse transient lifetime measurements which indicate that the concentration grating decay is tens of picoseconds, while the orientational grating decay is too rapid to resolve with 8 ps pulses. (19 refs.)

75709 Nonphotochemical hole burning in a hydrogen bonding glass: dependence on deuteration. B.L.Fearey, R.P.Stout, J.M.Hayes, G.J.Small (Dept. of Chem., Iowa State Univ., Ames, IA, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.7013-15 (1 June 1983). The authors conducted a study to ascertain whether hydrogen bond modes are instrumental for nonphotochemical hole burning in polar organic glasses. Spectra were obtained in the photoexcitation (fluorescence) mode. The dependence of zero-phonon hole width on burn temperature was also studied. (21 refs.)

75710 Nonlinear interactions with intense femtosecond optical pulses. C.V.Shank (Bell Telephone Labs., Holmdel, NJ, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.69 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982). Summary form only given, as follows. Recent advances in optical pulse generation techniques have led to the production of short optical pulses in the femtosecond time domain. The author discusses the interaction of intense femtosecond optical pulses in solids and liquids. The use of nonlinear interactions to generate a compressed optical pulse as short as 30 femtoseconds is described. In addition, the generation of a white light continuum in the femtosecond domain is discussed.

75711 Highly nonlinear optical effects in liquid crystals. S.D.Durbin, S.M.Arakelian, M.M.Cheung, Y.R.Shen (Dept. of Phys., Univ. of California, Berkeley, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.161-9 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982). CW laser fields are strong enough to induce a large refractive index change in a liquid crystal. Optical-field-induced structural transition can occur. The large optical nonlinearity can lead to some unusual highly nonlinear optical phenomena. (21 refs.)

75712 Optical turbulence: chaos in optical bistability. K.Ikeda (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.183-92 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982). The transmitted light from a bistable optical cavity can exhibit a variety of bifurcation phenomena, passing from a stationary state, through successive periodic and chaotic states to a final fully developed chaotic state, as the intensity of incident laser light is increased. Recent studies on these phenomena are reviewed from a theoretical point of view. (16 refs.)

75713 Bifurcations to chaos in optical bistability. F.A.Hopf (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.193 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982). Summary form only given, as follows. Recent predictions by Ikeda show novel instabilities in optically bistable devices which can give chaotic behavior. Experiments confirming this prediction are presented. A discussion of the nature of chaos and the rationale for its study is also given.

75714 Optical bistability, regenerative pulsations, and transverse effects in room-temperature GaAs-AlGaAs superlattice etalons. H.M.Gibbs, J.L.Jewell, J.V.Moloney, K.Tai, S.S.Tarnag, D.A.Weinberger (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA), A.C.Gossard, S.L.McCall, A.Passner, W.Wiegmann. *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.195-204 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982). The quantum wells provided by a superlattice increase the binding energy of free excitons in GaAs, permitting 300K bistable operation. Thermal and excitonic refractive index effects compete, resulting in regenerative pulsations. Transverse observations and simulations provide other interesting effects. (21 refs.)

75715 Observation of periodic and chaotic instabilities in an all optical bistable system. H.Nakatsuka, S.Asaka, H.Ito, M.Matsuoka (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.205-6 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982). Summary form only given, as follows. Bifurcations to periodic and chaotic states have been observed in an all optical ring cavity. A mode-locked pulse train was used as a strong quasi-CW light source. The ring cavity consisted of a single-mode optical fiber allowing a propagation of a quasi-plane wave. The results are in good agreement with the theory of Ikeda et al. (see Phys. Rev. Lett., vol.45, p.709, 1980). (4 refs.)

75716 Optical bistability in the frustrated-total-reflection optical cavity. B.Bosacchi (Western Electric Engng. Res. Center, Princeton, NJ, USA), L.M.Narducci. *Opt. Lett. (USA)*, vol.8, no.6, p.324-6 (June 1983). The nonlinear behavior of a frustrated-total-reflection (FTR) optical cavity containing a nonlinear Kerr medium is considered. It is shown that optical bistability may occur at lower incident power than in the nonlinear interface system. Other potential advantages of the resonant FTR configuration over other geometries are also briefly discussed. (11 refs.)

75717 Observation of magnetically induced optical self-pulsing in a Fabry-Perot resonator. F.Mitschke, J.Mlynek, W.Lange (Inst. für Quantenoptik, Univ. Hannover, Hannover, Germany). *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1660-3 (23 May 1983). Magnetically induced optical self-pulsing has been observed in a Fabry-Perot resonator containing sodium vapor. Experiments are performed on optically pumped Zeeman sublevels of the Na ground state in the presence of a static transverse magnetic field B . When B exceeds a critical value B_{cr} , self-sustained spin precession occurs, and the transmitted light is found to be modulated at about the Larmor frequency. The use of this tunable current-controlled oscillator in optical FM signal transmission is demonstrated. (8 refs.)

42.65C Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation

75718 Amplification by stimulated Raman scattering in low-loss optical fibers. G.A.Koepp (Comsat Labs., Clarksburg, MD, USA). *Arch. Elektron. & Übertragungstechnik. (Germany)*, vol.37, no.5-6, p.145-52 (May-June 1983).

The feasibility of amplifying optical signals in low-loss fibers via stimulated Raman scattering in the infrared spectral region is discussed. After the theoretical and experimental work is reviewed, numerical results are given that predict gain values in excess of 50 dB and conversion efficiency up to 90 percent in a low-loss fiber for an 1-W pump laser. The concurrence of stimulated Brillouin scattering is shown to drastically reduce the fiber length that can be utilized in such an amplifier. Several methods are presented for reducing this limitation. (57 refs.)

75719 Picosecond time-resolved CARS in isotopically mixed crystals of benzene. F.Ho, W.-S.Tsay, J.Trout, S.Velsko, R.M.Hochstrasser (Dept. of Chem., Univ. of Pennsylvania, Philadelphia, PA, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.141-6 (13 May 1983). Time-resolved coherent anti-Stokes Raman experiments are reported for the benzene crystal 991 cm^{-1} mode and in mixed $\text{C}_6\text{H}_6/\text{C}_6\text{D}_6$ crystals. Addition of C_6D_6 results in an increase in the rate at which the excitation is trapped. This is explained by the recent theory of Velsko and Hochstrasser which predicts that the trapping rate should undergo a maximum at some isotopic impurity concentration, consistent with observations from time and frequency domain studies. A proper convolution procedure for CARS experiments in the time domain is presented. (21 refs.)

75720 Nonlinear optics in fibers and near-infrared frequency conversion. Chnlon Lin (Bell Labs., Holmdel, NJ, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.355, p.17-26 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982).

Nonlinear optical effects in fibers can affect the intensity and spectral characteristics of an optical signal and thus present power transmission limitations. On the other hand, one can make use of nonlinear optics in fibers for efficient frequency conversion and generation of new frequencies which are important for fiber-optics studies and measurements. In this paper the author reviews the use of single-mode fibers for near-infrared frequency conversion in the 1.1-1.7 μm spectral region by stimulated Raman scattering, tunable Raman oscillation, and stimulated, phase-matched four-photon parametric mixing, and discuss their applications. (34 refs.)

75721 Frequency-angular diffusion of intense quiresonant radiation. A.I.Plekhanov, S.G.Rautian, V.P.Safonov, B.M.Chernobrod (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR). *JETP Lett. (USA)*, vol.36, no.7, p.284-7 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.232-4 (5 Oct. 1982). [received: May 1983]

It is established experimentally, using the probing field method, that frequency-angular diffusion of intense quasi-resonant radiation is due to four-photon resonant parametric scattering of light under conditions of large amplification in a narrow channel of one of the scattering components. (5 refs.)

75722 Non-linear optical mixing of frequencies of a strong bichromatic field interacting with a two-level atom at high proton densities. C.Mavroyannis (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada). *Mol. Phys. (GB)*, vol.49, no.1, p.171-91 (May 1983).

The author studied the excitation spectrum arising from the interaction of a two-level atom with two strong electromagnetic fields whose initially populated modes ω_a and ω_b are near resonance with the atomic transition frequency. In the limit of high photon densities the Green's function of the system describing the electronic transition in question has been derived in a closed form and includes processes arising from the interaction of seven photon modes of both laser fields. The spectral function of the system is calculated when the frequency ω_a of the one laser field is in resonance with the atomic transition frequency while the frequency ω_b of the other field is varied. The probability amplitudes describing the relative intensities of the peaks in question are expressed as functions of the parameters $\eta_a = \Omega_a/\Delta$ and $\eta_b = \Omega_b/\Delta$, where Ω_a and Ω_b are the Rabi frequencies of the two laser fields, respectively.

It is found that when $\eta_a \geq 1$ and $\eta_b \geq 1$ the expression for the relative intensities of the bands in question are remarkably enhanced and take extremely large positive or negative values. Results of numerical calculations for a wide range of values of η_a and η_b when $\eta_a = \eta_b \geq 1$ are presented graphically and the complete excitation spectrum is discussed in detail. (22 refs.)

75723 Optical chaos in second-harmonic generation. C.M.Savage, D.F.Walls (Phys. Dept., Univ. of Waikato, Hamilton, New Zealand). *Opt. Acta (GB)*, vol.30, no.5, p.557-61 (May 1983). Instabilities leading to self-pulsing, period doubling and chaos are predicted to occur in two simple systems in nonlinear optics. Namely, second-harmonic generation, inside a coherently driven optical cavity, and subharmonic generation internal to the laser cavity. (19 refs.)

75724 Continuous-wave, single frequency, second harmonic generation in sodium vapour. M.H.Dunn (Dept. of Phys., Univ. of St. Andrews, Fife, Scotland).

Opt. Commun. (Netherlands), vol.45, no.5, p.346-50 (1 May 1983). Single frequency, second harmonic radiation has been generated continuously in sodium vapour using resonant enhancement provided by the two photon transition 3S-4D at 578.7 nm, and a transverse magnetic field to remove the isotropy of the vapour. Phase matching and linewidth effects have been studied. The generation profile of the vapour is shown to be Doppler limited. (24 refs.)

75725 Stimulated Raman oscillation in capillary waveguide resonators. A.J.Berry, D.C.Hanna (Dept. of Phys., Univ. of Southampton, Southampton, England).

Opt. Commun. (Netherlands), vol.45, no.5, p.357-60 (1 May 1983). The threshold for stimulated Raman scattering in H_2 gas using a 1.06 μ m pump has been reduced by a factor of 30 (to ~ 40 kW in a 35 ns pulse) by the combined use of a capillary waveguide and a resonator providing Stokes feedback. Similar enhancement has been observed in CH_4 where, in addition, the use of a dispersive resonator has allowed suppression of stimulated Brillouin scattering even with single mode pumping. (15 refs.)

75726 Coherent anti-Stokes Raman scattering in thin-film dielectric waveguides. G.I.Stegeman, R.Fortenberry, C.Karagulleff, R.Moshrefzadeh (Arizona Res. Labs., Univ. of Arizona, Tucson, AZ, USA), W.M.Hetherington, III, N.E.Van Wyck, J.E.Sipe.

Opt. Lett. (USA), vol.8, no.6, p.295-7 (June 1983). The authors analyze coherent anti-Stokes Raman scattering in thin-film dielectric waveguides. Extraordinary large signal levels are predicted, and two applications of this phenomenon are discussed. (12 refs.)

75727 High-efficiency laser-pulse compression by stimulated Brillouin scattering. M.J.Damzen, M.H.R.Hutchinson (Blackett Lab., Imperial Coll., London, England).

Opt. Lett. (USA), vol.8, no.6, p.313-15 (June 1983). Highly efficient compression of laser pulses down to 1 nsec in duration by stimulated Brillouin scattering has been demonstrated. Compression ratios of ~ 10 and energy-conversion efficiencies $> 70\%$ have been produced. Several compressor systems have been investigated, including the use of tapered waveguides, long-focal-length geometries, and generator-amplifier systems. (11 refs.)

75728 Parametric generation of submillimeter radiation in semiconductors in the field of a bichromatic pulse. S.K.Avetissian, E.M.Kazarian, A.O.Melikian, H.R.Minasian (Polytech. Inst., Erevan, USSR).

Phys. Status Solidi b (Germany), vol.116, no.2, p.455-63 (1 April 1983). The self-consistent problem of the interaction of three collinear laser pulses with frequencies ω_1 , ω_2 , ω_3 , propagating in a semiconductor, is discussed. The quasi-energy spectrum of the semiconductor is determined for the excitation frequencies ω_1 , $\omega_2 \leq E_g/\hbar$, where E_g is the forbidden band width, and $\omega_3 = \omega_2 - \omega_1 \leq E_g/\hbar$. The problem of resonance parametric generation of the difference frequency ω_3 is considered on the basis of an exact expression for the semiconductor polarization. The possibility of submillimeter radiation generation in semiconductors with $E_g \approx 0.1$ eV is shown. The efficiency of a conversion of the corresponding process is determined. (15 refs.)

75729 Resonant upversion of light at wavelength $\lambda = 1.06 \mu$ m in rubidium vapor. V.A.Kiyashko, A.K.Popov, V.P.Timofeev, G.V.Yurov (L.V. Kirenskiy Phys. Inst., Acad. of Sci., Krasnoyarsk, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1405-6 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2286-8 (Nov. 1982). [received: May 1983]

One promising method for frequency conversion of weak IR radiation into visible and near UV light involves using resonant four-wave parametric processes of the type $\omega_4 = \omega_1 + \omega_2 + \omega_{IR}$ in gaseous media. In this method, two types of experimental setup are usually used—some atomic transition ω_{IR} in the nonlinear medium which is forbidden in the electric dipole approximation is chosen so that it is in resonance with pumping light at frequencies ω_1 and ω_2 from an intense two-photon source, or else the frequency ω_{IR} of the transition is taken equal to the sum $\omega_{IR} = \omega_1 + \omega_2$ of the weak IR signal frequency ω_{IR} and a single strong pumping frequency ω_1 . The authors consider a scheme of the second type. The interacting waves are assumed to be monochromatic plane waves and the pumping fields E_1 and E_2 are assumed given over the length of the nonlinear medium. (6 refs.)

75730 Maximum time compression of light pulses in stimulated Brillouin scattering. V.A.Gorbanov (All-Union Sci.-Res. Inst. for Electric Welding Equipment Design & Technol., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1418-19 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2302-5 (Nov. 1982). [received: May 1983]

Studies stimulated Brillouin scattering in a focused pumping beam from a theoretical viewpoint. The author shows that if the focusing geometry is optimal and the threshold is suitably exceeded, twenty- to thirtyfold compression is possible with an energy reflection coefficient nearly equal to unity; moreover, the duration of the reflected pulse can be made shorter than the hyper-sonic relaxation time by a factor of ten. The author studies the energy and time parameters of a Stokes pulse in stimulated Brillouin scattering using the plane wave approximation with allowance for axial amplitude nonuniformity caused by focusing. (6 refs.)

75731 Picosecond molecular dynamics in liquids via degenerate four-wave mixing. G.A.Kenney-Wallace, S.C.Wallace (Univ. of Toronto, Toronto, Ontario, Canada).

IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.719-23 (April 1983). Reports measurements of degenerate four-wave mixing in liquids to study the picosecond orientational dynamics of molecules and the transition of a probe molecule from many-particle to single-particle rotational behavior as a function of dilution. Data for C_2 in pure and dilute alkane systems are presented, in which the molecular motion is characterized as diffusion, rather than impulsive, at times ≥ 0.9 ps, the limiting single-particle orientational correlation time in n-pentane at 300K. (27 refs.)

75732 Efficient phase conjugation under parametric-feedback conditions. V.I.Odintsov, L.F.Rogacheva (M.V. Lomonosov Moscow State Univ., Moscow, USSR).

JETP Lett. (USA), vol.36, no.8, p.344-7 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.8, p.281-4 (20 Oct. 1982). [received: June 1983]

A new method is proposed for exciting stimulated Brillouin scattering under generation conditions in a system with parametric feedback. Phase conjugation of the pump beam can be achieved at a considerably lower threshold intensity by this new method. (2 refs.)

75733 Degenerate four wave mixing in photorefractive BSO crystals and applications. J.P.Huignard (Lab. Central de Recherches, Thomson-CSF, Orsay, France).

J. Phys. Colloq. (France), vol.44, no.C-2, p.3-4 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

Over the past few years a new field of interest has emerged in coherent optics: nonlinear optical phase conjugation. The field includes the possibility of operating in real time on the phase and amplitude of optical wavefronts. The use of such nonlinear interactions has resulted in numerous new applications such as adaptive optics, image transmission and amplification and nonlinear spectroscopy. The author reviews the basic properties of phase conjugate mirrors and the applications of wave mixing experiments in photorefractive crystals to: optical processing, dynamic holography, interferometry, and phase conjugation. (no refs.)

75734 Laser beam critical behaviour and phase conjugation in the semiconductors, resonant media and electrooptic crystals. N.Kukhtarev, A.Borshch, M.Brodin, V.Volkov, T.Semenets (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

J. Phys. Colloq. (France), vol.44, no.C-2, p.5-14 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

A brief review of the authors' studies of optical hysteresis and holographic phase conjugation in semiconductors, resonant media and electrooptic crystals is given together with some new results. (16 refs.)

75735 Some thoughts and observations of phase conjugation in the ultraviolet. B.J.Feldman, I.Bigio, R.A.Fisher, M.Slatkine (Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Phys. Colloq. (France), vol.44, no.C-2, p.17 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

Summary form only given, as follows. Reports on ultraviolet phase conjugation studies using KrF, XeF, and quadrupled Nd:YAG lasers. Processes studied include stimulated Brillouin scattering, stimulated Raman scattering, and degenerate four-wave mixing. In some cases phase conjugate efficiencies of greater than 80% are observed. Implications and applications of these phenomena are discussed.

75736 Phase conjugation of KrF laser radiation. M.C.Gower, R.G.Caro (Laser Div., SERC Rutherford Appleton Lab., Chilton, Didcot, England).

J. Phys. Colloq. (France), vol.44, no.C-2, p.19-25 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

Reports observations of phase conjugate reflection of KrF laser radiation using both degenerate four-wave mixing (DFWM) and stimulated Brillouin scattering (SBS). Using DFWM the authors have measured reflectivities of $\sim 300\%$ and the results are in good agreement with a theory for a thermally induced mechanism in the medium. The SBS phase conjugate mirror has been used in a variety of applications which are of interest to the development of high energy rare-gas halide lasers. (10 refs.)

75737 Degenerate frequency mixing in saturable amplifiers. J.Reintjes, B.L.Wexler, N.Dieu, J.L.Walsh (Laser Phys. Branch, US Naval Res. Lab., Washington, DC, USA).

J. Phys. Colloq. (France), vol.44, no.C-2, p.27-37 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

Phase conjugation by degenerate frequency mixing has been studied in saturable amplifiers for various interaction geometries and polarization combinations. Theoretical results are compared with measurements in a XeCl amplifier. Experimental reflectivities as high as 100 are observed. (19 refs.)

75738 Relation between degenerate four-wave mixing and coherent anti-Stokes Raman scattering. S.Chandra (Sci. Applications Inc., McLean, VA, USA).

J. Phys. Colloq. (France), vol.44, no.C-2, p.39-40 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

Attempts to establish a connection between DFWM and CARS using Lorentz transformations. It is shown that a Lorentz transformed DFWM (at least in optically rare media) appears indistinguishable from CARS. Conversely, no matter how complex a CARS geometry, a simple Lorentz transformation will render it looking like a DFWM. (1 ref.)

- 75739 Phase conjugate oscillators.** A.Siegman (Edward L. Ginzton Lab., Stanford Univ., Stanford, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.43 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
Summary form only given as follows. Considers the various aspects of oscillating devices using optical phase conjugation: resonant modes in phase conjugate devices, 'self-pumped' phase conjugation effects in conventional lasers.
- 75740 Optical phase conjugation in laser resonators.** C.R.Giuliano, R.C.Lind, T.R.O'Meara, G.C.Valley (Hughes Res. Labs., Malibu, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.45-58 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
The use of phase conjugating 'mirrors' in oscillating optical structures has been a subject of recent interest, both experimentally and theoretically. One of the attractive features of a phase conjugate resonator, PCR, is its ability to provide an output wave whose wavefront depends only on the quality of the output coupler and is essentially independent of intracavity aberrations. Several concepts for PCRs are presented in which either degenerate four-wave mixing or stimulated Brillouin scattering is employed as the phase conjugate mirror; advantages and drawbacks of each are discussed. (22 refs.)
- 75741 New study and application of phase conjugation with photorefractive crystals.** B.Fischer (California Inst. of Technol., Pasadena, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.59 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
Summary form only given, as follows. A theoretical and experimental study of four-wave mixing in photorefractive crystals like SBN and BaTiO₃ is presented. A detailed theoretical analysis of the beam coupling as well as new experiments and applications are described through a distortion; among them, one-way optical field imaging, a passive (no external pumps) phase conjugate mirror which is pumped by the signal and its use in a laser resonator.
- 75742 Phase conjugation in liquids in the picosecond range.** G.Rivoire, J.L.Ferrier, J.Gazengel, N.Phu Xuan (Lab. d'Optique des Fluides, Univ. d'Angers, Angers, France). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.81-90 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
Phase conjugation is produced in the picosecond range, in different liquids, by degenerate four wave mixing, and by stimulated backward Rayleigh and Raman scatterings. The intensities and efficiencies are measured, and the influences of the exciting power and the nonlinear medium length are studied. The feasibility of image reconstruction, even with a change in the wavelength due to Raman scattering, is proved and analysed theoretically and experimentally. Temporal applications are proposed. (15 refs.)
- 75743 Polarization dependent properties of backward four-wave mixing.** S.Saikan (Dept. of Phys., Osaka Univ., Osaka, Japan). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.93-100 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
Theoretical analyses have been made of polarization- and angular momentum-dependences of backward four-wave mixing in atomic lines. These results were also applied to the problem of 'vectorial' phase-conjugation in atomic vapours. Experimental demonstration of the vectorial phase-conjugation was carried out in D₂ resonance line of sodium. Concerning the phase-conjugation spectroscopy in condensed matter, it has been proposed to detect X₁₂₂₁⁽³⁾ component to eliminate thermal grating effect. (11 refs.)
- 75744 Doppler-free conjugate emission in resonant gas media: lineshape, polarization properties and saturation.** D.Bloch, R.K.Raj, K.S.Peng, M.Ducloy (Lab. de Phys. des Lasers, Univ. Paris-Nord, Villetaneuse, France). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.101-11 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
Analyses some specific features of degenerate four-wave mixing in resonant gas media. One shows that the polarization of the phase conjugate emission is strongly affected by the residual Doppler effect. With saturating intensities, very peculiar emission lineshapes are observed and are shown to be typical effects of the velocity distribution. (18 refs.)
- 75745 Applications of degenerate four-wave mixing to high resolution molecular spectroscopy at 10.6 μm .** J.L.Boulnois (QUANTEL, les Ulis, France). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.113-24 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
CW phase conjugation on the ν_3 vibrational bands of SF₆ and OsO₄ is demonstrated as a means of investigation in high resolution spectroscopy through resonant degenerate four-wave mixing at 10.6 μm by using a stable low power CO₂ laser operating on the P(18), P(16), P(12) lines respectively. Peak reflectivities of 3.8 $\times 10^{-3}$ are measured in SF₆. They only reach 0.34 $\times 10^{-3}$ in OsO₄. Phase conjugate spectra with 2 MHz, namely sub-Doppler resolutions, are compared with simultaneous recordings of the saturated-absorption spectra over a 80 MHz bandwidth. The saturation splitting encountered on a one-photon transition in SF₆ is also analysed in terms of pressure broadening and pump imbalance. (35 refs.)
- 75746 Resonant intracavity phase conjugation in two and three-level systems.** G.P.Agrawal (Dept. of Phys., City Univ. of New York, New York, NY, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.125-31 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
A general theory of intracavity phase conjugation, applicable to any resonance situation, is developed. It is applied to discuss the cases of two-level and A-type three-level systems. The phase-conjugate reflectivity exhibits bistability and hysteresis in both cases. (22 refs.)
- 75747 Coherent light amplification and optical phase conjugation with photorefractive materials.** P.Gunter (Lab. of Solid State Phys., Swiss Federal Inst. of Technol., Zurich, Switzerland). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.141-7 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).
The electric field and fringe spacing dependence of the stationary energy transfer between two writing beams in volume phase-hologram formation with photoconductive electro-optic materials (KNbO₃:Fe²⁺, Bi₁₂(Si, Ge)O₂₀,...) has been studied. Experimental results are compared with the theoretical expressions describing the influence of the different photoinduced space-charge fields in photorefractive media. A peak exponential gain of $\Gamma = 15 \text{ cm}^{-1}$ has been reached in KNbO₃:Fe²⁺ for the proper choice of experimental parameters (such as recording wavelength, fringe spacing, applied electric field, etc.).

Results of the electric field dependence of the wavefront reflectivity p in degenerate four-wave mixing experiments are reported and discussed in terms of a similar theoretical treatment as the two-wave mixing experiments. It is shown, that peak reflectivities of $\rho = 25$ percent have been reached for KNbO₃:Fe²⁺, that conjugate complex wavefronts can be generated and that distorted optical wave fronts can be effectively corrected by four-wave mixing experiments in KNbO₃:Fe²⁺. (12 refs.)

75748 Degenerate four-wave mixing in semiconductors and ferroelectrics. M.B.Klein, R.K.Jain, G.C.Valley (Hughes Res. Labs., Malibu, CA, USA). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.149-58 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

Semiconductors and ferroelectrics are promising candidate materials for a variety of applications of degenerate four-wave mixing. The authors review nonlinear mechanisms in each material and compare the performance of both types of materials for degenerate four-wave mixing applications. (27 refs.)

75749 Misalignment sensitivity of optical resonators with phase-conjugate mirrors. Wang Shaomin (Dept. of Phys., Hangzhou Univ., Hangzhou, China).

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.2, p.173-7 (Feb. 1983).

Although the phase-conjugate resonator (PCR) has a series of good characteristics, e.g. it is unconditionally stable, and it can compensate intracavity distortions; yet the misalignment phenomenon has already been observed experimentally. In the present paper, an augmented 4X4 ray transfer matrix formalism is used to describe the operation of the PCR, and a misalignment sensitivity is worked out theoretically. (6 refs.)

75750 Diffraction gyration and reversal of the laser beam wave front in electrooptic crystals. N.V.Kukhtarev.

Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.612-14 (April 1983). In Russian.

Theoretically investigates a new effect—the diffraction gyration of light waves and describes the process of polarisation wavefront reversal during the recording of dynamic holograms in electrooptic crystals. (7 refs.) V.G.P.

75751 Direct free-hole absorption induced in germanium by 1.06 μm picosecond pulses. R.B.James (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.701-10 (April 1983).

The intervalence-band absorption coefficient in germanium is calculated as a function of the hole density and temperature for light with a wavelength of 1.06 μm . At this wavelength, the direct free-hole transitions in germanium occur between the heavy- and split-off hole bands, and between the light- and split-off hole bands. This absorption mechanism is normally negligible compared to the interband absorption; however, for a sufficiently dense electron-hole plasma, the free hole intervalence-band absorption can become comparable to the interband absorption. Furthermore, the interaction of the intense 1.06 μm light alters the distribution of resonantly coupled hole states, and leads to an intensity dependence in the intervalence-band absorption cross section. For a fixed hole density, the intervalence-band cross sections due to free-hole transitions between the heavy- and split-off hole bands and between the light- and split-off hole bands are found to decrease with increasing intensity in a manner closely approximated by an inhomogeneously broadened two-level model. Values for the saturation intensity of each resonant transition are calculated as a function of the hole density and temperature. The intensities required to begin to saturate the direct free-hole transitions are easily attainable using picosecond pulses. (42 refs.)

75752 Amplitude and phase nonlinear response of bleachable dyes using picosecond excitation. M.A.Vasil'eva (Lebedev Phys. Inst., Moscow, USSR), J.Vishchak, V.Gulbinas, V.I.Malyshov, A.V.Masalov, V.Kabelka, V.Syrus.

IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.724-30 (April 1983).

Amplitude and phase responses of bleachable dyes are experimentally investigated using a picosecond pump and probe pulse technique combined with light polarization measurements. In the measurements, the amplitude response appears in the form of induced birefringence. The method of measurement is adapted for dyes with fast relaxation of the excited state; these dyes are used for mode locking in ultrashort pulse lasers. Experimental results of phase response contribution and mutual relaxation time of amplitude and phase responses are presented for some polymethine dyes. (18 refs.)

75753 Picosecond interband saturation and intraband relaxation in germanium. A.L.Smiri, B.S.Wherrett, T.F.Boggess (Dept. of Phys., North Texas State Univ., Denton, TX, USA).

J. Phys. Colloq. (France), vol.44, no.C-2, p.71-80 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargèse, Corsica, France, 20-24 Sept. 1982).

Picosecond techniques have been used to identify and investigate two sources for the saturation of interband transitions in germanium: the usual band-filling and a previously unobserved contribution from anisotropic state-filling. (15 refs.)

75754 Nonlinear real index of refraction variations of a gas medium due to a monochromatic radiation near resonance. J.I.Cotrim Vasconcellos (Inst. de Física 'Gleb Wataghin', Univ. Estadual de Campinas, Campinas, Brazil). *Rev. Bras. Fis. (Brazil)*, vol.12, p.15-27 (March 1982). In Portuguese. [received: April 1983]

The author has calculated the nonlinear real index of refraction variations of a gas medium due to a strong monochromatic radiation causing saturation effects. The gas is supposed to be composed of two-level molecules with which the external field is nearly resonant. He assumes homogeneous (hard collisions, spontaneous decay) and inhomogeneous (Doppler effect) broadening mechanisms acting on the real index of refraction of the medium. The nonlinear dispersion of the medium is studied as a function of the detuning frequencies, saturation conditions and for various ratios between the homogeneous and inhomogeneous linewidths. In particular, the modification of the index of refraction due to saturation effects are emphasized. (15 refs.)

- 75755 Coherent phenomena involved in the time-resolved optical Kerr effect. J.-L. Oudar (CNET, Bagneux, France). *IEEE J. Quantum Electron. (USA)*, vol. QE-19, no. 4, p.713-18 (April 1983). The effect of parametric coupling between pump and probe beams in time-resolved optical Kerr effect is theoretically discussed for various experimental configurations. It is shown that with a circularly polarized pump beam, the polarization changes induced on a nearly collinear probe beam are due to this coherence effect only. In other configurations, this parametric coupling can appear as an additional contribution to the observed signal, especially when pump and probe are derived from the same laser beam. It is pointed out that this coupling can occur not only when the pump and probe beams are at the same wavelength, but also when the difference or the sum of their frequencies can excite a Raman or a two-photon resonance in the medium. (17 refs.)
- 75756 Optical power limiter with picosecond response time. M.J. Soileau, W.E. Williams, E.W. Van Stryland (Dept. of Phys., Center for Appl. Quantum Electronics, North Texas State Univ., Denton, TX, USA). *IEEE J. Quantum Electron. (USA)*, vol. QE-19, no. 4, p.731-5 (April 1983). Optical self-action in CS_2 and other liquids was used to make a power-limiting device having a picosecond response time. This device uses self-focusing in liquids to produce phase aberrations and laser-induced breakdown, which in turn limit the transmitted power. This device has near-unity transmission for input power below P_c , which is of the order of the critical power for self-focusing, and limits the transmitted power to a nearly constant value for input power greater than P_c . The onset of nonlinear transmission was adjusted by mixing various liquids to adjust the nonlinear refractive index. Experimental results using linearly and circularly polarized 40 ps (FWHM) pulses at 1.06 μm are presented. (26 refs.)
- 75757 Self-squeezing of light propagating through nonlinear optically isotropic media. R. Tanas, S. Kielich (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland). *Opt. Commun. (Netherlands)*, vol. 45, no. 5, p.351-6 (1 May 1983). In an isotropic medium in which light self-induces a cubic optical nonlinearity, the light is shown to be in squeezed states on traversal of the medium. The dependence of the squeezing effect on the polarization state of the field and the nonlinear molecular parameters is derived explicitly. A comparison is made to the photon antibunching effect in the same phenomenon. (14 refs.)
- 75758 Self-focusing of light in a laser plasma. V.L. Artsimovich, L.M. Gorbunov, V.S. Kas'yanov, V.V. Korobkin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol. 27, no. 8, p.618-19 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol. 265, no. 4-6, p.857-9 (Aug. 1982). [received: May 1983] Observations of self-focusing in the investigation of the space-time structure of the scattered radiation at the fundamental frequency ω_0 at an angle of 90° to the incident beam and to the normal to the target are reported. The experiments were carried out with the radiation of a single-frequency neodymium laser focused onto the surfaces of flat aluminum, polyethylene, and polished-glass targets at normal and oblique (20°) incidence. The spatial and time resolutions in the investigation of the scattering characteristics amounted to 5 μm and 40 psec, respectively. (9 refs.)

42.70 OPTICAL MATERIALS

- 75759 Laser plate storage. R.F. Marks, R.A. Pollak (IBM Corp., Armonk, NY, USA). *IBM Tech. Disclosure Bull. (USA)*, vol. 25, no. 11A, p.5547-8 (April 1983). Some thin films, such as Nb_2O_5 , can be selectively grown or removed in a controlled chemical environment by applying laser illumination of suitable intensity. The authors show that an optical information storage system having an erase capability is a possible application of the phenomenon. (no refs.)
- 75760 Nonisothermal relaxation during photorecording in AsSe layers. A.A. Kikineshi, V.I. Mikla, D.G. Semak, M.M. Shpiyak. *Ukr. Fiz. Zh. (USSR)*, vol. 28, no. 5, p.786-8 (May 1983). In Russian. Presents the results of an experimental investigation into the electron-hole processes and structural changes during reverse photorecording. The localised states taking part in photoinduced changes are identified by measuring the thermally stimulated conduction currents. It is found that the diffraction effectiveness of elementary holograms, recorded at $T=80\text{K}$ by the light of a He-Ne laser, increases in the interval 210 to 230K. (7 refs.) V.G.P.

- 75762 Confocal optical feedback processing system: an improved optical design. S. Johnston, S.H. Lee (Dept. of Electrical Engng. & Computer Sci., Univ. of California, San Diego, La Jolla, CA, USA). *Appl. Opt. (USA)*, vol. 22, no. 10, p.1431-8 (15 May 1983). Coherent optical feedback in the form of a simple confocal resonator has been used to solve partial differential and integral equations. However, due to aberrations, the simple feedback system has a limited space-bandwidth product. An attempt is made here to increase the space-bandwidth product and the accuracy of the optical solution by introducing optical elements with spherical surfaces and negative lens effects into the simple confocal system. (5 refs.)
- 75763 Ray tracing in a planar lens with spherically symmetric quadratic index profile. T. Sakamoto (Industrial Lab., Hyogo Prefecture, Kobe, Japan). *Appl. Opt. (USA)*, vol. 22, no. 10, p.1598-600 (15 May 1983). Some formulas of importance in lens design and evaluation have been derived on a planar lens with spherically symmetric quadratic index profile. Also a nondestructive evaluation method of the focusing constant in the index profile has been developed by the method of least squares. (9 refs.)
- 75764 Examination of plastic focusing fiber lens. S. Otake, S. Kawawa, K. Takasugi. *Anritsu Tech. Bull. (Japan)*, no. 44, p.106-12 (March 1983). In Japanese. Estimating and manufacturing of plastic focusing fiber lenses which have a nearly parabolic refractive index distribution were examined, and then performances and problems were expressed. Performances of plastic focusing fiber lenses for optical communication can be estimated by measuring of a distortion of the image, a curve of the refractive index distribution, a diameter of the focal point, and a transmission loss. The best transmission loss of test samples is -3.2 dB , so improvements will be required for use in optical communication. The method of manufacturing plastic focusing fiber lenses needs further reexamination, because of the problems awaiting solution, such as impurities, reappearance and working efficiency. (3 refs.)
- 75765 Deficient spline and the method of vignetting determination. Loh Rong, Sha Cunxian (Dept. of Computer Sci. & Technol., Peking Univ., Peking, China). *Acta Sci. Nat. Univ. Pekin. (China)*, no. 5, p.14-25 (1982). In Chinese. Suggests a cubic deficient spline method. This method is constructed on local procedures, and can combat unnatural wiggles in the interpolant. A specific lens is taken as an example. The authors determine its pupil shape by this cubic deficient spline method. (8 refs.)
- 75766 Performance evaluation of an apodized optical system with polarization masks. S.D. Gupta (Instrument Res. & Dev. Establ., Dehra Dun, India). *Opt. Acta (GB)*, vol. 30, no. 5, p.607-21 (May 1983). It sometimes becomes necessary to modify the imaging characteristics of an optical system to achieve better performance for certain applications. The modification can be achieved by various means, and the usual practice has been to modify the amplitude and phase transmissions over different zones of the pupil of the optical system; such a modification is called apodization. The author reports a method of apodization in which three polarization masks are placed at different orientations over the pupil of the optical system, which is illuminated with an elliptically polarized light beam. The performance of this apodized optical system has been investigated in terms of diffraction patterns and optical transfer functions by making use of the Jones matrix approach. It has been shown that, by suitably choosing the state of polarization of the illuminating beam and the orientation of the polarization masks, the performance of the optical system can be effectively modified. Further, with an analyser in the image plane, the diffraction pattern as well as the optical transfer function can be continuously modified for required roles. (11 refs.)

Rebrov, A.V. Savel'ev, E.V. Trushin (Inst. for Space Res., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol. 27, no. 7, p.579-80 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol. 265, no. 1-3, p.328-30 (July 1982). [received: April 1983] The most typical errors of large optical surfaces, such as astronomical mirrors, are local errors. The elimination of such errors by means of classical technology involves certain difficulties. Automated technological systems have been developed for the solution of this problem which permit the improvement of an optical surface using computer control. The authors present the results of the first factory trials of the ZEBRA-2 system in the fabrication of real optical components. (5 refs.)

75768 Optical systems of laser scanners. L.A.Markova, V.P.Mikheev, B.S.Rozov, P.I.Savostin.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.548-50 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.13-15 (Sept. 1982). The capabilities of optical light-beam scanning systems are analysed from the viewpoint of achieving the maximum resolution in devices for processing graphical information. The three most widely used scanning systems and the basic relations for analysing each of them are examined. (8 refs.)

75769 Automated calculation of two-lens and three-lens components. N.I.Kutsenko, T.I.Lushchik, M.Yu.Maulik.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.559-61 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.23-4 (Sept. 1982). A program is described for the automated calculation of two-lens and three-lens cemented components, having the same outer glasses, for given basic parameters P, W, C with the structural features of the component and higher order aberrations taken into account. (7 refs.)

75770 Basic parameters of an infinitely thin component. S.N.Bezdid'ko.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.561-2 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.24-5 (Sept. 1982). The basic parameters of infinitely thin components for a symmetrical arrangement of object and image are determined. A number of the relations in the basic parameter theory acquire a simpler form in this case, and the modified parameter W takes on a direct physical meaning. (2 refs.)

75771 Algorithm for the automated calculation of the tolerances on the structural elements of optical systems. A.P.Grammatin, N.E.Kundeleva.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.563-6 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.25-8 (Sept. 1982). An algorithm is proposed that is based on a determination of the tolerances on the structural elements of optical systems in terms of a given deviation of the wave or geometrical aberration, taking into account their technological limits and the discreteness of the values used. An example is given, involving the calculation of the tolerances on a telescope objective by using the proposed method. (7 refs.)

75772 Full field-of-view zone of optical sights for target and hunting guns. N.I.Kutnyakova.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.583-5 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.43-6 (Sept. 1982). An important performance characteristic of optical sights for target and hunting guns—the full field-of-view zone, which supplements and expands the concept of exit pupil relief—is defined. A method for measuring this characteristic has been developed. (3 refs.)

75773 Optics calculation: some new results on bent mirrors and ray-tracing. F.Cerrina (Synchrotron Radiation Center, Stoughton, WI, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.10-11. A possible solution to the high cost of grind-and-polish optical elements for the soft X-rays in some applications may reside in the use of cylindrical 'bent mirrors', where the required profile is obtained by bending a flat with a suitable edge contour. The author presents the results of further studies on this subject, where he tries to elucidate the advantages and limitations of the method. (no refs.)

75774 Lenses for microlithography; state-of-the-art and future developments. C.Babolat (CERCO, Les Ulis, France). Microcircuit Engineering 82. International Conference on Microlithography, Grenoble, France, 5-8 Oct. 1982 (Grenoble, France: Comité du Colloque International sur la Microlithographie 1982), p.65-8. In French. States that direct stepping on wafers needs better reduction lenses. The author shows the characteristics of the lenses of recent years and of up-to-date products. Future performances of near and deep UV lenses are examined. (no refs.)

75777 Realization of 90°- and 180° hybrids for optical frequencies. W.R.Leeb (Inst. für Nachrichtentechnik, Tech. Univ. Wien, Wien, Austria). *Arch. Elektron. & Übertragungstechnik. (Germany)*, vol.37, no.5-6, p.203-6 (May-June 1983).

A method to realise optical hybrids for freely propagating laser beams is presented. It is based on the phase shift that can be introduced between orthogonally polarized beam components by the use of polarizers and quarter-wave plates. For mathematical treatment of a 90°- and a 180° hybrid the Jones matrix algebra is employed. Design and successful testing of a 90° hybrid for the 10 μ m wavelength of a CO₂ laser is reported. (2 refs.)

75778 Polarization-independent beam splitter. E.E.Bergmann (Lehigh Univ., Bethlehem, PA, USA).

Rev. Sci. Instrum. (USA), vol.54, no.5, p.579-81 (May 1983). The author reports a new type of beam splitter capable of producing a division of light in a polarization-independent manner. Most off-axis beam splitter have a pronounced polarization dependence. An experimental device with a splitting ratio of about 7 dB varied less than ± 0.1 dB as a function of incident linear polarization. The device is fabricated from a thin plate of suitably oriented, uncoated, crystalline quartz. (3 refs.)

42.80B Spatial filters, zone plates

75780 Efficient approach to designing linear combination filters. B.V.K.Vijaya Kumar (Dept. of Electrical Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

Appl. Opt. (USA), vol.22, no.10, p.1445-8 (15 May 1983). Various linear combinations of simple matched spatial filters have been proposed in the literature to improve the discrimination in multiclass pattern recognition. It has been shown that all such approaches based on deterministic constraints can be modeled as similar matrix/vector problems, the only differences arising in the individual constraint vectors. Since the design of any of these linear combination filters (LCF) can be posed as a common matrix/vector problem, efficient iterative methods can be used to determine the LCFs. The application of one such method called the modified hyperplane (MHP) method for determining the LCF is described and its convergence behavior is numerically investigated for a set of seven patterns. It is shown that the MHP method yields correct LCFs (with rms error $< 0.1\%$) in less than ten iterations. (11 refs.)

75781 Optimized amplitude filtering for superresolution over a restricted field. III. Effects due to variation of the field extent. R.Boivin, A.Boivin (Dept. de Phys., Univ. Laval, Quebec, Canada).

Opt. Acta (GB), vol.30, no.5, p.681-98 (May 1983). For pt.II see *ibid.*, vol.27, p.1641 (1980). In the application of Frieden's impulse-generating filter to superresolution, the characteristics of the point response as well as those of the filter are seen to depend on the extent of the restricted field. The authors present curves that show how the filter and its diffraction pattern change with field extent, and the behaviour of some pertinent figures of merit is examined under various conditions. For a given field extent it is found that (1) the resolution gain eventually increases linearly with the order M to which the point response approximates the delta function, (2) the filter transmission ratio exhibits a maximum for a certain value of M and eventually settles to the levels characteristic of the Zernike polynomials and (3) the Strehl central-irradiance ratio and the encircled-energy ratio for the restricted field drop without limit once M exceeds the superresolution threshold. The trade-off between resolution gain, central irradiance and field extent is also investigated. (13 refs.)

42.80L Optical waveguides

(for fibre optical waveguides, see 42.80M)

75787 Dispersion and luminescence measurements of optical waveguides. A.Faik, L.Allen, C.Eicher, A.Gagola, P.D.Townsend (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England), C.W.Pitt. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2597-601 (May 1983).
 Measurements are reported for the dispersion curves in the visible wavelength range of a variety of optical waveguides. Waveguides were formed in LiNbO₃ and LiTaO₃ by the implantation of helium ions. The radiation damage reduces the refractive index in both materials by about 12% throughout the visible region. This is thought to result from amorphization of the lattice. Waveguides formed by impurity enhancement of the refractive index were measured in soda lime glass doped by ion exchange of Li, K, Rb, Cs, or Ag. In each case the percentage increase in index was wavelength dependent. In particular, the Ag ion exchange waveguides have features attributed to colloidal silver metal. The metal colloids give both dispersion anomalies and a red luminescence. The luminescence was used to measure the losses in the waveguide. (22 refs.)
75788 Nonuniqueness of the determination of the dielectric constant profile of a planar optical waveguide from the spectrum of waveguide mode refractive indices. V.N.Mogilevich. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.595-8 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.827-31 (May 1982). [received: Feb. 1983]
 An important problem in studying planar optical waveguides is establishing the profiles of their dielectric constant $\epsilon(x)$. A direct experimental determination of the distribution $\epsilon(x)$ is difficult. In this connection, methods for reproducing profiles from easily accessible measurements of the spectrum of the

refractive indices of waveguides modes, confined by the waveguide at one or several wavelengths, are being developed. In so doing, preference is given to single-wave methods, which do not require the dispersion of the material of the waveguide layer to be accounted for. However, the uniqueness of the solution of the waveguide problem does not yet indicate that a single dielectric constant profile can be associated with a given spectrum of waveguide refractive indices. Based on an analysis of exact dispersion equations, the author shows that different distributions $\epsilon(x)$ can be associated with a single spectrum of waveguide refractive indices. (5 refs.)

75789 Calculation of the light transmission coefficient of a hollow combination lightguide. I.N.Kalinchuk. *Sov. J. Opt. Technol. (USA)*, vol.49, no.9, p.540-2 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.5-8 (Sept. 1982).
 Questions dealing with the passage of light flux through a hollow combination lightguide are examined. Analytical expressions are obtained for calculating the light transmission coefficients of combination and slotted lightguides. The results of an experimental study of the light transmission coefficients of lightguides are presented. (8 refs.)

75790 Fabrication of optical waveguides in LiNbO₃ and LiTaO₃ crystals by ion irradiation. L.M.Shteingart (Phys. Inst., Acad. of Sci., Belorussian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1414-15 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2297-300 (Nov. 1982). [received: May 1983]
 The author reports test results of optical waveguides in various LiNbO₃ and LiTaO₃ crystals fabricated by ion bombardment. When LiNbO₃ and LiTaO₃ are irradiated with ions, the refractive indices for the ordinary and extraordinary waves decrease, so that only S-type waveguides can be produced in these materials. (7 refs.)

75791 The manufacture of optical fibres. P.Allias. *Toute Electron. (France)*, no.484, p.18-21 (May 1983). In French.
 The process of fabrication of optical fibres for communications purposes, as carried out by the Lyons Optical Transmission Co. under licence from Corning and improved by work done at the Marcoussis laboratories, is described, the various stages being illustrated very effectively by photographs and diagrams. The process is in two stages, preparation of the 'preform' which can then be used for the second stage, which is drawing into a filament of 20 km length, and reeling. (no refs.) J.S.

75792 Characterization of insert molded single optical-fiber connectors using ceramic balls. H.Murata (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan)*, vol.E66, no.3, p.179-85 (March 1983).
 Molded demountable single fiber connectors have been constructed, which contain precision balls within the plug moldings to locate the fiber and to align a pair of plugs. Transmission loss characteristics are examined and fiber placement precision investigated. The samples tested have exhibited less than 0.2 dB losses with index matching and less than 2 μ m fiber displacements on an average for ordinary multimode fibers. For practical application, arbitrary diameter plugs using two sorts of balls and premolding plug ferrules are also investigated. The results exhibit high precision and low losses corresponding to the design condition. The molding procedure is simple and needs no complicated alignment mechanisms. These connectors are low in cost and possible to assemble in the field. (8 refs.)

75793 Eigenmode calculation of optical waveguides: finite elements versus other methods. P.E.Lagasse (Lab. for Electromagnetism & Acoustics, State Univ. Ghent, Ghent, Belgium).
 Colloquium on 'Recent Developments in High Frequency Electromagnetic Field Analysis by Finite Element Methods', London, England, 16 May 1983 (London, England: IEE 1983), p.1/1-3
 The author briefly reviews the use of the finite element method (FEM) for the eigenmode analysis of optical waveguides. A number of eigenmode calculation methods are enumerated and compared to the FEM. (13 refs.)
75794 Analysis of optical and microwave waveguide by finite elements. B.M.Azizur Rahman (Dept. of Electronics & Electrical Engng., Univ. Coll., London, England).
 Colloquium on 'Recent Developments in High Frequency Electromagnetic Field Analysis by Finite Element Methods', London, England, 16 May 1983 (London, England: IEE 1983), p.2/1-4
 The finite element method has emerged as one of the most successful numerical methods for the analysis of high frequency microwave and optical waveguide problems. With the development of communication technology, the concept of waveguide has broadened. In most cases closed form analytic solutions for the practical waveguiding structures are not available. The optical waveguides are inherently inhomogeneous, and in many cases the dielectric material may be anisotropic. For the analysis of these types of problems vector H field finite-element method may be extremely powerful. (3 refs.)

42.80M Fibre optics

75795 Analysis of thermally induced loss in fiber-optic ribbons. G.S.Brockway (Plastics Engng. Consultants Inc., Lawrenceville, GA, USA), M.R.Santana. *Bell Syst. Tech. J. (USA)*, vol.62, no.4, pt.1, p.993-1018 (April 1983).
 Added loss during temperature cycling in a given ribboned fiber is shown to be caused by thermally induced axial compressive strain imparted to the fiber. A microbending-sensitivity parameter δ is introduced which reduces all loss-strain curves corresponding to different fibers to one characteristic master curve. Thermoviscoelasticity theory is used to calculate the time- and temperature-dependent compressive strain imparted to a ribboned fiber during a standard environmental cycle. Combining these analytical results with environmental data, the functional relationship between fiber-compressive strain and the added loss for a fiber of any given δ in an adhesive sandwich ribbon (ASR) with urethane-acrylate (UA) coated fibers has been determined. Using this analysis, the added loss for a UA ASR can now be predicted for any environmental cycle. The critical material properties that dominate the environmental performance of ASRs are the tape shrinkback at elevated temperatures and the product αEA of the coefficient α of thermal expansion, the

time- and temperature-dependent relaxation modulus E , and the area A of the coating. (9 refs.)

75796 Development of fabrication technology and measurement systems for multimode, single-mode and polarization maintaining optical fibers. J.A.Kurki (Semiconductor Lab., Tech. Res. Centre of Finland, Espoo, Finland). *Commentat. Phys.-Math. (Finland)*, no.56, p.1-110 (1983). Describes an optical fiber fabrication system consisting of a MCDV-system and a fiber drawing tower. Attenuation and bandwidth were studied in multimode and single-mode fibers in relation to material compositions and process parameters. Backscattering measurements for conical fibers are reported. A new technique for fabricating polarization maintaining fibers and preliminary measurement results are presented. (79 refs.)

75797 Computerized single mode temperature sensor. M.Essemli, J.Fontaine (Univ. Louis Pasteur, Strasbourg, France), P.Meyrueis. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.355, p.2-5 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982). A computerized single mode fiber interferometer has been designed and built. The authors describe the design of this system and discuss the results. Polarisation problems are optimised, and a very high temperature sensitivity is obtained. (9 refs.)

75798 Optical fiber interferometer sensitized to the environmental perturbation acting on the fiber probe. M.Martinelli (CISE SpA, Milano, Italy). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.355, p.6-10 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982). The passage of the reference and sensing beam through the same path in a single-mode optical fiber constitutes the basis of the new interferometer. Two main applications are suggested: Michelson-type interferometer for vibrating target measurements (FOMI) and fiber-optic link noise-free for fiber-optic sensor applications (FOIL). The experimental results point out the high noise-rejection operated by the new scheme compared with a conventional fiber-optic interferometer. (14 refs.)

75799 Modal noise in multimode optical fibers. E.G.Rawson (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA), J.W.Goodman. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.355, p.37-42 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982). A changing speckle pattern exists at the output of a multimode optical fiber if the optical source is sufficiently coherent. When spatial filtration (for example, at a misaligned connector) or polarization filtration (for example, in certain access couplers) occurs in the presence of such speckle, the optical signal power fluctuates; such fluctuations are called 'modal noise'. The authors review modal noise theory and experiment, including the prediction and measurement of the modal noise signal-to-noise ratio in the presence of spatial filtration and constrained total guided power. It also presents new results relating to modal noise effects in fiber branching devices such as star couplers, access couplers, and power dividers. (13 refs.)

75800 Optical fiber joint-loss measurement. Review of the causes of measurement inaccuracies and some proposals for meaningful measurements. F.M.E.Sladen (Thomas & Betts Corp., Raritan, NJ, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.355, p.57-60 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982). Splices and demountable connectors are a necessary component in optical-fiber systems as they allow for flexibility in both the installation and maintenance of optical-fiber links. Permanent joints (i.e., splices) tend to have less effect on system performance than remountable connectors; however, they are both capable of profoundly influencing system performance. Joints generally affect both the attenuation and bandwidth of an optical fiber link and thus require careful study. The four factors affecting joint loss are mechanical misalignments, fiber parameter mismatch, the physical properties of the medium separating the fiber ends and the excitation conditions existing in the fiber immediately prior to the joint. Some of the difficulties in measuring optical fiber joint loss are outlined and some examples of experimental test sets presented. The optical time domain reflectometry technique for loss estimation has many advantages for measurements in the field, although there still seems to be some doubts about obtaining quantitative results. (7 refs.)

75801 Two dimensional near-field contouring of optical fiber cores. E.M.Kim, D.L.Franzen (Electromagnetic Technol. Div., NBS, Boulder, CO, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.355, p.76-83 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982). A microcomputer controlled system is described for measuring the two dimensional nearfield radiation pattern from optical fibers. Because radiation measurements may be made in two dimensions, a novel method has been devised whereby a constant intensity contour of the core is mapped. A modified left-most-looking (LML) digital image encoding algorithm is used to map the contour of the fiber core. The iso-intensity map provides information about the tolerance field, in which all of the measured iso-intensity points lie, and core connector joints, and terminal points. The authors discuss the measurement apparatus, accuracy, precision, stability, and method of analysis of the NBS system. In addition, results are presented on measurements of core diameters, the length dependence of such measurements, wavelength dependence of the radiation patterns, power law fits to the patterns, calibration apparatus, and iso-intensity contours of telecommunications-grade fibers. (18 refs.)

75802 Fibre optics QC challenge. *Qual. Today (GB)*, p.9 (May 1983). The accurate measurement of optical fibres is essential both for quality control and to aid accurate splicing. The Fibercheck system from Vickers Instruments which has been designed to make fast, inexpensive and extremely precise measurement of optical fibres, is described. (no refs.)

75803 Novel polarisation phenomena on anisotropic multimoded fibers. A.W.Snyder, F.Ruhl (Inst. of Advanced Studies, Australian Nat. Univ., Canberra, Australia). *Electron. Lett. (GB)*, vol.19, no.11, p.401-2 (26 May 1983). The lowest-order modes of multimoded fibers composed of birefringent material can differ radically from the familiar modes of multimoded isotropic fibers. In general, the modal fields are neither uniformly polarised nor circularly symmetric as they would be on circularly symmetric isotropic fibers that are weakly guiding. Thus multimoded anisotropic fibers can exhibit dramatic polarisation effects which may have important practical applications. These effects are investigated by the authors. (5 refs.)

75804 Multiquartic approximation in single-mode optical fibres. G.Coppa, P.Di Vita (Centro StudiLab., Telecomunicazioni SpA, Torino, Italy). *Electron. Lett. (GB)*, vol.19, no.11, p.430-2 (26 May 1983). A new stratification method based on the approximation of the actual index profile of the fibre by means of a set of quartic curves is proposed. The method permits one to deduce accurately the propagation characteristics in the least calculation time, particularly on fibres with nonmonotonic index profiles. (6 refs.)

75805 Hybrid modes in circular cylindrical optical fibers. K.Morishita (Dept. of Precision Engng., Osaka Electro-Communication Univ., Osaka, Japan). *IEEE Trans. Microwave Theory & Tech. (USA)*, vol.MTT-31, no.4, p.344-50 (April 1983). The classification of hybrid modes in circular optical fibers is studied. It is shown that problems of the mode classifications, i.e. the crossover of the dispersion characteristics and the remarkable changes of the polarization states and the field configurations, are caused by the coupling of the HE-type modes. (16 refs.)

75806 Comments on 'The dynamical behavior of a single-mode optical fiber strain gage' [and reply]. P.A.A.Laura, J.L.Pombo (Inst. of Appl. Mech., Puerto Belgrano Naval Base, Argentina). *IEEE Trans. Microwave Theory & Tech. (USA)*, vol.MTT-31, no.4, p.364-6 (April 1983).

The frequency spectrum of the phase change signal and the resistive strain gage signal are in very good agreement. The authors discuss two points which need further clarification: (a) the validity of the mechanical analysis with special reference to the single-mode approximation; and (b) the effect of an axial force which may be present if the mechanical boundary conditions restrain the axial displacements of the structural element. (6 refs.)

75807 Silicon optical fiber splice. M.J.Brady, L.D.Comerford (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.11A, p.5518-19 (April 1983). Describes a splice connector for optical fibres which is formed by joining Si slabs having aligned anisotropically etched apparatus forming a sleeve which self-aligns the fibres as they are fully inserted. (no refs.)

75808 Safe optical connector. J.D.Crow (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.11A, p.5520-2 (April 1983). Fiber-optic connectors are described which are safe to view when disconnected even when powered by a semiconductor laser. (no refs.)

75809 Cast connector for fiber-optic modules. M.J.Brady, C.B.Burstell, L.D.Comerford (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.11A, p.5525-7 (April 1983). A miniature optical fiber connector is described for providing fiber-optic connection through a sidewall of an integrated circuit module. (no refs.)

75810 A sensitive technique for fibre profile characterization. B.Grossman (Centro de Pesquisa da Telebras-CPqD, São Paulo, Brazil). *Opt. Acta (GB)*, vol.30, no.5, p.623-7 (May 1983).

A technique has been developed that permits the detection of fluctuations as small as 1 part in 10^5 in the refractive index of graded index fibres. It consists of measuring the derivative of the profile rather than the profile itself. The procedure enables small defects on the profile to be emphasized in a smooth background. (4 refs.)

75811 The influence of mode-coupling on the degree of coherence in an optical fiber. M.Imai, Y.Ohtsuka (Dept. of Engng. Sci., Hokkaido Univ., Sapporo, Japan).

Opt. Commun. (Netherlands), vol.45, no.5, p.331-5 (1 May 1983). The modulus of the complex degree of coherence across the exit face of a coherently excited optical fiber is investigated by taking account of coupling effects between propagating modes. The authors also discuss the results of numerical calculations for a quasi-single mode fiber. The modulus exhibits an oscillatory behaviour along the fiber length if coupling or beating is present. The oscillatory modulus is found to be large compared with the value it would assume if the cross-terms were neglected. (10 refs.)

75812 Magnetostrictive fiber-optic sensor system for detecting DC magnetic fields. J.P.Willson, R.E.Jones (Standard Telecommunication Labs. Ltd., Harlow, England).

Opt. Lett. (USA), vol.8, no.6, p.333-5 (June 1983). A magnetostrictive fiber-optic sensor system employing a thin film of amorphous $\text{Fe}_{80}\text{B}_{20}$ alloy coated directly onto the fiber cladding is reported. A novel detection system to facilitate measurement of DC magnetic fields is described, and results presented show the advantages of amorphous alloys compared with nickel for sensing purposes. (8 refs.)

75813 Measurement of fiber birefringence by wavelength scanning: effect of dispersion. S.C.Rashleigh (Naval Res. Lab., Washington, DC, USA). *Opt. Lett. (USA)*, vol.8, no.6, p.336-8 (June 1983).

Scanning the wavelength in high-birefringence fibers inherently measures the group delay difference, and not the phase delay difference between the two polarization modes. Dispersion of the birefringence will result in a 10-20% error in fiber beat lengths interpolated from such measurements, even if only stress birefringence is present. Geometrical dispersion can introduce even larger errors in some fibers. (9 refs.)

75814 Modal-noise evaluation in multimode-fiber transmission. T.Kanada, K.Aoyama (Yokosuka Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Kanagawa, Japan).

Opt. Lett. (USA), vol.8, no.6, p.339-41 (June 1983). Modal noise that occurs at fiber connecting points has been investigated theoretically and experimentally. Visibility, an important factor that determines the modal-noise power has been obtained as a function of laser-diode (LD) coherency and fiber bandwidth. Modal-noise formulas, with such parameters as visibility, fiber-connection loss, and the number of modes that the fiber supports, are presented. Modal noise that is due to LD mode-partition noise is also discussed. The analytical results agree well with the experimental ones. (8 refs.)

75815 Amplification and reshaping of optical solitons in glass fiber. III. Amplifiers with random gain. Y.Kodama (Dept. of Maths., Ohio State Univ., Columbus, OH, USA), A.Hasegawa.

Opt. Lett. (USA), vol.8, no.6, p.332-4 (June 1983). For pt.II, see *ibid.*, vol.7, p.339 (1982). The optical solitons in a glass fiber with dissipation can be reshaped by periodic amplifications and thereby can be stably transmitted for a sufficiently large distance. The authors show that the solitons retain this basic property even when the amplifiers have gains with random variation. (2 refs.)

75816 Mathematical modelling of the geometrical shape of polyhedral fibre-optic elements. N.I. Isaev, I.A. Shirkova.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.543-4 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.8-10 (Sept. 1982). The question of mathematical modelling of the cross section of polyhedral elements is examined. The results of a harmonic analysis of the given and actual contours are given. (2 refs.)

75817 The propagation of light in optical fibers. M.D. Feit (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). In book: *International advances in nondestructive testing, Vol.9*, W.J. McGonagle [Ed.], p.1-16. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

A very complete theoretical model of light propagation in optical fibers has been developed which treats the total transmitted beam rather than individual modes of the system. The model enables the study of important aspects of light propagation in realistic fibers: spatial and angular confinement of the transmitted light, power losses due to absorbing jackets and splices, and bandwidth restrictions that result because the individual modes propagate energy with differing group velocities. In addition, a complete modal description of the light, i.e. find all the mode shapes and their corresponding wavenumbers, can be retrieved. The model enables the treatment of fibers with arbitrary refractive index profiles, with finite core and cladding regions, and with lossy components. It also serves as a check on more approximate theoretical methods. Excellent agreement with experimental results gives one confidence in the applicability of the model to real situations. (6 refs.)

75818 Intelligent turbidity monitoring using fibre optics. P. Exanté, G.D. Pitt, B.J. Scott, M.V. Verrells (Stand. Telecommunication Labs. Ltd., Harlow, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.109-13

The development of oil in water measuring equipment has been used to illustrate the pros and cons of fibre optic sensors. Following a wholly fibre optic solution, a more robust system was chosen where fibre optics were retained to transmit radiation to and from the measurement cell because of stringent hazardous space requirements. Where these were not necessary, and the cost of the instrument was a prime factor, the fibre optics were discarded. However, the development has come full circle in that several purely technical advantages of optical fibres have been identified such that entirely new on-line measurement techniques now seem to be feasible. These may succeed since new areas are being opened up which will provide new information and where there is no cost-sensitive or already entrenched technology available that will act as competition. The development of intelligent turbidity metering which provides a new approach to three-phase flow and concentration measurement has been discussed. (3 refs.)

75819 Stabilization of single and multimode fiber optical microbend sensors. G.F. Lipscomb, S.K. Yao, C.K. Asawa (TRW Technol. Res. Center, Redondo Beach, CA, USA).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.117-21

Stability and reproducibility problems in single and multimode fiber optic microbend strain sensors are found to be due to interference between the core mode and cladding modes in the bend region. The authors have observed strong oscillatory behavior in the core mode of a bent single mode fiber. The origin of such oscillations is due to coupling between the guided core-mode and the guided cladding-modes as verified experimentally. Application of this information to multimode fiber microbending devices has resulted in significant improvement in microbending loss sensitivity and response stability, which is very important for microbend fiber optical sensors, modulators/switches and power tap applications. Furthermore, the strong oscillation in a bent single-mode fiber may be utilized as an extremely high sensitivity microbend sensor or acoustic hydrophone. (6 refs.)

75820 Fibre optic colour sensors based on Fabry-Perot interferometry. E.R. Cox, B.E. Jones (Dept. of Instrumentation & Analytical Sci., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.122-6

Describes the construction of simple and rugged wavelength sensors based on the Fabry-Perot white light interferometer. A changing physical parameter such as temperature or pressure can be translated into the mirror displacements. Two completely different approaches to sensor construction are considered, the air-spaced and solid spacer sensors, which allow for a variety of applications. An important aspect of the work has been to investigate techniques for assembly which require minimal alignment of components, hence reducing production costs. (3 refs.)

75821 Dark-field microbend-modulated fibreoptic sensor system (DFMMFSS). C.M. Davis (Optical Technol. Inc., McLean, VA, USA), T.A. Litovitz, Macedo, P.B.

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.127-31

Shows that dark-field microbend-modulated (DFMM) fiber optic sensors exhibiting a large linear range can be operated in array configurations employing one source, a source optical fiber bus, one or more detection fibers and photodetectors. When operated in a time division multiplexed mode only a single detection fiber and photodetector are required. Arrays such as these may be used to obtain data from a number of sensors deployed over a large area. (5 refs.)

75822 Harmonic feed-back approach to fiber gyro scale factor stabilization. B.Y. Kim, H.C. Lefevre, R.A. Bergh, H.J. Shaw (Edward L. Ginzton Lab., Stanford Univ., Stanford, CA, USA).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.136-7

A second harmonic phase modulation technique is studied which can be used for the closed-loop operation of dynamically biased fiber gyroscopes. This has a dynamic range that is limited only by that of the phase modulator. Also, the dependence of scale factor on the source wavelength is greatly suppressed. (5 refs.)

75823 Analysis of noise and bias in the fibre optic gyroscope. E. Jones (Stand. Telecommunication Labs. Ltd., Harlow, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.138-42

The noise due to fibre end reflections has been computed, and a rigorous derivation has been given of backscatter noise. The noise equivalent rotation rates (NERRs) due to these sources have been compared with that due to source noise. The minimum architecture has been shown to be immune to fourth port reflections and finite isolation in the beam splitter or directional coupler, therefore the design of this component is not critical. The bias due to fibre birefringence has been shown to decrease indefinitely when polarizers are cascaded, in contrast with the extinction ratio of the cascade. The com-

puter model has confirmed this analytical result in the presence of an extended range of fibre optic gyroscope (FOG) effects. (9 refs.)

75824 An integrated optic fibre gyroscope: performance and limitations. M.C. Bone, J.W. Parker (Stand. Telecommunication Labs. Ltd., Harlow, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.143-6

Considers the design of the components for an integrated optics (IO) gyro, and the limitations imposed by their performance. The authors examine in detail those features which differ from a bulk or all-fibre gyro and are unique to an IO implementation, and conclude by describing the design of a practical gyro chip. (10 refs.)

75825 Test results of an integrated fiber-optics gyroscope brass board. H.J. Arditty (Lab. Central de Recherches, Thomson-CSF, Orsay, France), J.P. Bettini, Ph. Graindorge, H.C. Lefevre, M. Papuchon, Y. Bourbin, S. Vatoux, D. Berard, J.Y. Colombin.

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.147-50

Describes the design of a brass-board single axis fiber gyroscope using an optical integrated multifunction circuit and reports its test results. (29 refs.)

75826 Heterodyne optical fibre gyroscope. I.P. Giles, B. Culshaw, D.E.N. Davies (Dept. of Electronic & Electrical Engng., Univ. Coll. London, London, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.151-4

The optical fibre gyroscope is potentially a useful navigation instrument, but it is probably the case that an ideal system architecture remains to be defined. The authors assess the potential of a heterodyne gyroscope in terms of both sensitivity and stability. (9 refs.)

75827 Dispersion-induced non-reciprocal effects in phase-nulling fibre gyroscopes. A.J. Barlow, M.S. Dye, B.T. Trayner (British Aerospace plc, Bristol, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.155-8

Evaluates the magnitude of the dispersive effects and the variation with temperature, wavelength and axial fibre tension. The results are then applied to the phase-nulling gyro to show the effect of dispersion on the output-versus-rate curve. It is found that the non-linearity and scale factor changes introduced by dispersion are too small to significantly effect gyro performance over a wide operating range. However, a large zero bias which varies with temperature arises from gyro operation at high fringe orders. By inserting a second modulator driven at the centre frequency, zero-order fringe operation is possible thereby substantially reducing the zero bias drift introduced by dispersion. (10 refs.)

75828 Multimode fiber optic sensors. W.B. Spillman, Jr., D.H. McMahon (Sperry Res. Center, Sudbury, MA, USA).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.160-3

Multimode fiber optic sensor research carried out at the Sperry Research Center is discussed. Emphasis is placed upon a description of a generic technique based upon the photoelastic effect, for the creation of a whole class of multimode fiber optic sensors. A presentation of recent results is also given. (8 refs.)

75829 A fibre optic electric field sensor using the electrooptic effect of $\text{Bi}_2\text{Ge}_2\text{O}_{12}$. K. Shibata (Fuji Electric Corporate Res. & Dev. Ltd., Tokyo, Japan).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.164-8

Describes the electric field sensor using $\text{Bi}_2\text{Ge}_2\text{O}_{12}$, outlining its characteristics and giving an example of measuring a real electric field using this sensor. (7 refs.)

75830 Photoelastic pressure sensor with optical fibre links using wavelength characterization. B.E. Jones, R.C. Spooner (Dept. of Instrumentation & Analytical Sci., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).

First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.173-7

A bulk-sensitive pressure sensor based on the photoelastic effect with multimode optical fibre transmission links is described. Inaccuracies caused by adventitious changes in light intensity or system attenuation may be overcome by employing wavelength characterization so that the pressure is related to the wavelengths at which intensity peaks occur in a spectral scan of the transmitted light. Proposals are made for an improved sensor using programmable instrumentation. (15 refs.)

- 75831 Study of the gain coefficient of the electron flow in a microchannel plate.** E.P.Semenov.
Sov. J. Opt. Technol. (USA), vol.49, no.9, p.554-6 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.18-20 (Sept. 1982).
It is shown that by specifying the gain coefficient of the electron flow of a microchannel plate and the electrostatic field intensity in the channel, one can select the optimum values of the secondary electron emission coefficient of the emitter and the secondary electron emission coefficient for the first collision which make it possible to reduce the noise factor of the device. (15 refs.)
- 75832 Equipment and method for objective evaluation of characteristics of electron-optical converters.** Yu.Z.Matskovskaya, Yu.G.Edel'shtein, N.A.Savenchuk, V.E.Kolesnikov.
Sov. J. Opt. Technol. (USA), vol.49, no.9, p.572-4 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.33-5 (Sept. 1982).
Equipment for measuring the signal/noise ratio of electron-optical converters and a method of grading converters by means of a generalized characteristic, obtained on the basis of a determination of the signal/noise ratio and the modulation transfer function are described. (6 refs.)

- 75833 Fluctuation phenomena setting principal and practical limits to the performance of optical communication systems.** G.Grau (Inst. fur Hochfrequenztech. und Quantenelektronik, Univ. Karlsruhe, Karlsruhe, Germany).
Arch. Elektron. & Uebertragungstechnik. (Germany), vol.37, no.5-6, p.137-45 (May-June 1983).
Optical communication systems show fluctuation phenomena which are not familiar to the classical communications engineer. These phenomena may set limits to the performance of optical systems. The most important noise sources are discussed. (16 refs.)
- 75834 Optoelectronic broadband switches.** R.I.MacDonald, R.H.Hum, E.H.Hara (Dept. of Communications, Communications Res. Centre, Ottawa, Ontario, Canada).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.355, p.11-16 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982).
Progress in optoelectronic broadband switch matrices is reviewed. An experimental integrated 2X2 matrix based on photoconductive optical detectors is described. Isolation greater than 50 dB at frequencies up to 100 MHz is observed in this matrix, which is contained in a single TO-5 package. (9 refs.)
- 75835 Uniform evaluation of multichannel, hermaphroditic fiber optic connectors for tactical applications.** M.D.Drake, F.Gomes, M.Lesnick, G.W.Styskal (MITRE Corp., Bedford, MA, USA), V.E.Kalomiris.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.355, p.61-9 (1982). [received: May 1983] (Fiber Optics: Short-Haul and Long-Haul Measurements and Applications, San Diego, CA, USA, 24-25 Aug. 1982).
Describes an evaluation of candidate multichannel, hermaphroditic fiber optic connectors under uniform, and where possible, standard conditions. Connectors manufactured by TRW, Bell-Northern, Hughes, ITT-STL (Ptmargan) and ITT-Cannon were tested. The optical insertion loss was measured while the connectors underwent (1) normal mating, (2) repetitive mating, (3) strain relief flexing, (4) temperature cycling, (5) connector-to-cable tensile stress and, (6) connector-to-connector tensile stress. In addition, the candidate connectors were rated by attributes for (1) mating forces, (2) alignment ease, (3) cleaning, (4) handling damage, and (5) human factors. (3 refs.)
- 75836 A second generation of optical fibre component from HP.** S.Mello-Grand.
Elettron. Oggi (Italy), no.3, p.223-4 (March 1983). In Italian.
Second-generation components described include a short distance transmitter (HFBR 1501) and receiver (HFBR 2500) using integrated circuits in small plastic packages and plastic material optical fibres. A 'snap-in' connectors (SMA) range allows easy interfacing. The new range of transmitters (1502) and receivers (2502), allows transmission speeds of 1 m bit/sec at a distance of 22 metres to be attained. New connectors extend transmission speed to 5M bits/sec at 500 metres. (no refs.) T.H.

42.85 OPTICAL TESTING AND WORKSHOP TECHNIQUES

- 75837 Checking manufacturing accuracy for the axial system in an optical planometer.** A.I.Sergeeva.
Meas. Tech. (USA), vol.25, no.9, p.723-4 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.15-16 (Sept. 1982). [received: May 1983]
Several types of planometer are in production whose working principle involves defining an initial plane by means of three base points lying at three widely separated points on the surface and measuring the distances of points on the test surface to this surface. The accuracy of manufacture for the axial system is checked by optical means, but the tolerances in the manufacture mean that the axis of rotation is not unambiguously oriented with respect to the base element. A test method is described which enables one to determine the error caused by lack of parallelism between the sighting line and the base element. The method also enables one to adjust the orientation of the axis of rotation for various angular positions of the sighting tube. (6 refs.)
- 75838 Design of cylindrical ring springs.** N.A.Lobedev, A.V.Matveev.
Sov. J. Opt. Technol. (USA), vol.49, no.9, p.579-83 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.39-43 (Sept. 1982).
The types of cylindrical ring springs having an arbitrary number of slots are examined. The results, obtained from an evaluation of the spring stiffness and strength, are presented in dimensionless tabulated form, convenient for optical instrument designers. (7 refs.)
- 75839 Modernization of 2ShP-200M and ShPS-350M lathes.** N.M.Vorontsova, L.I.Mastyugin.
Sov. J. Opt. Technol. (USA), vol.49, no.9, p.589-91 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.50-2 (Sept. 1982).
The modernization of the 2ShP-200M and ShPS-350M lathes for the purpose of using them in fine diamond grinding and preliminary diamond polishing operations is described. (5 refs.)
- 75840 E-beam fabrication of devices for optical communication systems.** P.G.Flavin, C.Dix, M.E.Jones (British Telecommunications Res. Labs., Ipswich, England).
Microcircuit Engineering 82. International Conference on Microlithography, Grenoble, France, 5-8 Oct. 1982 (Grenoble, France: Comité du Colloque International sur la Microlithographie 1982), p.50-5
Electron beam lithography has been used in the fabrication of waveguides and gratings for optical communication devices. Software has been developed which extends the pattern data input format of a Cambridge Instruments EBMF and allows the easy specification of curved structures. It has been used to define waveguides with widths 2-5 µm and radii 75-500 µm, for both mask making and direct writing applications. Curved rib waveguides in GaAs/GaAlAs with an edge roughness <20 nm have been fabricated by ion beam milling, using a Ti mask defined by the lift-off technique. Gratings for distributed feedback laser structures have been defined in resist with periods down to 0.23 µm. Patterns with 0.46 µm period have been etched into the InP substrates. (15 refs.)
- 75841 Fabrication of a grid on a non-flat substrate by e-beam lithography [telescope lens fabrication].** M.E.Roulet, L.Stauffer, H.W.Luginbuhl.
Microcircuit Engineering 82. International Conference on Microlithography, Grenoble, France, 5-8 Oct. 1982 (Grenoble, France: Comité du Colloque International sur la Microlithographie 1982), p.61-4
The Hipparcos satellite will be launched in 1986 by the European Space Agency to perform an astrometrical mission. A key part of the telescope is a lens with a grid pattern on it. It is proposed to realize this structure using a vector scan pattern generator (Philips Beamwriter) in conjunction with conventional chrome mask fabrication techniques. This approach takes advantage of the accurate registration and high resolution of e-beam pattern generators and of the flexibility and the programmable beam focus and beam deflection control of vector scan systems. The authors demonstrate that the application of electron beam lithography is suitable for writing high-resolution patterns on non-flat substrates and that microlithography can be used successfully in other applications. - 75842 Transfer functions and impulse responses of rigid and elastic spheres.** C.Gazanhes, J.P.Sessarego, J.P.Herauld, J.Leandre (Lab. de Mécanique et d'Acoustique, CNRS, Marseille, France).
Acustica (Germany), vol.52, no.5, p.265-72 (April 1983). In French.
The transfer functions and the impulse responses of rigid and elastic spheres are investigated for values of the reduced parameter ka from 0.2 up to 28. These functions are calculated initially from modal theory and then verified experimentally from back-scattering measurements. For rigid spheres some examples are given of impulse responses derived by different techniques and the influence of creeping waves is discussed. For elastic spheres a smoothed impulse response is computed by taking the inverse Fourier transform of the

transfer function. The authors show that the impulse response is a combination of numerous discrete impulses due to multiple internal reflections in the sphere. (11 refs.)

75843 On the structure of the directivity for scattering by a rigid strip. W. Poppe (Max-Planck-Inst. für Stromungsforschung, Göttingen, Germany). *Acustica (Germany)*, vol.52, no.5, p.273-8 (April 1983). Recent studies on scattering problems lead to the result that for scattering of a plane wave by a rigid strip the directivity, which is a function of the angle of incidence and the angle of observation, may be expressed in terms of a function of one variable only. This feature is not obviously shown by the classical representations of the directivity. In this paper the relation between the long-known solutions and the recent results is investigated. Furthermore the asymptotic behaviour of the function of one variable characterizing the far-field for low and high frequencies is dealt with. A graphical representation of this function is shown for the case when the wavelength is of same order of magnitude as the width of the strip. (6 refs.)

75844 On one method of solving problems in the nonstationary diffraction of acoustic waves by thin unclosed shells. V.V.Dikhta. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.1, p.42-5 (1983). In Ukrainian. Presents a general solution of a nonstationary diffraction problem based on linear acoustics for unclosed shells of arbitrary geometric shape. The method worked out to solve the boundary value problems is based on a specific algebraization of boundary conditions and allows one to obtain exact expressions for the Laplace transformants of the solutions. (1 ref.)

75845 Observation of diffraction caustics for ultrasound. Rui-qi Dong, L.Adler (Dept. of Welding Engng., Ohio State Univ., Columbus, OH, USA), P.A.Doyle. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2832-4 (May 1983). The formation of caustics due to the diffraction of ultrasound is observed by scanning in the shadow region close behind an elliptical obstacle in water. Good agreement is obtained between experiment and the theoretical geometry of the caustic, which is an astroid centered in that shadow region. (9 refs.)

75846 Series of waves transmitted by fluid and hollow cylinders. An exact solution. A.Derem. *Rev. Cethedec (France)*, vol.19, no.73, p.1-27 (1982). In French. For the plane acoustic wave scattering by an infinite circular fluid cylinder, the exact solution of the problem may be rewritten in the form of a series which, after the Sommerfeld-Watson transformation has been applied, appears to be naturally associated with the reflected wave and the set of the transmitted waves. As the cylindrical fluid scatterer becomes an infinite fluid cylindrical shell, immersed in an external fluid and filled itself by a third internal fluid, the exact solution may again be developed into a series, which is still associated with the reflected wave and the totality of the transmitted waves. More precisely, one shows that, so to speak, the division of two determinants of order 4 may be carried out exactly, if working in the frame of an appropriate algebra whose variables are the reflection and transmission coefficients, and then relying on simple rules which one tries to formulate. The mechanism which is encountered, when considered from the mathematical point of view, is that of the limited continued fraction. Formally, the interactions at the two successive interfaces are separated in a clear-cut fashion. At each interface, it is supposed, that the interactions are purely local. (18 refs.)

75847 Transmission of a bounded acoustic beam in the 'far field' case. I. Transmission across a dioptr. M.Rousseau (Lab. de Mecanique Theorique, Univ. Pierre-et-Marie-Curie, Paris, France). *Rev. Cethedec (France)*, vol.19, no.73, p.53-67 (1982). In French. Theoretical aspects of bounded-beam transmission or reflection on interfaces introduce some new effects with respect to the plane-wave theory. J. and S. Tjøtta (1981) have developed an analytical model to describe in three dimensions, the refracted field through a water/sediment interface. They have also shown that, in two dimensions, and if dissipation is neglected, the deviation effects are still present. Their method is based upon a Green representation of the ultrasonic field. Using a Fourier-transform technique, the author has discarded some of their hypothesis. The two dimensional solution for the very far field is therefore more accurately described. In particular, she does not necessarily suppose the wavelength to be smaller than the beam width or the emitter-interface distance. Different incident-beam shapes are considered and a numerical study is proposed for each of them. (7 refs.)

75848 Transmission of a bounded acoustic beam in the 'far field' case. II. Transmission across a fluid film. M.Rousseau (Lab. de Mecanique Theorique, Univ. Pierre-et-Marie-Curie, Paris, France). *Rev. Cethedec (France)*, vol.19, no.73, p.69-90 (1982). In French. For pt.I see ibid., vol.68, p.53 (1982). The transmission of an ultrasonic bounded beam does not follow the classical laws of geometrical acoustics. In a first part, the author derived an approximate analytical solution to describe the very far field transmitted through a fluid/fluid interface. In this second part, she extends the method to a fluid layer immersed in a liquid. He obtains approximate expressions of the very far field transmitted through the layer. It again yields angular-beam-deviation effects, but these effects depend strongly on the modes in the layer. Several incident beam shapes are considered and a numerical study is proposed for each of them. (6 refs.)

75849 Diffraction of an acoustic wave by a plate moving near a plane. E.A.Krasil'shchikova (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.8, p.600-2 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1345-9 (Aug. 1982). [received: May 1983] In an ideal compressible medium with a stationary plane H, a plate AB moves translationally in a straight line at an angle γ , $-\pi/2 \leq \gamma \leq \pi/2$ relative to this plane; the angle of attack of the plate is zero. At time t_0 , the plate encounters an acoustic wave propagating along the plane H. The wave front is a plane inclined at an angle β , $0 < \beta \leq \pi$ relative to the plane H and moving with the velocity of sound c. The author considers plane-parallel flows of a gas in a fixed coordinate system Oxz. The origin O is situated at the point occupied by the boundary A of the plate at the time t_0 . Starting at the time when the wave reaches the boundary B of the plate, a vortex line, i.e., a line of discontinuity of the horizontal velocities, descends from the surface of the plate. (7 refs.)

(see also 43.60 Acoustic signal processing; 43.88 Transduction; devices for generation and production of sound)

75850 Multimode interference mechanism in $V(z)$ curves obtained by acoustic line focus beam. J.Kushibiki, K.Horii, N.Chubachi (Dept. of Electrical Engng., Tohoku Univ., Sendai, Japan). *Electron. Lett. (GB)*, vol.19, no.10, p.359-61 (12 May 1983). The multimode interference mechanism in the acoustic material signatures of $V(z)$ curves, which generally deforms the dip intervals and the shape, is investigated theoretically and experimentally for the acoustic line focus beam. It is shown, taking a (111)-Si substrate as an example, that $V(z)$ curves associated with multiple leaky waves are represented as a superposition of elemental $V(z)$ curves with different characteristic dip intervals corresponding to the respective velocities of the leaky waves. (9 refs.)

75851 Phase conjugation in acoustics. A.Levelut (Lab. d'Ultrasons, Univ. Pierre et Marie Curie, Paris, France). *J. Phys. Colloq. (France)*, vol.44, no.C-2, p.61-6 (March 1983). (International Workshop on Optical Phase Conjugation and Instabilities, Cargese, Corsica, France, 20-24 Sept. 1982). Coupling between the elastic strain ϵ and the electric field E of the forms $B\epsilon E$ or $\gamma\epsilon^2 E$ make phase conjugation possible in acoustics. The simple case of a single acoustic wave and its-conjugated wave is first given. Then the more complicated case of phonon echoes is presented. Some examples of applications are given. (14 refs.)

75852 Influence of relaxation on the acoustic self-induced transparency. G.T.Adamashvili (Tbilisi State Univ., Tbilisi, USSR). *Phys. Lett. A (Netherlands)*, vol.95A, no.8, p.439-42 (23 May 1983). Using a singular perturbation theory for the method of the inverse scattering transform, the influence of transverse relaxation of the acoustic self-induced transparency is considered. It is shown that account of the relaxation improves the quantitative agreement of the theory with experiment. (7 refs.)

75853 Concentration mechanism for acoustic self-effects in stratifying liquid solutions. F.V.Bunkin, G.A.Lyakhov, O.B.Shuman (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.9, p.451-2 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1048-51 (Sept. 1982). [received: May 1983]

A natural direction in the development of nonlinear acoustics is to make use of some inelastic nonlinearity mechanisms (by selecting appropriate media): 1) universal nonlinearity mechanisms, e.g. the thermal mechanisms and the acoustic-streaming mechanism; and 2) mechanisms which are specific to a particular class of liquids. Particularly interesting in the second group are mechanisms associated with acoustically induced changes in physical quantities X which are order parameters for phase transitions. (6 refs.)

75854 A closed form method for the measurement of attenuation in nonlinearly dispersive media. P.A.Narayana, J.Ophir (Dept. of Radiology, Univ. of Texas Medical School, Houston, TX, USA). *Ultrason. Imaging (USA)*, vol.5, no.1, p.17-21 (Jan. 1983). A closed form solution of the equation describing the spectrum of a Gaussian pulse propagating in a medium with nonlinear frequency dependence of attenuation is presented. This solution suggests that in general the spectrum remains Gaussian, subject only to center frequency downshift and bandwidth reduction. The possibility of experimentally determining the two nonlinear material parameters from the measurement of the center frequency downshift and the reduced bandwidth is proposed. (11 refs.)

75855 Spectral shifts of ultrasonic propagation: a study of theoretical and experimental laws. P.A.Narayana, J.Ophir (Dept. of Radiology, Univ. of Texas Medical School, Houston, TX, USA). *Ultrason. Imaging (USA)*, vol.5, no.1, p.22-9 (Jan. 1983). The theoretical relationship between center frequency downshift and the spectral bandwidth was investigated for pulses with a sinc(x) spectrum propagating through lossy media. Power law and exponential models for frequency dependence of attenuation were used. Six target materials encompassing a range of attenuation parameters were used to verify the theoretical model. The frequency downshift data from these materials was used to calculate their respective attenuation parameters. It was shown theoretically and verified experimentally that for small frequency downshifts, the sinc(x) model yields the same material parameters as the Gaussian model. The choice of the model for the attenuation of the material was found to be inconsequential. (7 refs.)

(see also 92.10 Physics of the ocean)

75856 Error rates for M-ary noncoherent FSK in impulsive reverberation noise. A.M.Maras, H.Davidson, A.G.J.Holt (Dept. of Electrical & Electronic Engng., Newcastle upon Tyne Univ., Newcastle upon Tyne, England). *Electron. Lett. (GB)*, vol.19, no.11, p.405-6 (26 May 1983).

It is shown that reverberation noise for primary acoustic scattering in the ocean has an integral representation and that a canonical model for its analysis can be found. Exact values of error rates for M-ary noncoherent FSK for correlation receivers in such noise are given. Comparison with the well known Gaussian case is also made. (8 refs.)

75857 Applications of adaptive signal processing to the reduction of flow-induced noise in small underwater vehicles. R.N.Carpenter, T.J.Curry, D.Pearson (Ocean Systems Div., Gould Inc., Middletown, RI, USA). Proceedings of ICASSP 83. IEEE International Conference on Acoustics, Speech and Signal Processing, Boston, MA, USA, 14-16 April 1983 (New York, USA: IEEE 1983), p.969-72 vol.3

The authors investigate analytically and experimentally the effectiveness of adaptive filtering for reducing flow induced sonar interference. Noise and signal fields are modeled and applied to an array whose beamformer is designed to maximize signal to noise ratio. The beamformer output is applied to an adaptive processing system with two auxiliary channels, one for a spatial sample, and one for a temporal sample of interference. Noise, signal, and

adaptive filter parameters are examined analytically to define design guidelines for the system and assess performance in a variety of realistic signal and noise situations. The hardware implementation emphasizes architectures that meet the performance requirements and are responsive to the physical constraints of small underwater vehicles. A digital high speed, pipelined transversal filter is used to produce the noise cancelling signal, and computations for error signal and filter weights are performed in parallel by high speed microprocessors. (3 refs.)

75858 A detector for acoustic directionality. P.G.Harper, S.I.Jardine, A.J.Quinn, D.M.Treherne (Dept. of Phys., Heriot-Watt Univ., Edinburgh, Scotland).

Proceedings of ICASSP 83. IEEE International Conference on Acoustics, Speech and Signal Processing, Boston, MA, USA, 14-16 April 1983 (New York, USA: IEEE 1983), p.977-80 vol.3

Describes the principles, construction and performance of a new type of acoustic directional detecting instrument intended for borehole operation and adapted to a circularly confined space. The operating principle lies in the orientational pinning of resonator vibrational modes to the pressure gradient of the sound source. In its simplest form, a pair of antinodes lines up with the source direction. The resonator consists of a metal hemispherical shell suspended at its apex and equipped with semiconductor strain gauges. The encapsulated device has been tested in water and achieves an accuracy of 2°. (5 refs.)

75859 The impact of refraction on time-delay estimation. E.R.Robinson, A.H.Qazi (Naval Underwater Systems Center, New London Lab., New London, CT, USA).

Proceedings of ICASSP 83. IEEE International Conference on Acoustics, Speech and Signal Processing, Boston, MA, USA, 14-16 April 1983 (New York, USA: IEEE 1983), p.981-4 vol.3

The objective is to investigate the sensitivity of correlograms to various sound velocity profiles, using the Generic Sonar Model to compute the cross-correlation function for an array of two separated receivers situated in realistic ocean environments. The results were compared with those predicted assuming isovelocity profiles. The influence of the target range and bearing, as well as the vertical separations of the receivers, is demonstrated for each environment considered. (2 refs.)

75860 Airborne sound insulation index of double walls: application of two simplified methods for estimating transmission loss. G.Pagliarini, R.Pompili (Istituto di Fisica Tecnica, Univ. di Bologna, Bologna, Italy).

Acustica (Germany), vol.52, no.5, p.296-9 (April 1983).

Two simplified methods have been applied to a considerable number of cases for different values of the surface masses and the distance between the two panels: the transmission loss curves so calculated have been compared with the reference curve of ISO/R 717 in order to obtain the sound insulation index I_a . The results have been correlated towards a single equation (one for each method) which provides, for a given value of $\sigma_1 = \sigma_2$ and d , the corresponding value of I_a . (11 refs.)

75861 Modular system for reducing the noise of tube-cooled HV motors. W.Amey (Standard Products Div., Siemens AG, Erlangen, Germany), M.Tikvicki.

Siemens Power Eng. (Germany), vol.5, no.2, p.77-81 (March-April 1983). Various demands are placed on electric motors with respect to noise emission. For Siemens tube-cooled HV motors, which are in themselves quiet running, sound-reducing elements have been developed as a modular system for still greater individual reduction of aerodynamic, magnetic and bearing noise. 75862 Videotape editing suite design. D.M.Winkler (Teletronics, New York, NY, USA).

SMPTE J. (USA), vol.92, no.3, p.276-83 (March 1983).

Two problems traditionally ignored in the design of videotape post-production editing suites are room acoustics and overall system integration with an editing computer. This paper offers a solution to each of these problems. A method of system design, used to create Teletronics's Editing Suite B, is presented. A physical overview of the editing suite is described, including acoustic requirements and a system control and integration scheme. (8 refs.)

75863 Computer simulation of acoustic intensity in a rectangular enclosure. D.Allen-Booth, G.J.McNulty (Sheffield City Polytech., Sheffield, England).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.287-9 vol.3

The paper is concerned with the prediction of omnidirectional sound intensity in an enclosed area. The main feature of the work is the estimation of sound intensity at a receiving point for a given number of reflections. This is highlighted by the fact that for a hard walled enclosure or one of low absorption coefficient then the effect of reflection is high. In such a case the number of reflections is computed to indicate the additional sound intensity required. Thus the acoustics of the area can be planned to suit a given requirement. (3 refs.)

75864 Computer simulation of sound in polygonal shaped enclosures. G.J.McNulty, D.Allen-Booth, R.Gunson, A.Tanchou (Sheffield City Polytech., Sheffield, England).

10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.290-2 vol.3

The predicted and experimental investigation of sound pressure levels in an irregular planform area is presented. A feature of the work is the computer mapping of the area and the consideration of images and reflection orders for a given area. (4 refs.)

IMAX and OMNIMAX theatre design See Entry 74551

43.60 ACOUSTIC SIGNAL PROCESSING

75865 A geometric approach to the filtered backpropagation algorithm.

M.L.Oristaglio (Schlumberger-Doll Res., Ridgefield, CT, USA).

Ultrason. Imaging (USA), vol.5, no.1, p.30-7 (Jan. 1983).

Shows how the filtered backpropagation algorithm for parallel-beam diffraction tomography can be implemented geometrically by weighted straight-line projections. The resulting algorithm is formally equivalent to the original approach using Fourier transforms, but reorganizes the calculations to separately backpropagate each plane-wave component of the filtered data. In principle, at least, the projection method also suggests the design of an ultrasound scanner that records the wavefield with line detectors. (6 refs.)

75866 Lateral inverse filtering of ultrasonic B-scan images. H.Schomberg, W.Vollman, G.Mahnke (Philips Forschungslab. Hamburg, Hamburg, Germany).

Ultrason. Imaging (USA), vol.5, no.1, p.38-54 (Jan. 1983).

The formation of ultrasonic B-scan images using parallel beams may be modelled as a lateral, one-dimensional convolution of the beam profile and an unknown but wanted reflection coefficient. Lateral inverse filtering, or deconvolution, might therefore be used to improve the image quality. Two different deconvolution techniques are applied to both an image of a tissue mimicking phantom and a human liver. An enhancement of the resolution (defined as the reciprocal of the half-width of the image of a point reflector) of about 1.4 is achieved. This is in good agreement with the previously derived formula $R = \sqrt{\ln \text{SNR}}$, which relates the signal-to-noise ratio, SNR, to the resolution enhancement, R. However, each method also creates artifacts, and despite the slight resolution enhancement, the deconvolved liver images do not exhibit more information nor are they more appealing. So it is felt that the computational effort is wasted. This failure is not a fault of the special deconvolution techniques tried, but rather caused by the logarithmic dependence of R on SNR and by the noise level, which is largely due to macro- and microscopic inhomogeneities of the tissue and cannot be made arbitrarily small. (14 refs.)

75867 Modal dispersion effects on coherent signal processing parameters.

K.D.Flowers (Naval Res. Lab., Washington, DC, USA).

Proceedings of ICASSP 83. IEEE International Conference on Acoustics, Speech and Signal Processing, Boston, MA, USA, 14-16 April 1983 (New York, USA: IEEE 1983), p.973-6 vol.3

Acoustic signals propagated in deep ocean ducts are geometrically (or modally) dispersed. Using a model, which for long range deep ocean propagation has been shown adequately to predict dispersion measures, the author determines that the effect of dispersion on the bandwidth of the signal is small. However, in coherently correlating spectrally separated but related signals the effect on the allowable integration time is significant. Curves relating the allowable integration time as functions of frequency and range rate between the source and receiver are presented. (5 refs.)

75868 Pitch translation of trumpet tones. F.Cahn (New England Digital Corp., White River Junction, VT, USA).

Proceedings of ICASSP 83. IEEE International Conference on Acoustics, Speech and Signal Processing, Boston, MA, USA, 14-16 April 1983 (New York, USA: IEEE 1983), p.1380-3 vol.3

In an attempt to design trumpet timbres for digital music synthesis, notes of a trumpet were digitally recorded. Spectral analysis at high resolution showed both a harmonic line spectrum and a weak continuous spectrum. The continuous spectrum did not appear to contribute to the tone. Shifting the pitch by sample rate conversion (interpolation or decimation) caused serious changes in tone unless the spectral envelope was deconvolved from the signal before pitch shifting and reconvolved with the shifted signal. This procedure can be used to simulate the spectral envelope of a trumpet, which remains roughly constant as the pitch is changed. (4 refs.)

43.70 SPEECH COMMUNICATION

(inc. speech perception, speech intelligibility, and speech synthesis; see also 87.36 Speech)

75869 Intelligibility of consonants in CVC utterances produced by dyadic rule synthesis. L.C.W.Pols (Inst. for Perception TNO, Soesterberg, Netherlands), J.P.Olive.

Speech Commun. (Netherlands), vol.2, no.1, p.3-13 (May 1983).

The intelligibility of initial and final consonants in monosyllabic CVC utterances was measured for rule-synthesized speech (dyadic concatenation). In order to evaluate the intelligibility results, two additional speech conditions were tested: PCM-coded speech (12 bits, 10 kHz sampling rate), and LPC-resynthesized speech (12 coefficients). The stimulus set consisted of all possible initial and final consonants appearing in nine different CVC contexts,

namely with three vowels and with three nonneighboring consonants. The subjects had to identify the initial or final consonant in each word and could choose any single consonant as a response. The overall percentage correct scores, averaged over 33 listeners, for the initial and final consonants, were 93% and 92.8% for PCM-coded speech, 86.7% and 85.4% for LPC-synthesis, and 58.2% and 73.5% for rule-synthesized speech. Apart from these scores also the actual confusions are discussed in some detail. More important than the scores achieved for this particular, meanwhile improved, version of the rule-synthesis system, was the insight gained in how to evaluate and improve such systems. (24 refs.)

75870 Categorical or continuous speech perception: a new test. D.W. Masaro, M.M. Cohen (Univ. of California, Santa Cruz, CA, USA). *Speech Commun. (Netherlands)*, vol.2, no.1, p.15-35 (May 1983). An important question in speech perception is whether listeners have continuous or categorical information about the acoustic signal in speech. Most traditional experimental studies have been interpreted as evidence for categorical perception. It is argued in this paper that more recent results taken as evidence against categorical perception are not unequivocally negative. Accordingly, further tests between continuous and categorical views of speech perception are necessary. In the present experiments, listeners were asked for continuous rather than discrete judgements in order to provide a more direct answer to this question. Subjects were asked to rate speech sounds according to where they fell on a particular speech continuum. The continua consisted of stop consonants varying in place (/b/ to /d/) or voicing (/b/ to /p/) or a vowel continuum varying from /i/ to /I/. The distributions of rating responses of individual subjects were used to test quantitative models of categorical and continuous perception of acoustic features in speech. The results provide strong evidence against the categorical perception of speech contrasts, and contribute additional evidence for the role of continuous acoustic feature information in speech processing. (45 refs.)

75871 A synthesis-based method for pitch extraction. K.K. Paliwal, P.V.S. Rao (Speech & Digital Systems Group, Tata Inst. of Fundamental Res., Bombay, India). *Speech Commun. (Netherlands)*, vol.2, no.1, p.37-45 (May 1983). A synthesis-based method for pitch extraction of the speech signal is proposed. The method synthesizes a number of log power spectra for different values of fundamental frequency and compares them with the log power spectrum of the input speech segment. The average magnitude (AM) difference between the two spectra is used for comparison. The value of fundamental frequency that gives the minimum AM difference between the synthesized spectrum and the input spectrum is chosen as the estimated value of fundamental frequency. The voiced/unvoiced decision is made on the basis of the value of the AM difference at the minimum. For synthesizing the log power spectrum, the speech signal is assumed to be the output of an all-pole filter. The transfer function of the all-pole filter is estimated from the input speech segment by using the autocorrelation method of linear prediction. The synthesis-based method is tried out on real speech data and the results are discussed. (18 refs.)

75872 An analysis of the diplophonia phenomenon. P.H. Dejonckere, J. Lebacqz. *Speech Commun. (Netherlands)*, vol.2, no.1, p.47-56 (May 1983). Diplophonia is the simultaneous presence in the voice of two separate tones, heard as distinctly different in pitch. While permanent diplophonia is a somewhat rare phenomenon, transient bitonality is frequently noticed in patients either with lesional or functional hoarseness. Diplophonia was observed in 72 patients, and various acoustical, visual and glottographical techniques of investigation were performed. Acoustically, diplophonia is due to the addition of a second subharmonic series to the normal F_0 harmonic structure. Mechanically, diplophonia is always associated with abnormal oscillatory movements of the vocal folds involving a double or multiple phased closing or opening movement of the glottis, or a beating phenomenon of the two folds oscillating at different frequencies. As a general rule, diplophonia is associated with excessive air escape through the glottis, which is a cause of hoarseness. Diplophonia is not a specific characteristic of a particular aetiology of dysphonia. (15 refs.)

75873 Time domain properties of the two-pole model of the glottal waveform and implications for LPC. J.R. Deller, Jr. (Dept. of Electrical Engng., Illinois Inst. of Technol., Chicago, IL, USA). *Speech Commun. (Netherlands)*, vol.2, no.1, p.57-63 (May 1983). LPC speech production models often assume a two real pole function for the glottal volume velocity waveform. This paper discusses the properties of this glottal model with respect to key time domain features and concludes that it is physiologically unrealistic for normal waveform representation. Implications for the performance of LPC analysis schemes, and the perceptual quality of vowel sounds synthesized using this model, are discussed. (27 refs.)

75874 Helium speech processor using linear prediction. S.W. Beet, C.C. Goodyear (Dept. of Electrical Engng., Univ. of Liverpool, Liverpool, England). *Electron. Lett. (GB)*, vol.19, no.11, p.408-10 (26 May 1983). Currently available helium speech processors provide a linear frequency scaling but, at the greater depths encountered in recent years, a nonlinear shift is desirable. The authors suggest a method based on linear prediction, which will produce such a shift, while retaining a reasonably low computational cost. (6 refs.)

75875 Theoretical model for the Speech Input Device SID3. I. Filters. D. Schofield, D.R. Manning. *Report NPL-DITC-20/83*, Nat. Phys. Lab., Teddington, England (April 1983), 17 pp. SID3 is a hardware preprocessor used in the NPL work on speech recognition. This is part 1 of a set of reports in which the operation of SID3 is described, giving a mathematical model of its operations as far as practicable. This model is used to answer questions on the dynamic response of SID3 and its ability to measure the frequency and level of correlation when the input is a pure tone, and to resolve pairs of pure tones. The current report studies the filters used in the three voiced correlation channels and derives their static and dynamic characteristics. (4 refs.)

43.75 MUSIC AND MUSICAL INSTRUMENTS

75876 Oboe normal mode adjustment via reed and staple proportioning. A.H. Benade (Dept. of Phys., Case Western Reserve Univ., Cleveland, OH, USA), W.B. Richards. *J. Acoust. Soc. Am. (USA)*, vol.73, no.5, p.1794-803 (May 1983). The authors have analyzed a simple theoretical model of an oboe, having a truncated conical air column of variable length and a reed assembly consisting of a tapered neck leading to a closed, cylindrical cavity. Proportions are

chosen for this assembly so that its input admittance at the bottom of the neck is very closely the same function of frequency as the admittance of the missing conical segment at the apex of the air column for frequencies below the tone-hole cutoff. The most important requirements are that the reed assembly by itself possess the same volume and lowest-mode frequency as the missing apex. The intervals between the first-mode frequency and the below-cutoff frequencies of the second, third, and fourth modes of the model instrument can be made harmonic to within five cents as the length of the air column is varied to sweep the first mode through an octave range. The authors have investigated the effects of small variations in the proportions of the reed assembly on the natural frequencies of the model instrument. The results provide practical guidance for adjustment of the reed structure of a real oboe to special features of its own not-quite-conical acoustical behavior. (18 refs.)

75877 Acoustic streaming, dimensional analysis of nonlinearities, and tone hole mutual interactions in woodwinds. D.H. Keefe (Dept. of Phys., Case Western Reserve Univ., Cleveland, OH, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.5, p.1804-20 (May 1983). The transmission line description of a woodwind assumes that the linearized wave equation of acoustics is accurate, and that the woodwind tone holes are independently represented in the transmission line by shunt and series impedances. Additional interactions exist between the tone holes when the inter-hole separation becomes small relative to the main bore diameter. Internal hole interactions, expressed via the main bore evanescent modes, are most important in woodwinds with large diameter holes such as the saxophone and Boehm flute. Tone holes interact externally to a lesser degree when the radiated sound field from one hole modifies the near field of neighboring holes. Acoustic streaming and convective nonlinearities are components of the sound field in woodwinds under playing conditions. The presence of the nonlinear sound field is correlated with changes in timbre and the stability of oscillation, and is more pronounced for tone holes whose height is much smaller than the hole diameter. Dimensional analysis, using the Reynolds number associated with the steady streaming velocity and the Strouhal number associated with the strength of the convective nonlinearity along the streamlines near the tone hole edges, is used to estimate the importance of sound field nonlinearities in various woodwinds. Observation and dimensional analysis are in agreement that nonlinearities are most important for the low register tones of a woodwind. The tone hole geometries of woodwind families are tabulated and discussed. (29 refs.)

75878 Flue organ pipes: adjustments affecting steady waveform. A.W. Nolle (Dept. of Phys., Univ. of Texas, Austin, TX, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.5, p.1821-32 (May 1983). Adjustable flue organ pipes are used in studying the phase and amplitudes of harmonics relative to the fundamental for various horizontal positions of the upper lip, and the behavior of the spectrum as the mean jet velocity is changed in the range 5 to 39 m/s. An analog-digital electrical oscillator with two resonant circuits and a switchlike feedback characteristic resembling that suggested by Fletcher for flue pipes is also studied; biasing in the feedback circuit is analogous to displacing the pipe lip relative to the jet. Phase of a pipe harmonic relative to the fundamental changes approximately 180° at the amplitude minimum of the harmonic, as the lip is displaced horizontally, and slowly elsewhere. The electrical analog gives similar results. For each pipe model there is a 'saturation' value of supply pressure (jet velocity) above which the fundamental amplitude is nearly constant. Evidence of phase locking of free-edge signals to the pipe oscillation is found. With a broad beveled lip, pipe oscillation can occur without the jet entering the pipe. (20 refs.)

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

[for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65]

75879 Quality control of round or elliptical objects by detecting multiply reflected and refocused photoacoustic signal. H. Coufal, S.T. Lam, A.C. Tam (IBM Corp., Armonk, NY, USA). *IBM Tech. Disclosure Bull. (USA)*, vol.25, no.11A, p.5446-7 (April 1983). The technique of detecting multiply reflected and self-refocused pulsed photoacoustic signals (generated and detected at the center of the disk) provides an unsurpassed quality-control method, being non-destructive, non-contact and non-contaminating, reliable and fast. (1 ref.)

75880 Acoustic testing. T.E. Lanham (IBM Corp., Armonk, NY, USA). *IBM Tech. Disclosure Bull. (USA)*, vol.25, no.11A, p.5495-6 (April 1983). Describes a technique to measure the nuisance value of noise to a human operator by using a program which operates on the constant bandwidth data stored in an analyzer to generate a modified frequency spectrum of the noise levels representing the output from an ideal analyzer with swept filter of constant percentage bandwidth. (no refs.)

75881 Automatic sound power measurement. T.E. Lanham (IBM Corp., Armonk, NY, USA). *IBM Tech. Disclosure Bull. (USA)*, vol.25, no.11A, p.5497-8 (April 1983). Describes a technique by which sound power of apparatus under test is automatically measured under computer control by means of a rotating boom carrying a number of microphones supplying sound data to a digital analyzer. (no refs.)

75882 The optimization of electronic precision in ultrasonic velocity measurements. A comparison of the time interval averaging and sing around methods. J.D. Aindow, R.C. Chivers (Phys. Dept., Univ. of Surrey, Guildford, England). *J. Acoust. Soc. Am. (USA)*, vol.73, no.5, p.1833-7 (May 1983). Measurement of ultrasonic velocity is of importance in fluids for physical chemistry and in solids for both fundamental and applied investigations. In fluids, the sing around technique is most widely advocated as a single measurement principle with calculated high precision. Time interval averaging has also been used for some time, but its potential has been greatly increased by recent developments in instrumentation. The purpose of this paper is to define a criterion, based upon confirmatory experimental evidence, for the preferential use of one technique or the other in a given experimental situation. (11 refs.)

75883 Optical probing of acoustic waves on rough surfaces. R.L. Jungerman, B.T. Khuri-Yakub, G.S. Kino (Edward L. Ginzton Lab., W.W. Hansen Lab. of Phys., Stanford Univ., Stanford, CA, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.5, p.1838-41 (May 1983). The problem of optically measuring acoustic displacements on samples with rough surface texture is examined. A focusing lens system which increases the amount of scattered light collected from a rough surface is presented. A

computer-controlled scanning system for an all-fiber-optic acoustic surface wave probe is described which electronically divides out surface reflectance changes encountered while measuring rough samples. The probe demonstrates the ability to optically measure acoustic displacements on surfaces with a roughness comparable to that produced by most common manufacturing processes. An image of the acoustic field surrounding a defect in an aluminum test sample is presented. (11 refs.)

75884 Doppler time mapping. A.R.Gondeck (Dept. of Electrical Engng., Univ. of South Florida, Tampa, FL, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1863-4 (May 1983).

The algorithm presented by D.W. Ricker ['Echo waveform synthesis in a rapidly varying geometry', *ibid.*, vol.72, p.1321-1323 (1982)] for describing time-mapping when the trajectories of both a moving target and the projector are known contained the problem that some of the vehicle motion is transparent and error is introduced. An alternative algorithm, described in this letter, avoids this problem, is computationally more efficient, with no accumulative error, and is simple to program. (2 refs.)

75885 Comments on 'Doppler time mapping' [J. Acoust. Soc. Am. 73, 1863-1864 (1983)]. D.W.Ricker (Appl. Res. Lab., Pennsylvania State Univ., State College, PA, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1864-5 (May 1983).

The subject paper presents an algorithm which compensates for transit time errors due to motion induced wave-front distortion which arises from motion normal to the line of sight between a projector and scatterer. This error is small in most practical applications and may, if necessary, be compensated for by a redefinition of the line of sight vector utilized by D.W. Ricker ['Echo waveform synthesis in a rapidly varying geometry', *ibid.*, vol. 72, p.1321-1323 (1982)]. (2 refs.)

75886 A novel electron beam recording material—poly(pentene-2 sulfone)—for real time display of acoustical frequency. Tang Keguang, Yang Yongyuan, Gao Zhimin, Feng Shujing, Wu Shikang (Inst. of Photographic Chem., Acad. Sinica, Beijing, China).

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.2, p.206-8 (Feb. 1983).

The authors report that poly(pentene-2 sulfone) films containing a photosensitive agent is a good electron beam recording material for real time acoustics. (6 refs.)

75887 A new wire phantom for accurate measurement of acoustic resolution. W.S.N. Trimmer, D.Vilkomerson (Technicare/Special Res. Group, Somerset, NJ, USA).

Ultrason. Imaging (USA), vol.5, no.1, p.87-93 (Jan. 1983).

Describes a phantom which is easier to use and gives more accurate results than a phantom made from several pairs of solid wires. This phantom employs two concepts: spatially modulated wires and diverging wires. Spatially modulated wires, such as helically twisted wires, reflect the sound into a broad range of angles. This has two advantages: (1) it is easier to align the transducer with the reflected beam, (2) the diffuse reflection is similar to the scattering from tissue, and the system gain need not be turned abnormally low. Diverging wires improve the accuracy and convenience of the measurement. Rather than many pairs of parallel wires, a single pair of wires which diverge from an apex is used. By scanning across this pair until the wires are just resolved, the resolution can be easily calculated. (3 refs.)

75888 Acoustical speckle interferometry. J.A.Schaeff, Jr. (US Army Missile Res. & Dev. Command, Redstone Arsenal, AL, USA).

In book: *International advances in nondestructive testing*. Vol.9, W.J.McGonagle [Ed.], p.17-76. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The basic theory for pulse-echo and continuous wave acoustical speckle interferometry was presented. This theory included the propagation of sound in an LSL interface with a scattering-reflecting layer below the interface. Also the method of scanning and cross-correlation using the square of the difference of two signals was presented. Two separate hardware systems were developed to make displacement predictions using the pulse-echo and continuous wave modes. These systems are very accurate and can make displacement measurements to within ± 0.001 inch using an XY-table with a 0.001 inch step increment. XY-tables with a smaller increment could improve these measurements by at least one order of magnitude. Pulse-echo acoustical interferometry was found to be sensitive to motion in three dimensions which may limit its usefulness since it requires scanning over an area to predict two-dimensional motion. Continuous wave acoustical speckle interferometry in contrast to pulse-echo scanning was found to be sensitive mainly to motion in two dimensions. (10 refs.)

43.88 TRANSDUCTION; DEVICES FOR THE GENERATION AND REPRODUCTION OF SOUND

75889 A piezoelectric displacement transducer for use in a pulse-shape based analysis of acoustic emission. J.Niewisch, P.Krammer (Siemens AG, Erlangen, Germany).

Sens. & Actuators (Switzerland), vol.3, no.3, p.187-93 (May 1983).

In order to assess the quality of the transducer, a measuring procedure is presented based on the comparison of the responses expected from theory with those actually measured. To a good approximation the transducer fulfills the requirements of a displacement transducer. (6 refs.)

75890 Development of a high intensity acoustic source. Ch'i Po-chun (Peking Inst. of Strength & Environment Engng., Peking, China).

Chin. J. Sci. Instrum. (China), vol.4, no.1, p.66-71 (Feb. 1983). In Chinese. Describes an acoustic generator with high power and wide bandwidth. The electropneumatic loudspeaker has power output up to 6000 acoustic watts. It can meet the needs for high intensity sound environmental test in astronautic and aeronautic engineering and is also suitable for long-distance music or speech transmission. The operational principle of the DQY-6000S electropneumatic loudspeaker is presented together with the elementary design theory and the characteristics of the vibration system. The method and data regarding the generator adjustments are given. (5 refs.)

75891 Measurement of vibration velocity distributions and mode analysis in thick disks of Pb (Zr,Ti)O₃. S.Ueha, S.Sakuma, E.Mori (Research Lab. of Precision Machinery Electronics, Tokyo Inst. of Technol., Yokohama, Japan).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1842-7 (May 1983). The vertical vibration velocity distributions and the frequency spectra of disk-type transducers with bevelled and unbevelled edges are measured as a function of the diameter-to-thickness ratio. In this experiment, transducers of Pb(Zr,Ti)O₃ are used and the diameter-to-thickness ratios are changed from 2 to 12. The frequency spectra are measured in the band from 1-700 kHz, and the velocity distributions are measured along the radial direction with an optical heterodyne technique. The theoretical frequency spectra are analytically derived from the wave equation of the disk-type transducer and compared to the experimental results. The theoretical velocity distributions are also proven to be true and to agree with the measured ones. (7 refs.)

75892 Pressure and pressure gradient fiber-optic lever hydrophones. F.W.Cuomo (Dept. of Physics, Univ. of Rhode Island, Kingston, RI, USA).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1848-57 (May 1983).

Fiber-optic levers have been found useful in the design of intracardiac pressure transducers, low-displacement biological measurements, and more generally as noncontact optical proximity detectors. In this paper the utilization of a bifurcated fiber-optical lever in the design of hydrophones of the pressure and pressure gradient types has been considered. This approach leads to simplicity, low cost, and relative ease in implementation. Some optical and acoustical considerations are given to establish the validity of the experimental data presented. It is shown that, with little effort, these devices can provide acoustic sensitivities at least equivalent to those of piezoceramic elements within the same frequency range and can generate acceptable directivity patterns in the pressure and pressure gradient modes. (18 refs.)

75893 Flexural disk hydrophones using polyvinylidene fluoride (PVDF) piezoelectric film: desensitization with increasing hydrostatic pressure. A.J.Holten, A.D.Parsons, A.E.J.Wilson (Plessey Res. (Caswell), AllenClarkRes.Centre.Ltd., Caswell, Towcester, England).

J. Acoust. Soc. Am. (USA), vol.73, no.5, p.1858-62 (May 1983).

A piezoelectric polymer polyvinylidene fluoride hydrophone was developed which shows significant desensitization as the hydrostatic pressure is increased from 0 to 0.62 MPa. The authors show theoretically and experimentally that this is due to the boundary of the disk changing from 'simply supported' to 'clamped'. They investigate ways in which this problem can be overcome using a profiled disk with rounded supports. (8 refs.)

75894 Variable amplitude, phase, and field shape ultrasonic transducers. J.W.Gray, R.O.Claus (Dept. of Electrical Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.416-20

A piezoelectric ultrasonic transducer with multiple electrodes is described. Control of both the amplitude and the phase of the signals applied to the individual electrodes of the transducer with variable spatial amplitude profiles. The specific example of a transducer with a two-dimensional Gaussian field profile that may be focused to a spot at a selected distance from the transducer surface is discussed. Both theoretical design criteria and experimental results are presented. (7 refs.)

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

75895 Regularisation of solutions of inverse heat conduction problem. V.M.Vigak.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.3, p.31-4 (1983). In Ukrainian.

One method of solution regularization is proposed for an inverse incorrect heat conduction problem. The question of constructing a stable solution is discussed. (6 refs.)

75896 Thermal effects in a long rotating cylindrical shaft of piezo-electric material with a concentric circular axial hole. K.K.Kundu (Ramakrishna Mission Sikshanamandira, Howrah, West Bengal, India).

Indian J. Theor. Phys., vol.29, no.3, p.281-9 (Sept. 1981).

A problem of thermal effects in a rotating cylindrical shaft with concentric circular hole has been considered. To solve such a problem the author makes use of the equation of elasticity, Maxwell's equations, and the equation of heat conduction in the steady state simultaneously and the other relevant constitutive relations have also been used. Finally, displacements in the r and z directions have been found. (8 refs.)

75897 Effective macroscopic description for heat conduction in periodic composites. J.L.Auriault (Inst. de Mecanique de Grenoble, Grenoble, France).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.861-9 (June 1983).

Effective parameters for the macroscopic behaviour of periodic composites are determined, concerning static or transient heat conduction, when the wavelength is large compared to the length of the period. Different situations are analysed using the homogenization method, which lead to different macroscopic descriptions: single classical partial differential equations, single integral partial differential equations with memory effect, systems of partial differential equations, etc. Some simple examples are given where analytical results are possible. (20 refs.)

75898 Heat flow through fiber-reinforced composite layer. V.T.Golovchan, V.I.Kushch (Inst. of Superhard Materials, Acad. of Sci., Kiev, Ukrainian SSR).

J. Eng. Phys. (USA), vol.43, no.3, p.995-1000 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.417-24 (Sept. 1982).

The problem of heat flow through a layer with a finite number of rows of periodically positioned fibers all oriented along the same direction is solved.

75899 Numerical method for solving the coupled problem radiative-convective and conductive heat transfer. Yu.K.Malikov, V.G.Lisienko, V.V.Volkov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.1035-41 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.467-74 (Sept. 1982).

The solution of the problem of complex heat transfer is reduced to a systematic solution of a system of nonlinear equations and the heat-conduction equations. A rapid iterative method is proposed for solving the system of equations. (5 refs.)

44.30 HEAT TRANSFER IN INHOMOGENEOUS MEDIA AND THROUGH INTERFACES

75902 Stefan problem with initial heat shock. I.I.Danilyuk.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.3, p.9-14 (1983). In Ukrainian.

The two-phase Stefan problem with a discontinuous initial temperature ('heat shock') is considered and reduced to three nonlinear equations. Three stages of a crystallization process are described—initial, middle and final. The existence theorem for small time values is also proved. (4 refs.)

75903 On the mechanism of macrolayer formation in nucleate pool boiling at high heat flux. A.M.Bhat (Mech. Engng. Dept., Regional Engng. Coll., Srinagar, India), R.Prakash, J.S.Saini.

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.735-40 (May 1983).

In nucleate boiling at high heat flux, a liquid layer, known as the 'macrolayer', is trapped between the heating surface and the vapour masses. An analysis of the mechanism of formation of this macrolayer is presented. Based on the analysis, a theoretical expression has been derived for the initial thickness of the macrolayer. The agreement between the theoretical values of the initial macrolayer thickness and the experimental values published in the literature is reasonably good. (11 refs.)

75904 A second law analysis of the concentric tube heat exchanger: optimisation of wall conductivity. K.Chowdhury, S.Sarangi (Advanced Centre for Cryogenic Engng., Indian Inst. of Technol., Kharagpur, India).

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.783-6 (May 1983).

Investigates the effect of axial heat conduction on the performance of concentric tube counterflow heat exchanger and derive an expression for the optimum thermal conductivity of the partition wall. (10 refs.)

75905 An analysis of substrate heat losses in Stefan's problem with a constant flux. B.Jayaram, W.Strieder (Univ. of Notre Dame, Notre Dame, IN, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.786-90 (May 1983).

In the present study the heat balance integral method is used to obtain melting rates and heat losses into the substrate for the melting of a semi-infinite solid on a conducting substrate, both initially at the solid melting temperature, by a constant uniform heat source at the substrate interface. Results show that in many cases the latent heat sink will significantly reduce substrate heat losses on melting. (10 refs.)

75906 Boiling on a finned tube and a finned tube bundle. E.Hahne, J.Muller (Inst. fur Thermodynamik und Warmetech., Univ. Stuttgart, Stuttgart, Germany).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.849-59 (June 1983).

An experimental investigation was carried out in a 151 dm³ container in R 11, at saturation state of 1 bar and 23.3°C. The heat transfer coefficients measured on a single tube in the container, resembled approximately results for the case that only one tube is heated within an in-line 18 tube bundle. For a twin tube arrangement, the heat transfer coefficient of the upper tube is up to 80% higher than that of the lower tube. The heat transfer curve of this upper tube represents quite well the heat transfer coefficients of tubes enclosed in the bundle. Only for the bottom and top tubes of the bundle differences do occur. The possibility to obtain tube bundle data, at least to some extent, by much simpler twin-tube or triple-tube experiments would facilitate experimental investigations. (20 refs.)

75907 Heat liberation during vapor condensation in a thermosiphon. N.I.Mirmov, I.G.Velyakova (V.V. Kuibyshev Arkhangel' Forest Technol. Inst., USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.970-4 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.385-90 (Sept. 1982).

A method is described for calculation of the heat-transfer coefficient during condensation of vapor of single component and binary heat-transfer agents in a thermosiphon. Results of processing experimental data are presented. (10 refs.)

44.40 RADIATIVE HEAT TRANSFER

75908 Thermal performance of radiative cooling panels. P.Berdahl, M.Martin, F.Sakkal (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.871-80 (June 1983).

The performance of panels which cool by means of thermal infrared heat transfer to the sky is calculated from basic principles. The efficiency of a radiative cooling panel is defined. Computer calculations with the full heat transfer equations are performed for horizontal surface with infrared-transparent covers. Plots of efficiency versus a dimensionless temperature difference are shown to be insensitive to variations in air temperature, wind speed, and sky radiance resulting in plots analogous to standard efficiency curves for solar panels. Experimental measurements show that, for most applications, white paint is a better radiator than aluminized polyvinyl fluoride film. (38 refs.)

75909 Source function expansion for radiative transfer in an anisotropically scattering slab with reflecting boundaries. S.M.Shouman, M.N.Ozisik (Dept. of Nuclear & Mech. Engng., North Carolina State Univ., Raleigh, NC, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.951-3 (June 1983).

The source function expansion method is applied for the solution of radiation transfer in an anisotropically scattering plane parallel slab. The authors consider radiative heat transfer for azimuthally symmetric, gray, absorbing, emitting, anisotropically scattering, plane-parallel slab with specularly reflecting boundaries confined to a medium $-L \leq x \leq L$ measured in the optical variable x . (5 refs.)

75910 A calorimetric method for the measurement of the Stefan-Boltzmann constant. D.Giulietti, M.Lucchesi (Istituto di Fisica, Univ. di Pisa, Pisa, Italy), L.Galgani.

Nuovo Cimento B (Italy), vol.74B, ser.2, no.2, p.187-98 (11 April 1983).

Presents a new calorimetric method for the determination of the Stefan-Boltzmann constant σ at the melting point of ice. The method is completely unaffected by problems related to diffraction effects, which limited the accuracy of most previous experiments in σ determinations. (17 refs.)

75916 The balanced form laminate. Liu Xi-li (Harbin Civil Engng. Inst., Harbin, China).

Acta Mech. Solida Sin. (China), no.1, p.23-33 (1982). In Chinese.

The balanced form of laminate is discussed on the basis of classical lamination theory. The generalized balanced form conditions applicable to the laminate theory as well as the netting theory are derived. The mechanism of the balanced form is explained. The balanced form is the ply form for which the relative stretches in all directions in the plane of the laminate are equal. The method for calculating stress and strain of balanced form laminate is discussed. By introducing the concept of balanced strain, the balanced form of laminates composited with metal lamina is treated. The balanced form formulas for the netting theory are given in tables. Results of the study can be applied to laminates reinforced by one kind of fiber as well as to the hybrid laminates reinforced by many kinds of fiber. (4 refs.)

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.1, p.32-5 (1983). In Ukrainian.

Presents results of an experimental check of theoretical formulas obtained earlier for critical loads. (7 refs.)

75918 Solution of problems on the stressed state of an inhomogeneous hollow cone. Ya.M.Grigorenko, A.T.Vasilenko, N.D.Pankratova.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.1, p.38-42 (1983). In Ukrainian.

Suggests an approach to determine the stressed state of an infinite multilayer hollow cone affected by symmetric and asymmetric loads changing according to the polynomial laws. (7 refs.)

75919 Green's function of an elastic ring bounded by similar epitrochoids of class-2 and clamped along each boundary. R.S.Dube (Dept. of Math., Ranchi Univ., Ranchi, India).

Indian J. Pure & Appl. Math., vol.14, no.3, p.362-76 (March 1983).

An expression is found for the transverse displacement due to an isolated load in a thin elastic ring bounded by similar epitrochoids of class-2 and clamped along each boundary. The displacement is found as an infinite convergent series and the unknown coefficients are determined by applying a condition of convergence (Singh 1960). (4 refs.)

75920 Design for minimum stress concentration by finite elements and linear programming. P.Pedersen, C.L.Laursen (Dept. of Solid Mech., Tech. Univ. of Denmark, Lyngby, Denmark).

J. Struct. Mech. (USA), vol.10, no.4, p.375-91 (1982-1983).

The problem of design for minimum stress concentration is highly nonlinear and must be solved iteratively. Each iteration (redesign) involves three steps: an analysis of the stresses for a design, a sensitivity analysis corresponding to possible changes in this design, and the decision of redesign. For stress analysis, the FEM is a unified approach which is applied to axisymmetric solids that are also subjected to nonaxisymmetric loads. The decision of redesign is a linear programming problem and can thus be solved with the Simplex algorithm. The introduction of move-limits to the formulation is of major importance. The optimization approach is described in general, but most of the paper concentrates on a specific example and shows optimum shapes of a shoulder fillet in a stepped bar. Loads are bending, tension, or torsion, and the stress concentrations are considerably reduced. (7 refs.)

75921 A set of strain-displacement relations in nonlinear theories of rods and shells. A.Maewal (Dept. of Mech. Engng., Yale Univ., New Haven, CT, USA).

J. Struct. Mech. (USA), vol.10, no.4, p.393-401 (1982-1983).

The direct approach of Reissner (1973, 1974) and of Simmonds and Danielson (1972) is used to derive polynomial approximations to the strain-displacement relations in nonlinear theories of rods and shells via the representation of the finite rotational displacement matrix in terms of the exponential of an antisymmetric matrix. (8 refs.)

75922 Singularity of contact-edge stress in laminated composites under uniform extension. R.I.Zwiers, T.C.T.Ting (Dept. of Civil Engng. & Metall., Univ. of Illinois, Chicago, IL, USA).

J. Compos. Mater. (USA), vol.17, no.1, p.49-63 (Jan. 1983). [received: June 1983]

The unusually large and possibly infinite stress at the contact-edge is one of the factors responsible for delamination when the composite is subjected to external loading. The authors study the stress singularities at the contact-edge of an interface between two adjacent layers in a laminated composite. Each layer of the composite is assumed to be of the same orthotropic material with one of the principal axes being the fiber direction. However, the angle θ which is the fiber orientation varies from layer to layer. The composite is subjected to uniform extension in the plane of the layers. It is shown that a singularity of the type $k r^{\delta}$ ($\delta < 0$) may exist, but that it depends on the stacking sequence of the layers and the complete boundary conditions. (12 refs.)

46.30C Static elasticity

75923 Variational principles of finite deformation of elasticity in nonconservative systems. Xiong Yaoxi (Peking Inst. of Aeronaut. & Astronautics, Peking, China).

Acta Mech. Sin. (China), no.1, p.86-90 (1983). In Chinese.

Starting from the theorem of virtual work in finite elastic deformation, the author establishes and proves quasi-variational principles of finite elasticity suitable for general nonconservative systems. (4 refs.)

75924 Some basic problems and engineering applications of boundary integral equation-boundary element method in elasticity. Du Qing-hua, Yao Zhen-han (Dept. of Engng. Mech., Qinghua Univ., China).

Acta Mech. Solida Sin. (China), no.1, p.1-22 (1982). In Chinese.

The direct boundary integral equation-boundary element method in elasticity is developed by inner product forms of weighted residual processes. The formulations are first established for potential problems, elastostatic problems and Kirchhoff's plate problems with the restriction of Liapunov boundary regular surfaces. The variational functionals are also given and the corner conditions are discussed. By proper treatment of the specific fundamental solutions and numerical discretizations a series of concrete problems are solved. The results of the investigation include: torsional problem of shafts with variable diameter, axial loading of axial symmetric bodies, bending of axial symmetric bodies and the plate bending problems. The investigation also showed that such numerical results are necessary for improving and increasing the accuracy of the useful engineering data on stress concentration and plate problems (including the cases of free boundaries and corner points). (39 refs.)

75925 On the problem of a ribbon-like rigid inclusion in a micropolar elastic space. M.Kaciewicz, S.Matysiak (Acad. Polonaise des Sci., Warsaw, Poland).

Bull. Acad. Pol. Sci. Ser. Sci. Tech. (Poland), vol.30, no.1-2, p.11-20 (1982).

The problem of a ribbon-like inclusion in a micropolar elastic space is considered. Singularities of stresses at the ends of the inclusion are investigated and compared with results for the problem of a crack. (12 refs.)

75926 Local stress-deformed state near sharp elastic inclusions in an isotropic plate. L.T.Berezhnitskii, I.T.Denisyuk.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.3, p.27-31 (1983). In Ukrainian.

An elastic equilibrium problem solution is presented for an anisotropic plate containing a sharp-pointed anisotropic elastic inclusion. The stress tensor and displacement vector asymptotic representation for the matrix is established in the vicinity of the inclusion tip. It is shown that the local stress field consists of hard and soft components. (7 refs.)

75927 Elastic equilibrium of channel shells with planar curvilinear centre lines. Ya.M.Grigorenko, V.I.Gulyaev, E.A.Gotsulyak, K.Ashuri.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.3, p.38-41 (1983). In Ukrainian.

Methods of differential geometry were used to analyze geometric properties of cyclic surfaces determining tube shells. The effect of geometric parameters on the stress-strain state of the tubes is investigated on the basis of the moment theory of shells. It is shown that deformation of the line of centres results in a considerable increase in the maximum values of stress and strain fields. (8 refs.)

An elastic-plastic analysis of notched plates subjected to tension force or bending moment was made. Based on this analysis, methods of evaluating approximately the stress and strain at the notch root were proposed. Dimensionless master curves were proposed for estimating the stress and strain concentration factors under small-scale yielding condition and the stress and strain at the notch root under large-scale yielding condition. A simple formula was further developed by which the stress and strain at the notch root could approximately be calculated under load conditions below and above the gross yield stress by using the J-integral, together with a formula for estimating the J-integral. - 75932 Creep transition of transversely isotropic cylinder under internal pressure. S.K.Gupta, V.D.Rana (Dept. of Math., Himachal Pradesh Univ., Simla, India). *J. Math. & Phys. Sci. (India)*, vol.16, no.5, p.499-505 (Oct. 1982). [received: May 1983]
Derives the transitional stresses for a transversely isotropic thick-walled cylinder under internal pressure for three stages of creep. It has been shown that for vanishing anisotropy, the creep stresses are the same as those given by Gupta and Dharmani (1979) for a compressible material and by Bailey (1951) and Odqvist (1974) for an incompressible material. Numerical results for a thick-walled cylinder made of beryl have been depicted graphically. For elastic material, the curves obtained are the same as given by Marin (1966). (15 refs.)
- 75933 On dynamical description of fiber reinforced composites. G.Tolf (Dept. of Mech., Royal Inst. of Technol., Stockholm, Sweden). *J. Compos. Mater. (USA)*, vol.17, no.1, p.77-90 (Jan. 1983). [received: June 1983]
In the attempts to describe the dynamical behaviour of fiber reinforced composites, various models have been proposed. Most of these make the assumption that on the microlevel either the fibers can be regarded as rigid or the displacements vary in a prescribed way, mostly linear, so that the composite on the macrolevel can be described by fields that represent rigid translations and rotations of the midpoint of the fiber. A model of quadratic, linearly elastic fibers in a quadratic array of a linearly elastic matrix is proposed to find out when these assumptions are made legitimate. Comparison is made to the models mentioned above. It is found that the difference in stiffness can be rather small for these assumptions to be valid, but the dispersion in the lowest mode, i.e. the translational mode of the fiber, is due not to coupling with a rotational mode but to a deformation of the fiber. Also, as seen in the models assuming rigid fibers, it is found that the constants in the power expansion of the dispersion relation depend linearly on the stiffness ratio between fiber and matrix. (10 refs.)
- 75934 Bounds on displacements for elastoplastic structures by the application of energy methods. M.Capurso (Univ. di Bologna, Istituto di Sci. delle Costruzioni, Bologna, Italy). *J. Struct. Mech. (USA)*, vol.10, no.4, p.403-17 (1982-1983).
Structures composed of an elastoplastic rate-insensitive material subjected to high intensity dynamic transient disturbance are considered. A general inequality which bounds displacements from above is presented. This property allows for a meaningful approach to the problem by means of a 'holonomic' solution of the structure subjected to static fictitious loads. A simple application is presented. (14 refs.)

- 75935 Development of the concept of slip in the theory of plasticity. M.Ya.Leonov, B.A.Rychkov (Inst. of Automation, Acad. of Sci., Frunze, USSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.291-9 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.3-12 (July-Aug. 1982). [received: May 1983]
In formulating the basic positions of the theory of plasticity it is more natural to start not from the conditions of plasticity (the surface of loading) but from the relationships between stresses and deformations, which are provided by an experiment. The authors supplement such an approach, developed by A.A. Il'yushin, by construction of a simplified mechanism of plastic deformation (slip). The concept of slip leads to the understanding of the resistance to shear, an alternative to the understanding of the surface of loading. (12 refs.)
- 75936 Inelastic deformation of materials. K.N.Rusinko (Lenin Komsomol L'vov Polytech. Inst., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.315-19 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.30-5 (July-Aug. 1982). [received: May 1983]
On the basis of physical concepts variations of the theory of inelastic deformation occurring with time are considered. If fulfillment of the Drucker postulate is taken as the criterion of truth of the variant of the tensor of plasticity, then the theory of slip and the theory of flow (with a regular surface of loading) lead to opposite results. According to the theory of flow, the difference in resistance may be determined only by the level of stresses, and according to the theory of slip, it may not be determined only by the value of stresses. (11 refs.)
- 75937 An asymptotic of a bend of a thin ligament under small loads. T.Ya.Ershova. *Vestn. Mosk. Univ. Ser. 1 (USSR)*, no.2, p.83-7 (March-April 1983). In Russian.
The behaviour of a thin ligament is studied considering geometric nonlinearity. It is shown that the stress concentration factor depends on the tensile load N . When the load is small enough ($N \sim \delta^2$, $\alpha > 2$) the value of the stress concentration factor in the first approximation is the same as in the linear case. (5 refs.)

- 75938 Note on the optimal design to the stability of clamped column under axial compression. Chueng Kengtung, Zhong Wanxie (Res. Inst. of Engng. Mech., Dalian Inst. of Technol., China). *Acta Mech. Sin. (China)*, no.1, p.45-53 (1983). In Chinese.
The optimal design of clamped column under axial compression is a classical problem. Instead of the single buckling mode criterion, as Olhoff and Rasmussen (1976) pointed out that therein two buckling modes associated with the criterion of the degenerate case must be considered. Olhoff has also deduced the necessary condition for this criterion and solved the clamped optimum column problem. But one can find that the Olhoff condition is somewhat vague. According to the theory of eigenvalue problems, if eigenvectors y_1 and y_2 correspond to the same eigenvalue λ , then any linear combination of them $\tau y_1 + \beta y_2$ is also an eigenvector. But if $y_{1a} = y_1$ and $y_{2a} = \tau y_1 + \beta y_2$ are substituted into the criterion it is found that the equality will be violated in some cases. The sensitivity analysis of the optimal degenerate design is carried out first. (5 refs.)
- 75939 Ultimate strength of sandwich panels with a honeycomb core. Zhou Zhulin (Shuanghai GRP Res. Inst., Shanghai, China). *Acta Mech. Sin. (China)*, no.1, p.62-9 (1983). In Chinese.
Sandwich panels with a honeycomb core are structural members composed of thin plates. Local instabilities of sandwich panels with honeycomb core may be classified into three types: wrinkling, shear buckling, and intra-cellular buckling. The theoretical analysis of wrinkling is based on the assumption that the compressive faces can be treated as the local instability of a plate attached to an elastic medium. Considering initial irregularities and shear deformation of the faces, the author calculates the stress in the cores and the adhesive layers; then uses Mohr's strength theory to get the ultimate strength of the faces when cores or adhesive layers are destroyed. (11 refs.)
- 75940 Bifurcation of an obliquely fiber-reinforced elastic slab under axial loads. M.Kurashige (Dept. of Mech. Engng. II, Tohoku Univ., Sendai, Japan). *Bull. JSME (Japan)*, vol.26, no.213, p.347-50 (March 1983).
In the framework of the theory of continua with kinematical constraint of inextensibility, bifurcation from homogeneous finite deformation of an obliquely fiber-reinforced elastic slab under axial loads, both tensile and compressive, is studied. The matrix is assumed to be Blatz-Ko foam rubber. In spite of the uniform axial stress loading, the initial homogeneous deformation consists not only of axial extension or contraction but also of pure shear deformation owing to the oblique reinforcement. The bifurcation is analyzed on the basis of the incremental deformation theory. For various wavelength-to-thickness ratios, the critical loads are shown in the form of curves as a function of fiber inclination. (8 refs.)
- 75941 Buckle pattern of biaxially compressed simply supported orthotropic rectangular plates. C.Libove (Dept. of Mech. & Aerospace Engng., Syracuse Univ., Syracuse, NY, USA). *J. Compos. Mater. (USA)*, vol.17, no.1, p.45-8 (Jan. 1983). [received: June 1983]
Simply supported orthotropic elastic rectangular plates in biaxial compression are considered, and it is proved that such plates will buckle with m or n (or both) equal to 1, where m and n are the number of half waves in the two principal directions. While this theorem may be known to many as an empirical computational fact, it does not appear to have been explicitly stated or proved heretofore in the literature on orthotropic plates. (3 refs.)

75942 Study on failure of pipes with multiple thinned parts by external pressure. T.Shibata, T.Nomi, H.Nakai (Faculty of Engng., Kyoto Univ., Kyoto, Japan). *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.32, no.354, p.298-303 (March 1983). In Japanese.

The buckling strength of a thin pipe under external pressure has been theoretically analyzed by von Mises. However, the strength of a thin pipe with locally thinned parts has not been studied. It was shown previously (1979) that the buckling strength for such a pipe decreases when compared with a pipe having no thinned part. Also it was suggested that a specimen having two thinned parts may show lower strength than a specimen with a single thinned part. Experiments were carried out in order to check the above suggestion by using the specimens having no pipe end restriction to deformation. The experimental results did not show any dependence of strength of the number of thinned parts, and this was explained by the stress distribution in the pipe. (4 refs.)

75943 Ponding instability of cylindrical air-supported membranes under nonsymmetrical loadings. S.Lukasiewicz, P.G.Glockner (Dept. of Mech. Engng., Univ. of Calgary, Calgary, Alberta, Canada). *J. Struct. Mech. (USA)*, vol.10, no.4, p.419-35 (1982-1983).

Deals with the stability of a cylindrical air-supported membrane subjected to an eccentric line load and an accumulating ponding fluid in the depression caused by the load. A critical value of the load is calculated by solving the equations of equilibrium for the structure. Results of the analysis indicate that the eccentricity causes a significant increase in the value of the critical load. The elastic properties of the membrane are included in the analysis which leads to slightly lower critical loads than the corresponding 'inextensional' membrane case. (3 refs.)

75944 The effect of multiple buckling modes on the postbuckling behavior of plane elastic frames. I. Symmetric frames. M.Pignataro, N.Rizzi (Istituto di Sci. delle Costruzioni, Univ. di Roma, Rome, Italy). *J. Struct. Mech. (USA)*, vol.10, no.4, p.437-58 (1982-1983).

The postbuckling behavior of a one-bay, two-storey frame with built-in edges and symmetric with respect to midspan is analyzed. Columns are assumed to be inextensible and shear-undeformable, and beams are rigid. Then two buckling modes are possible, that is, sideways of the lower floor with rigid horizontal displacement of the top floor and sideways of the top floor with the lower floor undergoing no displacement. Obviously, the two buckling modes occur simultaneously if the ratios EI/h^2 (EI being the bending stiffness of a column and h its length) are properly selected. Within the framework of a Koiter-type energy approach a suitable perturbation formulation is derived from a 'hybrid' functional which is obtained by adding to the potential energy certain extra terms which account for the nonlinear energy associated with the internal forces applied to the beam at the joints. Results show that the postbuckling behavior of a single buckling mode can be stable or unstable according to the value of the ratio h/l , where l is the frame span. (25 refs.)

75945 The effect of multiple buckling modes on the postbuckling behavior of plane elastic frames. II. Asymmetric frames. N.Rizzi, M.Pignataro (Istituto di Sci. delle Costruzioni, Univ. di Roma, Rome, Italy). *J. Struct. Mech. (USA)*, vol.10, no.4, p.459-74 (1982-1983).

For pt.1 see *ibid.*, vol.10, no.4, p.437-58 (1982-83). The postbuckling behavior of an asymmetric one-bay, two-storey frame with clamped edges is analyzed. Columns have different bending stiffnesses and are pairwise of the same length. By assuming columns to be inextensible and shear undeformable, and beams to be rigid, two buckling modes are possible which are described by the sideways of the lower floor with a rigid horizontal displacement of the upper floor and a sideways of the upper floor, the lower floor undergoing no displacement. By properly selecting the ratios EI/h^2 (EI being the bending stiffness of a column and h its length) the two buckling modes may occur simultaneously. A third buckling mode is also possible but this third case is not considered. The Koiter general nonlinear theory of elastic stability recast in a form convenient for the development of finite element models has been employed. Column constraints on the field variable ϕ (ϕ being the cross-section rotation) are accounted for by means of Lagrangian multipliers. Results show that the postbuckling behavior of a single buckling mode is always asymmetric unstable and depends both on the degree of asymmetry of the structure and on the ratio h/l , l being the frame span. (19 refs.)

75946 Local buckling of thin tensioned plate with a crack. T.Fujimoto, S.Sumi (Dept. of Aeronaut. Engng., Kyushu Univ., Fukuoka, Japan). *Mem. Fac. Eng. Kyushu Univ. (Japan)*, vol.42, no.4, p.355-70 (Dec. 1982). [received: May 1983]

The local buckling characteristics of elastic plates with a central crack subjected to uniaxial tensile load are analysed by the finite element method based on the linear bifurcation theory. The boundary element method is applied to the analysis of the two dimensional stress field in the pre-buckling state, associated with the buckling analysis. The predicted buckling loads and modes are compared with the experimental results. The accuracy of analysis of the in-plane stress distribution near a crack is also discussed in conjunction with the behavior of local buckling. (25 refs.)

75947 Stability of strengthened toroidal shell segments under the uniform external pressure. A.V.Netrebko. *Vestn. Mosk. Univ. Ser. I (USSR)*, no.2, p.100-3 (March-April 1983). In Russian.

In considering the stability, the author uses the Newton-Raffson method for solving the nonlinear stability equations for a toroidal shell. The influence of the support on the magnitude of the critical load and the shape of the deflection is also studied. (4 refs.)

75948 Dynamical characteristics of structures with eccentricity and lateral transmission effect under forced vibration. Wang Yun-jian (Inst. of Engng. Mech., Acad. Sinica, Beijing, China). *Acta Mech. Solida Sin. (China)*, no.1, p.53-63 (1982). In Chinese.

Discusses the effects of eccentric structure, mass center position vibration in the direction of the inertial major axis on the dynamical characteristics. The author also investigates the effect of lateral response under forced vibration. (2 refs.)

75949 Vibrations of Mindlin's circular plates with variable thickness. K.Suzuki (Faculty of Engng., Yamagata Univ., Yonezawa, Japan), T.Yamaguchi, Y.Hirano, T.Kosawada, S.Takahashi. *Bull. JSME (Japan)*, vol.26, no.213, p.424-31 (March 1983).

The vibrations of circular plates with variable thicknesses are studied by the method of Mindlin's thick plate theory. An exact solution of circular plates with a hole is obtained. The effects of some parameters on frequencies are

discussed and the present theory is compared with the classical theory. (17 refs.)

75950 Radial vibration of a thin circular composite plate of variable modulus of elasticity and variable density with a central hole. S.Bhaduri (Inst. of Theoretical Phys., Calcutta, India), B.R.Pal. *Indian J. Theor. Phys.*, vol.29, no.3, p.239-45 (Sept. 1981).

The extensional vibration of a thin circular composite annulus plate of nonhomogeneous isotropic material, in which both the density and the modulus of elasticity are variable, has been considered here. (8 refs.)

75951 Vibrations of cantilevered circular cylindrical shells: shallow versus deep shell theory. J.K.Lee, A.W.Leissa, A.J.Wang (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA). *Int. J. Mech. Sci. (GB)*, vol.25, no.5, p.361-83 (1983).

Free vibrations of cantilevered circular cylindrical shells having rectangular plan forms are studied by means of the Ritz method. The deep shell theory of V.V. Novozhilov (1964) and A.L. Goldenveizer (1961) is used and compared with the usual shallow shell theory for a wide range of shell parameters. A thorough convergence study is presented along with comparisons to previously published finite element solutions and experimental results. Accurately computed frequency parameters and mode shapes for various shell configurations are presented. The present paper appears to be the first comprehensive study presenting rigorous comparisons between the two shell theories in dealing with free vibrations of cantilevered cylindrical shells. 75952 The near-tip displacement fields for a mode-III crack in steady growth in an elastic perfectly-plastic medium. Hwang Kehchih, Dai Yao (Tsinghua Univ., China). *Acta Mech. Sin. (China)*, no.1, p.77-80 (1983). In Chinese.

Chitaley and McClintock (1971) have given the asymptotic near-tip stress field expressions for strains in integrals and a numerical solution for small-scale yielding for a mode-III crack growing steadily in an elastic perfectly-plastic medium. As pointed out by Rice (1975), the numerical results for the crack-opening displacements, equal to $0.15 k_{III}^2/kG$ at the tip (k_{III} —stress intensity factor, k —shear yield stress, G —shearing modulus), are questionable. Here, the asymptotic expressions for the plastic strains γ_x^p , γ_y^p and W are given for the active loading zone ($0 \leq \theta \leq \theta_0$), for the unloading zone ($\theta_0 \leq \theta \leq \pi - \theta_0$) and for the reloading zone ($\pi - \theta_0 \leq \theta \leq \pi$). (3 refs.)

75953 A correct Taylor series methods in determining the mixed mode SIF using photoelastic field data. Du Jiaji, Jia Youquan (Tianjin Univ., Tianjin, China). *Acta Mech. Sin. (China)*, no.2, p.185-96 (1983). In Chinese.

When considering the mixed-mode condition where both K_I and K_{II} occur together the photoelastic fringe loops are not always symmetrical at the tip of crack. The Taylor series correction method was applied to mixed-mode problems. The data used to determine stress intensity factors were measured simultaneously at several rays which intersected the fringe loops and originated from the crack tip. The least squares method was employed to reduce the errors. (8 refs.)

75956 Effect of combined stresses on contact fatigue. Wen Shizhu. *Chin. J. Mech. Eng. (China)*, vol.18, no.4, p.1-7 (Dec. 1982). In Chinese. [received: May 1983]

By using the statistical technique of experiment and treating data, the effect of combined stresses on contact fatigue is investigated. The superimposed tensile bending stress markedly shortens the process of fatigue, but the effect of compressive stress is dependent on its magnitude. A small superimposed compressive bending stress can increase the fatigue life, while a large compressive bending stress decreases it. There is a critical compressive bending stress at which the fatigue life becomes maximum. According to the experimental results, the author attempts to analyze the availability of some hypotheses of decisive stress for estimation of contact fatigue, and indicates that taking the maximum surface shear stress as the decisive stress is more suitable than others. It seems that the initiation of combined stressed contact fatigue takes place at the surface. (8 refs.)

75957 Distribution of pressure necessary to produce Griffith cracks of prescribed shape in an orthotropic medium. A.K.Das, B.Behera (Dept. of Maths., Regional Engng. Coll., Rourkela, India). *Indian J. Technol.*, vol.20, no.11, p.419-26 (Nov. 1982). [received: May 1983]

The author considers the problems of determining the distribution of surface stresses necessary to produce Griffith cracks of prescribed shape in (i) an infinite orthotropic plane, and (ii) an infinite orthotropic strip of finite width. The analytical expression for crack energy necessary to produce Griffith cracks of prescribed shape has been determined. The numerical calculations of the required pressure have been made taking into account the values of constants for boron-epoxy composite and some isotropic material. (9 refs.)

75958 Two coplanar Griffith cracks in an orthotropic semi-infinite medium. R.B.Mohapatra, H.Parhi (Regional Engng. Coll., Rourkela, India). *J. Math. & Phys. Sci. (India)*, vol.16, no.6, p.545-63 (Dec. 1982). [received: May 1983]

The authors consider the problem of determining the stress-intensity factors in a semi-infinite orthotropic elastic medium containing two coplanar cracks, parallel to the boundary. They assume that the cracks are opened by constant internal pressure and that the free edge of the medium is rigidly clamped. The mixed boundary conditions lead to two sets of triple integral equations, which are solved by using Finite Hilbert transform technique. Analytical expressions up to h^{-8} are derived for stress-intensity factors where h , which is much greater than 1, is the distance of the cracks from the free boundary. Numerical calculations for a fibre-reinforced composite material and an isotropic material are carried out and the effect of orthotropy on the stress intensity factors is reported. (10 refs.)

75959 Finite element analysis of surface crack configuration obtained by electrical potential method. S.Sakata, M.Hayashi, T.Shimizu, S.Shida (Mech. Engng. Res. Lab., Hitachi Ltd., Hitachi, Japan). *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.32, no.354, p.334-9 (March 1983). In Japanese.

Finite element procedures were used to discuss the practicality of the electrical potential technique for monitoring the surface crack of a plate. The analysis applied to solve the potential field problems involves the solution of the Laplace equation. Analytical figures were modeled as three-dimensional bodies using eight-nodes isoparametric elements. A computer program ADI-NAT was employed in the study. From finite element analyses, the following method of determining surface crack configurations was proposed. The electrical potential ratio is determined first at several positions from a crack center and the relationship between electric potential ratio and distance from a crack center is obtained. By assuming that a surface crack takes a half elliptical configuration, the crack length c at the surface can be estimated from the relation between the crack area ratio and the distribution of electrical potential ratio from a crack center. The crack depth a can then be determined from the distribution of the normalized electrical potential ratio. (4 refs.)

75960 Fatigue and fracture mechanics. T.V.Duggan (Mech. Behaviour of Materials Lab., Portsmouth Polytech., Portsmouth, England). *Phys. Technol. (GB)*, vol.14, no.3, p.126-32 (May 1983). The formation and behaviour of cracks are first examined and their influence on the mechanical integrity of components is stressed. A wide variety of physical and environmental factors which affect modern design methods are discussed. (9 refs.)

75961 Use of the finite-element method in fracture mechanics. E.M.Morozov, G.P.Nikishkov (Moscow Engng. Phys. Inst., Moscow, USSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.299-314 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.13-29 (July-Aug. 1982). [received: May 1983]

It is possible to distinguish various aspects of the use of the finite-element method in problems of fracture mechanics. First, calculation of the parameters controlling fracture (stress intensity factors, the contour J-integral, etc.) for areas of different form. Second, simulation of the processes of fracture or of the behavior of bodies with a stationary crack under conditions for which adequate mathematical models have not yet been constructed. Calculation experiments in combination with full-scale ones are especially successful. Third, analysis of the strength of actual structures from the point of view of the resistance to brittle fracture on the basis of the finite-element method is extremely important for practical purposes. (80 refs.)

75962 Mathematical models of fatigue crack growth. S.Ya.Yarema, L.S.Mel'nichok (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.337-43 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.55-61 (July-Aug. 1982). [received: May 1983]

Cyclic crack resistance tests of materials include measurements of the crack length l_i in the sample and of the corresponding number of load cycles N_i with a specified periodically changing load. The set of data $\{l_i, N_i\}_{i=1}^m$ is subjected to primary treatment to determine the pairs of values: the crack growth rate $v = \Delta l / N$ and the maximum stress intensity factor K_{\max} or its range ΔK . The block of data obtained $\{v_i, K_i\}_{i=1}^m$ is represented in a system of coordinates with logarithmic scales ($\log v$ vs. $\log K$) by points, the combination of which is called the experimental fatigue failure curve. In the second stage of treatment the $\{v_i, K_i\}_{i=1}^m$ block is described by an analytical expression of the specified form $v = f(\alpha_1 v_m, \dots, \alpha_m, K)$, which is a mathematical model of fatigue crack growth. (12 refs.)

75963 Distribution of stresses and displacements near a crack in a homogeneous body with straight-line anisotropy of general form. V.V.Panas-yuk, L.T.Berezhnitskii, M.E.Chaplya (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.343-9 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.61-9 (July-Aug. 1982). [received: May 1983]

Many constructional composite materials are considered as a first approximation as homogeneous with anisotropy of the elastic and strength properties. In the case of straight-line anisotropy it is possible to obtain condition of boundary problems of the theory of elasticity with the use of methods of the theory of functions of a complex variable. (11 refs.)

75964 Plane problems of finite regions containing multiple cracks. M.Isida, H.Tsuru.

Technol. Rep. Kyushu Univ. (Japan), vol.55, no.6, p.649-56 (Dec. 1982). In Japanese. [received: May 1983]

Deals with the analysis of the crack tip stress intensity factors of the following problems: (1) An infinite row of edge cracks on the side of a strip under tension. (2) Infinite rows of edge cracks on both sides of a strip under tension. (3) Edge cracks on both sides of a plate under tensions of stress, displacement and concentrated loading types. (4) An infinite row of collinear cracks in the middle of a strip under tensions of stress and displacement types. The stress function is based on the eigenfunction expansions of the complex potentials satisfying the traction free conditions along the crack edges. The unknown coefficients are determined with the modified boundary collocation technique in which the stress resultant or displacement of each segment is required to take assigned values, and the stress intensity factor is calculated from the obtained stress function. The accuracy of the proposed method is shown to be excellent by checking the convergence of the numerical values with increasing values of the number of the segments. (8 refs.)

75965 Behaviour of cracks in a plate considering residual stresses. R.Wille.

Vestn. Mosk. Univ. Ser. 1 (USSR), no.2, p.91-5 (March-April 1983). In Russian.

A plate of finite breadth with one surface crack is considered. There are some residual stresses distributed in the plate. The author computes the intensity coefficient for different depths of the crack and different distributions of residual stresses. The position of the closed crack is found in the zone of pressing stresses. The results of the computation are analyzed and compared with analytical solutions for a half-plane with a crack perpendicular to the boundary. (3 refs.)

75966 Contact stresses in two elastic bodies. (Elastic bodies are rectangular plates). Y.Minakuchi (Faculty of Engng., Yamanashi Univ., Takeda, Kofu, Japan), T.Sawa, K.Yoshimine, T.Koizumi. *Bull. JSME (Japan)*, vol.26, no.213, p.340-6 (March 1983).

The contact problem of two laminated dissimilar rectangular plates subject to an arbitrary symmetric loading is considered. The two dimensional theory of elasticity is used to analyse the contact stress and the deformation between the rectangular plates. By neglecting shearing stress on the contact surface, an exact solution satisfying the remaining boundary conditions is obtained. Numerical calculations are carried out for various rigidities and thicknesses of the plates under various loading conditions. In order to examine the results of the theoretical analysis the contact stress is measured experimentally by using pressure-sensitive pins attached to a rectangular plate. (11 refs.)

75967 Plastic flow of shallow shells interacting with rigid dies. G.I.L'vov. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.3, p.44-7 (1983). In Ukrainian.

Deals with a variational statement of contact problems of elastoplastic deformation of shallow shells interacting with rigid dies. The solution existence and uniqueness are proved for flow equations which are regularized. The control of regularization is given in terms of the theory of variational inequalities. (5 refs.)

75968 Variational methods of investigating certain classes of three-dimensional problems of contact between elastic bodies in the presence of friction. A.A.Spektor (All-Union Sci.-Res. Construction-Technol. Inst. of Bearing Industry, Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.548-50 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.592-6 (July 1982). [received: April 1983]

Three-dimensional static problems of contact between an elastic body and an elastic base in the presence of friction, when the coefficient of friction depends on the pressure and the local slippage of the body relative to the base, are discussed. The formation of slippage and cohesion regions at the contact surface is assumed. (13 refs.)

Bull. Jpn. Soc. Precis. Eng. (Japan), vol.16, no.4, p.261-2 (Dec. 1982).

An inexpensive and simple automated method of non-contact type using a laser has been developed. Comparison examination of the observed results on the Brinell hardness value using a conventional measuring microscope method and those of this automated method is reported. (4 refs.)

75970 Simplified vibrating-reed technique for the measurement of the temperature dependence of Young's modulus of small samples. W.A.Aiello, C.R.Wolfe, W.A.Little (Dept. of Phys., Stanford Univ., Stanford, CA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.5, p.594-6 (May 1983).

A simplified vibrating-reed technique for the measurement of the temperature dependence of Young's modulus of small thin samples is described. The vibration of the reed is detected optically rather than with a capacitively coupled electrode as has been used by previous investigators. The optical coupling greatly simplifies the sample stage and electronic circuitry. It is made possible by the use of a microminiature Joule-Thomson-effect refrigerator which mounts directly onto the X-Y stage of a metallurgical microscope. Because of the refrigerator's small size and lack of mechanical vibrations, the high-quality room temperature optics of the microscope can be used to detect the small amplitude vibration of the reed over a wide temperature range. The authors have observed the Curie and Neel points of the magnetic phase transitions of terbium at $T_C = 221K$ and $T_N = 233K$, respectively. In addition, they have measured Young's modulus at 280K to be 5.90×10^{11} dyn/cm². (10 refs.)

46.60 RHEOLOGY OF FLUIDS AND PASTES

75971 The rheology of the fiber-forming process in melts of incompatible polymers at highly uniform shear. M.P.Zabugina, E.P.Plotnikova, G.V.Vinogradov, V.E.Dreval (Inst. of Petrochem. Synthesis, Acad. of Sci., Moscow, USSR).

Int. J. Polym. Mater. (GB), vol.10, no.1, p.1-12 (1983).

The viscoelastic properties of polymer mixtures were investigated over a wide range of component concentrations and viscosities in a field of relatively low shear rates and highly uniform shear stresses. Mixtures of polyethylene and polystyrene were studied. (22 refs.)

75972 Linear and nonlinear viscoelastic functions for polymer melts and concentrated solutions. G.A.Alvarez, H.-J.Cantow (Inst. für Makromolekulare Chem., Univ.-Freiburg, Freiburg, Germany).

Int. J. Polym. Mater. (GB), vol.10, no.1, p.53-76 (1983).

Recent modifications of the Rouse theory for polymer melts and concentrated solutions are presented and compared with measurements of dynamic modulus and oscillatory first normal stress coefficients for cis-1,4-polybutadiene (PB). Measurements of finite-amplitude storage modulus and second normal stress coefficient are given along with current theories to explain these effects. Non-linear transient measurements for PB melts, although in some cases impeded by instrument compliance, provide critical tests for theory. The procedure of extending results of the network theory to nonlinear behaviour, as exemplified by Carreau's model, is shortly reviewed. It is concluded that molecular theories based on clear, independently testable assumptions of molecular architecture, are likely to be better guides for progress in polymer dynamics, than empirical theories. (21 refs.)

75973 Explanation for the 3.4-power law for viscosity of polymeric liquids on the basis of the tube model. M.Doi (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.667-84 (May 1983).

The viscosity $\eta_0(M)$ of polymeric liquids of molecular weight M is calculated on the basis of the tube model formulated by Doi and Edwards (see *J. Chem. Soc. Faraday Trans. II*, vol.74, p.1789, 1978). The contour length fluctuation of polymers along the tube, which was neglected in ref.3, is now explicitly taken into account. The result is $\eta_0(M) = 9.6\eta_0(M_c)(M/M_c)^3[1 - 1.04(M_c/M)^{1/2}]^{1/2}$ ($M \geq 10M_c$) where $M_c = 2M_e$ and M_e is the molecular weight between the entanglement points. This result is numerically close to the empirical 3.4-power law, $\eta_0(M) = \eta_0(M_c)(M/M_c)^{3.4}$, for $10M_c \leq M \leq 100M_c$. It is concluded that the 3.4-power law is actually an approximate expression for the real curve which slowly approaches the asymptotic form. (11 refs.)

75974 Positive hole pressures and negative exit pressures generated by molten polyethylene flowing through a slit die. A.S.Lodge, L.de Vargas (Rheology Res. Center, Univ. of Wisconsin, Madison, WI, USA).

Rheol. Acta (Germany), vol.22, no.2, p.151-70 (March-April 1983).

A new slit die rheometer has been constructed to measure elastic and viscous properties of molten polymers at low shear rates. The wall shear stress σ and the extrapolated exit pressure P_x are determined by means of two pressure transducers mounted flush with a die wall. The hole pressure P^* is obtained from one of the flush-mounted transducers and a third transducer mounted in a transverse slot opposite the flush-mounted transducer. The wall shear rate $\dot{\gamma}$ is obtained from a metering pump. Electrical heaters give melt temperatures that are uniform to within $\pm 0.1^\circ\text{C}$ at 150°C . For two low-density polyethylene samples of Melt Index 2 and 50, at shear rates in the range 0.1 to 8 s^{-1} , it is found that (a) viscosity values agree with those obtained using two Weissenberg Rheogoniometers (WRGs); (b) hole pressure data agree with the predictions of the 'HPB' transverse-slot equation $N_1 = 2\delta dP^*/d\sigma$ when WRG data are used for the first normal stress difference N_1 ; and (c) exit pressures are large and negative, in marked disagreement with certain published equations relating P_x , N_1 and σ . An error analysis shows that P_x values can contain significant negative contributions arising from the pressure dependence of viscosity, even at low shear rates. As a means for in-line measurement of melt elasticity at low shear rates, the results favor the use of the hole pressure, but raise serious questions about the use of the exit pressure. (66 refs.)

75975 Polymer melt rheology with a slit die. H.M.Laun (Kunststofflab., BASF Aktiengesellschaft, Ludwigshafen/Rhein, Germany).

Rheol. Acta (Germany), vol.22, no.2, p.171-85 (March-April 1983).

A piston drive high pressure slit die rheometer with three pressure holes along the die and one in the barrel was used to investigate viscosity, entrance and exit pressure losses, and pressure coefficient of viscosity of a LDPE (low density polyethylene) melt. Hydrostatic calibration of melt pressure transducers can be performed in the rheometer. The slit die results are compared with measurements on circular dies assuming linear and parabolic pressure profiles in both cases. A simplified conversion from apparent to true viscosity, applicable for single point measurements, has been used. In spite of the different symmetries the Bagley correction from the linear pressure profile of circular dies was found to be equal to the sum of exit and entrance pressure losses in the slit. The magnitude and sign of the exit pressure loss depend on the type of pressure profile used. The influence of a pressure dependent viscosity and a temperature gradient along the die on the curvature of the pressure profile is discussed. To directly investigate the effect of pressure the pressure level at constant flow rate was increased stepwise by means of a valve attached to the exit of the slit die. (18 refs.)

75976 Determination of the weight-average molecular weight of polyamide-6 on the basis of melt viscosity. Z.Kembski, J.Torzecki (Inst. of Chem. Engng., Lodz Tech. Univ., Lodz, Poland).

Rheol. Acta (Germany), vol.22, no.2, p.186-96 (March-April 1983).

A theory of a two-point rheometrical method of determination of the weight-average molecular weight M_w of polyamide-6 is presented. The method is based on the measurement of the instantaneous values of zero-shear-rate viscosity of the degrading polymer melt, and a formula is derived which enables the calculation of the initial value of M_w (i.e. at zero-residence-time in molten state) of the investigated sample. The experimental verification of the method proves its applicability. The considerations carried out may be regarded as a first step towards developing a theory of an in-line rheometer for a continuous determination of M_w . (39 refs.)

75977 The rheological behaviour of HDPE/LDPE blends. I. End effects and shear viscosity. D.Curto, F.P.La Mantia, D.Acierno (Istituto di Ingegneria Chimica, Univ. of Palermo, Palermo, Italy).

Rheol. Acta (Germany), vol.22, no.2, p.197-208 (March-April 1983).

The rheological behaviour of three types of HDPE/LDPE (high density polyethylene/low density polyethylene) blends at several compositions (various weight percentages of LDPE) has been studied with the aid of a capillary rheometer and three different capillaries. In particular, entrance effects and shear viscosities have been determined over a wide shear rate region and at different temperatures. Thus activation energies could also be evaluated.

Synergistic effects are evidenced when the relevant properties of the homopolymers parents are not too different from one another. (14 refs.)

75978 Rheograms for engineering thermoplastics from melt flow index. A.V.Shenoy, D.R.Saini, V.M.Nadkarni (Chem. Engng. Div., Nat. Chem. Lab., Pune, India).

Rheol. Acta (Germany), vol.22, no.2, p.209-22 (March-April 1983).

A method proposed earlier has been extended to estimate complete flow curves or rheograms of engineering plastics. Master curves that are independent of the grade and temperature have been generated and presented for acrylics, polyacetal, nylons, polyethylene terephthalate, polycarbonate and polysulfone. The influence of the various molecular parameters on the viscosity behaviour of polymer melts have been explained rationally. More specifically, the effects of chain branching and of chain rigidity on the master curve of a resin type have been elucidated with reference to polyacetal and polysulfone, respectively. The method presented can be used effectively by processors of engineering plastics. (21 refs.)

(see also 03.40G Mathematical aspects)

75979 On mean residence times in flow systems. R.C.Awasthi, K.Vasudeva (Dept. of Chem. Technol., Univ. of Bombay, Bombay, India).

Chem. Eng. Sci. (GB), vol.38, no.2, p.313-19 (1983).

A widely accepted result of residence time theory states that mean residence time is equal to the system volume divided by the flow rate. Taking a two section system it is argued and experimentally demonstrated that the above theoretical result is not universal. A possible implication of this result is that even for a single section system the above result may not hold in all the cases. This is also supported by experimental data on a single section system. 47.15 LAMINAR FLOWS

75980 Analysis of the Couette flow by means of the new direct-simulation method. K.Nambu (Inst. of High Speed Mech., Tohoku Univ., Sendai, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1602-8 (May 1983).

By use of the new direct-simulation method, the exact numerical solution of the Couette-flow problem is obtained over the whole range of the Knudsen number. (The wall Mach number is 3.0.) By comparing the obtained solution, with the approximate six-moment solution, the accuracy of the latter is examined in detail. For the flow velocity and shearing stress, the six-moment solution shows reasonable agreement with the simulation solution. For the temperature, density, and heat flux, the error of the six-moment solution is fairly large in all flow regimes except the near-continuum one. The pressure is not uniform in the transition-flow regime, which is different from the prediction of the six-moment solution.

47.15C Laminar boundary layers

75981 Action of an elastic boundary on a boundary layer. L.P.Kozlov, V.I.Korobov, V.V.Babenko.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.1, p.45-7 (1983). In Ukrainian.

Establishes the fact that the selective character of elastic plates affects the boundary layer. It was found that the magnitude of the effect and the range of Reynolds numbers corresponding to the maximum efficiency are associated with the mechanical parameters of the surfaces. (6 refs.)

75982 A theoretical study of laminar mixed convection from a horizontal cylinder in a cross stream. H.M.Badr (Mech. Engng. Dept., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia). *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.639-53 (May 1983).

The problem of laminar mixed convection from a horizontal isothermal cylinder is considered. The free stream direction is assumed to be horizontal and perpendicular to the cylinder axis. The study is based on the solution of the full Navier-Stokes and energy equations for 2-dim. flow of a Boussinesq fluid. The free stream is assumed to start impulsively from rest and the velocity and thermal boundary layers are developed in time until reaching steady conditions. The investigation covered the ranges of Reynolds number $1 < Re < 40$ and Grashof numbers up to $Gr = 5Re^2$ while keeping Prandtl number at a constant value of 0.7. Comparison of results with previous experimental correlations shows a good agreement. The streamline and isotherm patterns are plotted and different aspects of the phenomenon are discussed. (21 refs.)

75983 Turbulent spots, wave packets, and growth. F.W.Chambers, A.S.W.Thomas (Advanced Res. Organization, Lockheed-Georgia Co., Marietta, GA, USA).

Phys. Fluids (USA), vol.26, no.5, p.1160-2 (May 1983). The smoke wire technique was used to study initial formation and growth of turbulent spots in a laminar boundary layer. The spots were observed to result not from the breakdown of wave packets arising at the spot generator but from longitudinal structures which preceded the wave packets. The original wave packet in turn was observed to ultimately take the form of oblique waves trailing the spot. These waves had little apparent involvement in the growth of the spot and did not appear to be associated with the formation of new spots within the region visualized. (4 refs.)

75984 Approximate determination of the boundary of a lubricating layer. M.A.Galakhov, V.P.Kovalev (Physicotech. Inst., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.535-7 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.560-4 (July 1982). [received: April 1983]

The authors consider the flow of a thin layer of a viscous incompressible liquid between two rigid smooth bodies which are steadily rocking and (or) sliding. They attach a coordinate system to the axes of the bodies in such a way that the region occupied by the liquid is time-independent. They position the x and y axes in the plane tangent to one of the bodies at the point located at the shortest distance from the other body. Let a bounded contact region ω exist in which the liquid occupies the entire interval in z between the surfaces, and let a Reynolds-type equation $\text{div}(h^3 \text{grad } p) = 12 \mu h \dot{h} = 0$, be valid in this region, where $h(x,y)$ is the distance in z between the surfaces, μ is the viscosity of the liquid, $p(x,y)$ is the pressure on it, and $u = u(x,y) = 2^{-1} [u_1(x,y) + u_2(x,y)]$ is the rocking velocity (one-half the sum of the surface velocities). 47.15F Stability of laminar flows

75985 The cancellation of a sound-excited Tollmien-Schlichting wave with plate vibration. C.J.Gedney (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).

Phys. Fluids (USA), vol.26, no.5, p.1158-60 (May 1983). An experiment is conducted in which plate vibration is used to successfully cancel a sound-excited Tollmien-Schlichting wave. With sound excitation, transition to turbulence in the boundary layer occurs at a streamwise Reynolds number (R_x) of 1.2×10^6 . The addition of plate vibration delays the transition to $R_x = 1.8 \times 10^6$. In the laminar region of the boundary layer (at $R_x = 0.97 \times 10^6$) the addition of plate vibration reduces the level of streamwise velocity fluctuations from more than 100 times to only two times the particle velocity of the sound excitation. (8 refs.)

47.25 TURBULENT FLOWS, CONVECTION, AND HEAT TRANSFER

75987 Application of Pade approximation to turbulence problem. A.Fukuyu (Dept. of Math. Sci., Tokyo Denki Univ., Saitama, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1593-601 (May 1983). The energy spectrum function $E(k,t)$ for one-dimensional Burgers' turbulence is defined as a Taylor series expansion in time variable t . Assuming a multivariate Gaussian distribution of velocity field at an initial instant, the first six coefficients of this Taylor series are calculated explicitly in terms of the initial energy spectrum. To approximate to $E(k,t)$ the Pade approximation is adopted. The numerical results show that a Pade approximant is much better than a partial sum of Taylor series as an approximation to $E(k,t)$ for wave numbers which are not large compared with a representative wave number. (9 refs.)

Statistical thermodynamics of turbulent transport processes See Entry 74414

47.25C Isotropic turbulence

75988 Technical improvements for direct numerical simulation of homogeneous three-dimensional turbulence. C.Basdevant (Lab. de Meteorologie Dynamique, Ecole Normale Supérieure, Paris, France).

J. Comput. Phys. (USA), vol.50, no.2, p.209-214 (May 1983). Several equivalent forms of incompressible Navier-Stokes equations in three dimensions are presented. The required number of Fourier transforms and input/output passes are discussed for spectral simulation of periodic flow. (2 refs.)

75989 Turbulent bores and hydraulic jumps. P.A.Madsen, I.A.Svendsen (Inst. of Hydrodynamics & Hydraulic Engng., Tech. Univ. of Denmark, Lyngby, Denmark).

J. Fluid Mech. (GB), vol.129, p.1-25 (April 1983). A theoretical model for the velocity field and the surface profile of bores and hydraulic jumps is developed. The turbulence is assumed to be concentrated in a wedge that originates at the toe of the front and spreads towards the bottom, and the turbulent closure used is a simplified $k-\epsilon$ model allowing for non-equilibrium in the turbulent kinetic energy. The flow equations are satisfied in depth-integrated form (method of weighted residuals), and measured deviations from static pressure are analysed and shown to have a negligible effect on the results. Comparison with measurements shows good agreement, but there is a clear need for further experimental results in the highly turbulent region near the free surface. Some basic mechanisms of the flow are discussed and explained from the theory. (31 refs.)

75990 A statistical model of fluid-element motions and vertical diffusion in a homogeneous stratified turbulent flow. H.J.Pearson (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England), J.S.Puttock, J.C.R.Hunt.

J. Fluid Mech. (GB), vol.129, p.219-49 (April 1983). The vertical displacements $Z(t)$ of fluid elements passing through a source $z=0$ at $t=0$ in a horizontal mean flow with stably stratified statistically stationary turbulence (with buoyancy frequency N and velocity time-scale T), under the action of random pressure gradients and damping by internal wave motions, are investigated by a model Langevin-like equation, and by a general Lagrangian analysis of the displacements, of the density flux and of the energy of fluid elements. Solutions for the mean-square displacement $\overline{Z^2(t)}$, the mean-square velocity $\overline{w^2}$, and the autocorrelation of the velocity are calculated in terms of the spectrum $\Phi(s)$ of the pressure gradient. The authors use model equations for the momentum of fluid elements and for the exchange of density fluctuations between fluid elements, taking the elements' diffusion timescale to be γ^{-1} times the buoyancy timescale N^{-1} , where γ is a measurable parameter. (39 refs.)

75991 Asymptotic near-wall stress dissipation rates in a turbulent flow. B.E.Laund, W.C.Reynolds (Centre d'Etudes, Le Breau, France).

Phys. Fluids (USA), vol.26, no.5, p.1157-8 (May 1983). Provides an analysis for the correct behavior of the dissipation tensor in the Reynolds-stress transport equation in the limit as a wall is approached. This differs from what is used conventionally, and hence is important for turbulence models that include the near-wall region. (2 refs.)

75992 The spatial derivative of temperature in a turbulent flow and Taylor's hypothesis. L.W.B.Browne, R.A.Antonia, S.Rajagopalan (Dept. of Mech. Engng., Univ. of Newcastle, Newcastle, New South Wales, Australia).

Phys. Fluids (USA), vol.26, no.5, p.1222-7 (May 1983). Statistics of the streamwise derivative of temperature fluctuations on the centerline and at one streamwise station in the self-preserving region of a turbulent plane jet have been obtained by two techniques. In one, the derivative is approximated by the difference between the signals from two cold wires separated in the streamwise direction. In the other, the streamwise derivative is inferred from the temporal derivative and different convection velocities. Instantaneous values, root-mean-square values, skewness, and flatness factors are in reasonable agreement for a sufficiently large range of separations regardless of whether the mean velocity (Taylor's hypothesis) or the instantaneous velocity are used as the convection velocity. Corrections for turbulence intensity, that are often applied to Taylor's hypothesis, do not seem warranted. The difference between spectra of the temperature difference and temporal derivative spectra cannot be resolved by identifying the convection velocity with a frequency-dependent phase velocity of the temperature fluctuation. (13 refs.)

75993 A model for the turbulent energy spectrum. R.J.Driscoll, L.A.Kennedy (Dept. of Mech. & Aerospace Engng., State Univ. of New York, Amherst, NY, USA).

Phys. Fluids (USA), vol.26, no.5, p.1228-33 (May 1983). A simple empirical model is developed for the isotropic kinetic energy spectrum. The model can define the spectral distribution as a function of Reynolds number at all wavenumbers. It is compared with spectral data from different types of flows over the $13 \leq Re_\lambda \leq 7000$ range. (18 refs.)

75994 Transport effects associated with turbulence with particular attention to the influence of helicity. H.K.Moffatt (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England). *Rep. Prog. Phys. (GB)*, vol.46, no.5, p.621-64 (May 1983). The action of turbulence on a passive convected scalar field (e.g. temperature) or vector field (e.g. the magnetic field in an electrically conducting fluid) is reviewed, with particular attention paid to anomalous effects that can arise through the influence of Coriolis forces in a rotating system on the statistics of the turbulence. The simplest such effect (which corresponds to a breaking of the Onsager symmetry relations) is a 'skew-diffusion' effect, i.e. the appearance of a component of turbulent heat flux perpendicular to the local mean temperature gradient. The famous α effect of magnetohydrodynamic dynamo theory is also in this category, as is the more subtle Radler effect (the appearance of a mean electromotive force perpendicular to the mean current in a plasma). These effects are all associated with the helicity of a turbulent flow, i.e. the correlation between the velocity field $u(x,t)$ and the vorticity field $\omega(x,t) = \text{curl } u$. (41 refs.)

75995 Homogeneous turbulence. J.N.Gence (Ecole Centrale de Lyon, Univ. Claude Bernard Lyon, Ecully, France). In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.201-22. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1] When studying turbulent flows, it is customary to split all instantaneous random quantities into an averaged and a fluctuating part. Accordingly, the understanding of such flows implies the analysis of the different interactions between the mean and the fluctuating motion. The mean flow field and the statistical moments associated with the fluctuating motion satisfy an infinite set of equations. In order to simplify the equations and to make it easier to understand the physics of the phenomena, different homogeneous turbulent flow models have been proposed. (39 refs.)

47.25F Boundary layer and shear turbulence

75996 On the logarithmic law and Karman's constant. Chou Zuwei (Fu Dan Univ., Shanghai, China). *Acta Mech. Sin. (China)*, no.1, p.27-33 (1983). In Chinese. Starting from the stochastic motion of small spherical vortices, the flow feature of a fully turbulent region of wall turbulence was studied and the differential equation describing this stochastic process was set up. By solving the above equation, the famous logarithmic law was obtained again and Karman's constant was theoretically determined. (11 refs.)

75997 Viscous-inviscid interactions in cascades. C.Hirsch, P.Janssens (Dept. of Fluid Mech., Vrije Univ. Brussel, Brussel, Belgium). *Isr. J. Technol. (Israel)*, vol.20, no.3, p.109-26 (1982). A method has been developed to predict turning and loss coefficients for axial and centrifugal turbomachines in the context of a viscous-inviscid interaction scheme. The procedure computes the blade-to-blade flow field around an arbitrary blade and takes into account the blade boundary layers, eventual separation of these boundary layers and the wake downstream of the trailing edge. The interaction is expressed by the wake displacement body method. The potential flow is solved in a finite-element Galerkin approximation with mixed boundary values. The separation line between the inviscid flow and separated boundary layers and the wake is iteratively searched using a free streamline method. The outlet angle is corrected with a Kutta-Joukowski condition and zero loading is ensured on the wake downstream of the trailing edge. Results are presented and discussed for axial and radial bladings. (29 refs.)

75998 The characteristics of low-speed streaks in the near-wall region of a turbulent boundary layer. C.R.Smith, S.P.Metzler (Dept. of Mech. Engrg. & Mech., Lehigh Univ., Bethlehem, PA, USA). *J. Fluid Mech. (GB)*, vol.129, p.27-54 (April 1983). Employing a high-speed video system and hydrogen bubble-wire flow visualization, the characteristics of the low-speed streaks which occur in the near-wall region of turbulent boundary layers have been examined for a Reynolds-number range of $740 < Re_\tau < 5830$. The results indicate that the statistics of non-dimensional spanwise streak spacing are essentially invariant with Reynolds number, exhibiting consistent values of $\lambda^+ \approx 100$ and remarkably similar probability distributions conforming to lognormal behaviour. Further studies show that streak spacing increases with distance from the wall owing to a merging and intermittency process which occurs for $y^+ \geq 5$. An additional observation is that, although low-speed streaks are not fixed in time and space, they demonstrate a tremendous persistence, often maintaining their integrity and reinforcing themselves for time periods up to an order of magnitude longer than the observed bursting times associated with wall region turbulence production. A mechanism for the formation of low-speed streaks is suggested which may explain both the observed merging behaviour and the streak persistence. (37 refs.)

75999 A novel property of the displacement thickness in three-dimensional boundary-layer theory. T.Cebeci, G.L.Keller, H.Unt (Dept. of Mech. Engrg., California State Univ., Long Beach, CA, USA), K.Stewartson. *Phys. Fluids (USA)*, vol.26, no.5, p.1192-7 (May 1983). It is shown that the equivalent blowing velocity of a three-dimensional boundary layer can be either positive or negative near separation depending on the geometry of the flow. The situation is illustrated by a computation of the boundary layer in the planes of symmetry of a thin ellipsoid moving in the direction of its major axis. This result is of importance in estimating the effect of the boundary layer on the external flow and is distinct from the two-dimensional problem where the blowing velocity always appears to be positive near separation. 76000 Temperature field produced in a flowing gas by a cylinder with modulated temperature. J.Kielbasa (Acad. Polonaise des Sci., Warsaw, Poland). *Bull. Acad. Pol. Sci. Ser. Sci. Tech. (Poland)*, vol.30, no.1-2, p.31-6 (1982). The solution of the temperature field produced in flowing gas by a cylinder whose surface periodically changes temperature is given. It is demonstrated that the relations in this case are similar to those in the case of temperature distribution around a linear heat source periodic in time placed in a gas flow. (4 refs.)

76001 Breakup of a thin liquid layer heated from below. E.Hasegawa (Keio Univ., Yokohama, Japan), J.Kojima. *Bull. JSME (Japan)*, vol.26, no.213, p.380-6 (March 1983). When a thin liquid layer, which is at rest under the action of gravity on a horizontal wall, is locally heated from below, a flow is induced in the layer by the surface-tension force. The flow in such a case is studied theoretically by using the Stokes approximation and the thin film approximation. This flow is governed by two dimensionless parameters, Nusselt number N and thermal Weber number M . When the liquid layer is heated from below, the free surface is always depressed. When the heating is strong, the liquid layer breaks up. The critical value of the thermal Weber number, above which the liquid layer breaks up, is found as a function of N . The shapes of the surface just when a breakup occurs are calculated. The critical thermal Weber numbers are experimentally found for the case of an oil sheet. (8 refs.)

76002 Symmetry analysis of convection patterns. Chen Shi-gang (Inst. of Phys., Acad. Sinica, Beijing, China). *Commun. Theor. Phys. (China)*, vol.1, no.4, p.413-26 (1982). Carries out a symmetry analysis of convection patterns of Newton-Boussinesq fluid in some finite containers. The author also discusses, from the viewpoint of symmetry analysis, the behaviour of infinitely extended fluid layer, as a limit of that in finite container, near convection threshold. (10 refs.)

76003 A class of backward free-convective boundary-layer similarity solutions. H.K.Kuiken (Philips Res. Labs., Eindhoven, Netherlands). *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.655-61 (May 1983). Presents a class of backward free-convective boundary-layer similarity solutions. It is shown that these boundary layers can be produced along slender downward-projecting slabs of prescribed thickness variation, which are infinitely long. It is pointed out that these solutions can be used to describe free-convective flows along vertical fins which have received attention in the literature before. An important result is that the temperature along a downward-projecting fin of constant thickness varies in proportion to the inverse of the seventh power of the shifted longitudinal coordinate. (8 refs.)

76004 The effect of thermal boundary conditions on the heat transport in vertical channels heated from below. H.Frick (Inst. fur Reaktorbauelemente, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany). *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.681-8 (May 1983). A numerical analysis is carried out of the effect of perfectly conducting and adiabatic vertical walls on the heat transport by convection in a fluid heated from below. The equations of motion for a high Prandtl number fluid and the heat equation have been solved by the Galerkin method. Because of the side walls, the convection velocity field has three velocity components and depends on all three spatial coordinates. A two velocity component approximation, as well as the full three component representation of the velocity field, is employed in the numerical analysis. The results indicate the surprising accuracy of the two component approximation. Converged solutions are determined for a range of aspect ratios A between $A=0$ (Benard convection) and $A=20$ (Hele-Shaw convection). (25 refs.)

76005 Enhanced and local heat transfer, pressure drop, and flow visualization for arrays of block-like electronic components. E.M.Sparrow, S.B.Vemuri, D.S.Kadle (Dept. of Mech. Engrg., Univ. of Minnesota, Minneapolis, MN, USA). *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.689-99 (May 1983). Experiments were performed to investigate the heat transfer and fluid flow characteristics of arrays of heat-generating, block-like modules affixed to one wall of a parallel-plate channel and cooled by forced convection airflow. Heat transfer enhancements exceeding a factor of two were achieved by the use of multiple fence-like barriers, with the interbarrier spacing and the barrier height being varied parametrically along with the Reynolds number. The barrier-related pressure drop for a multi-barrier system was found to be less than the corresponding multiple of the pressure drop for a single-barrier system when the interbarrier spacing is small. When the barriers are separated by six or more rows of modules, the direct multiple is applicable. The heat transfer coefficients at individual surfaces of the various modules were measured in fully populated arrays without barriers, in arrays with barriers, and in arrays in which there was a missing module. Perspectives on

the heat transfer and pressure drop results were provided by flow visualizations performed using the oil-lampblack technique. (1 ref.)

76006 Thermal convection in a cavity filled with a porous medium: a classification of limiting behaviours. P.A.Blythe (Center for the Application of Math., Lehigh Univ., Bethlehem, PA, USA), P.G.Simpkins, P.G.Daniels. *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.701-8 (May 1983). Thermally driven flows in a 2-dim. rectangular cavity filled with a fluid-saturated porous medium are considered in the large Rayleigh number limit when the applied temperature gradient is perpendicular to the gravity vector. The standard boundary layer description of these flows is shown to be valid only for $R \gg 10^4 L^2$, where R is the Rayleigh number based on the cavity height and L is the cavity aspect ratio (length/depth). For flows in which $R = O(L^2)$, $L \rightarrow \infty$, the horizontal layers merge and a different solution regime exists. A discussion of the relationship between the merged layer limit (R/L^2 fixed, $L \rightarrow \infty$) and the classical Hadley cell limit (R fixed, $L \rightarrow \infty$) is given. It is found that the intermediate regime R/L fixed, $L \rightarrow \infty$, provides the necessary bridge between the merged layer and the Hadley solutions. Bounds on the extent of the various regimes in the (R, L) parameter space are deduced. The scaling suggested by the merged layer regime gives rise to an alternative correlation of heat transfer data. Existing theories for the Nusselt number are reviewed and shown to be consistent with the new scaling law. (16 refs.)

76007 A correlation for heat transfer by natural convection from horizontal cylinders that accounts for viscous dissipation. R.M.Fand (Dept. of Mech. Engng., Univ. of Hawaii, Honolulu, HI, USA), J.Brucker. *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.709-16 (May 1983). Eight previously published correlation equations plus one new correlation for heat transfer by natural convection from horizontal isothermal cylinders are tested against a fairly extensive body of experimental data culled from the literature for $10^{-8} < Ra < 10^8$ and $0.7 < Pr < 4 \times 10^4$. The new equation, which represents the Nusselt number as a function of the Prandtl and Rayleigh numbers plus an additional dimensionless parameter that accounts for viscous dissipation, is shown to correlate the experimental data more accurately than does any one of the eight previously published equations. It is concluded that viscous dissipation may not be neglected in all cases of natural convection horizontal cylinders, and further, that the inclusion of a viscous dissipation term in certain related problems, such as natural convection in porous media, may lead to more accurate correlation equations. (28 refs.)

76008 On the effects of viscous dissipation and pressure work in free convection loops. H.H.Bau (Dept. of Mech. Engng. & Appl. Mech., Univ. of Pennsylvania, Philadelphia, PA, USA), K.E.Torrance. *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.727-34 (May 1983). The effects of viscous dissipation and pressure work are examined theoretically for laminar free convection loops. The appropriate governing equations are derived. Whereas previous work has considered only dissipation effects, the present paper shows that dissipation and pressure work effects are of comparable magnitude and must be considered together. Analytical solutions are presented for several open and closed loops. Both constant flux and constant temperature heating conditions are examined. Viscous dissipation and pressure work effects are found to have opposing influences on the flow in a loop. The former can enhance a flow for certain heating orientations, but the latter is usually dominant and retards a flow. (14 refs.)

76009 Thermal convection in a porous medium composed of alternating thick and thin layers. R.McKibbin (Dept. of Theoretical & Appl. Mech., Univ. of Auckland, Auckland, New Zealand), P.A.Tyvand. *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.761-80 (May 1983). This paper is a continuation of a recent work by the present authors [J. Fluid Mech. 118, 315-339 (1982)]. The previous paper concentrated on buoyancy-driven convection in a porous medium composed of alternating material layers of equal thicknesses. The present work is a study of the limit case where every alternate layer is very thin and has very small permeability. The onset of convection in such a system and the heat flux at slightly supercritical Rayleigh numbers is studied. As in the earlier work, an investigation of the convergence to homogeneous anisotropy is made. Furthermore, emphasis is placed on applications in insulation techniques and convection in snow layers. (12 refs.)

76010 Free convection about a sphere at small Grashof number. S.N.Singh (Dept. of Mech. Engng., Univ. of Kentucky, Lexington, KY, USA), M.M.Hasan. *Int. J. Heat & Mass Transfer (GB)*, vol.26, no.5, p.781-3 (May 1983).

The authors numerically calculate the flow properties of a free convection problem about an isothermally heated sphere by the series truncation method when the Grashof number is of order unity. In fact, the series truncation method is used to solve the free convection between concentric spheres. A method similar to that used by Dennis and Singh (1978) for the flow between two rotating spheres and Singh and Chen (1980) for free convection problem is used in the present paper. The stream function and the temperature distribution are expanded as series of orthogonal Gegenbauer functions and Legendre polynomials, respectively, in terms of the angle θ of spherical polar coordinates (r, θ, ϕ). The finite set of equations which results from a certain level of truncation is solved numerically for $Pr=0.7$ and Grashof numbers in the range 0.01-1. (10 refs.)

76011 The influence of sound on natural convection from vertical flat plates. H.Matsumura (Dept. of Mech. Engng., Univ. of Akita, Akita, Japan).

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.790-2 (May 1983). The author investigates experimentally the influence of a sound field on the natural convective heat transfer from vertical flat plates by means of flat plates of various width. (6 refs.)

76012 Natural convection heat transfer in a porous layer with internal flow obstructions. A.Bejan (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.815-22 (June 1983). Documents the effect of internal flow obstructions on heat transfer through a 2-dim. porous layer heated from the side. Three types of flow obstructions have been considered. Horizontal diathermal partitions were found to decrease the heat transfer rate in cases where the overall heat transfer was dominated by convection. In the conduction-dominated regime, horizontal diathermal partitions were found to increase the heat transfer rate slightly. Horizontal adiabatic partitions, on the other hand, were found to increase the heat transfer rate when the dominating mechanism is convection. Finally, vertical diathermal partitions were shown to reduce the heat transfer rate by roughly 50% in the convection-dominated regime. Numerical heat transfer results are reported in the domain $0.1 < L/H < 2$ and $50 < Ra_H < 1000$, where L/H is the length/height ratio and Ra_H is the Darcy-modified Rayleigh number based on height. (17 refs.)

76013 Heat transfer in nucleate pool boiling at high heat flux. A.M.Bhat (Dept. of Mech. Engng., Regional Engng. Coll., Srinagar, India), R.Prakash, J.S.Saini.

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.833-40 (June 1983). An analytical model for heat transfer in nucleate pool boiling at high heat flux, near the critical value, is proposed. It is hypothesized that the heat transfer in this region takes place mainly due to the heat conduction through the liquid macrolayer formed on the heating surface. The results of the analysis have been compared with some experimental results and the agreement is found to be reasonably good. (14 refs.)

76014 Pool boiling heat transfer in a confined space. Shi-Chune Yao (Dept. of Mech. Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.841-8 (June 1983). Pool boiling heat transfer in a confined space has been studied for vertical narrow annuli with closed bottoms. Experiments were performed for Freon-113, acetone, and water at 1 atm. for annuli with heights of 25.4 and 76.2 mm, and gap sizes of 0.32, 0.80 and 2.58 mm. Three boiling regimes are identified through visual observation. The importance of the Bond number is also demonstrated. When the Bond number is less than unity, the isolated deformed bubble regime occurs at low heat flux and the coalesced deformed bubble regime is observed at high heat flux. For Bond numbers slightly larger than unity at high heat flux, nucleation on the heated surface has been observed. The general behavior of the boiling curves and the heat transfer mechanisms of these boiling regimes are presented and discussed. (11 refs.)

76015 Duct-flow versus external-flow natural convection at a short, wall-attached horizontal cylinder. E.M.Sparrow, P.Souza Mendes, M.A.Ansari, A.T.Prata (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.881-9 (June 1983). Natural convection heat transfer coefficients were measured at a short horizontal cylinder affixed to an equi-temperature vertical plate for the condition that the plate and the cylinder form one wall of a vertical duct. The duct was open to the ambient at the top and bottom and, aside from the plate and cylinder, its other walls were not directly heated. Substantially higher cylinder heat transfer coefficients could be attained in the duct-flow mode than in the external-flow mode (i.e. where the plate and cylinder face a large open space). Duct-flow-related enhancements of up to 60% were measured. The enhancement is maximized when the duct is as narrow as possible and when the cylinder is positioned near the lower end of the plate. The radiation surface properties of the unheated walls of the duct also affect the degree of enhancement, with black surfaces bringing about greater enhancement by virtue of their higher buoyancy-creating temperature. (8 refs.)

76016 A method of heat exchangers calculation. J.Lach, W.Pieczka (Inst. de Recherches Nucleaires, Service du Genie des Piles, Swierk-Otwock, Poland).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.891-9 (June 1983). A heat transfer analysis of a type of heat exchanger is presented. The conservation laws are limited to the energy balance equations expressed by first order partial differential equations system. Similar problems have been considered in the past but the exact solution has not been presented. The analytical solution of the equation system is given. The heat exchanger equations are the particular case of this equation system. A similar analysis method can be applied in the theory of recuperators and regenerators. Obtaining the general solution for the extension of the heat exchanger problem increases the number of the physical phenomena which can be analyzed with the aid of the method presented. Numerous conservation laws can be described by the differential equations systems discussed, while the method used allows the analysis of various problems described by this type of equation to be simplified. (10 refs.)

76017 An investigation of transient boiling heat transfer with conjugate nature. Shi-Chune Yao (Dept. of Mech. Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA), A.Salehpour.

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.901-9 (June 1983). Temperature controlled transient boiling experiments have been performed to study the effects of mass flux on boiling of F-113 in a vertical annular channel. At higher velocities transient effects have been suppressed. Quenching may start from both ends of the heated tube and quenching starting at the downstream end may result in a lower critical heat flux. Transient convective boiling heat transfer could be of conjugate nature with respect to the solid wall. However, the behavior of a transient conjugate heat transfer problem can be primarily characterized by the parameter: dT_i/dt (the interface temperature rate). This is confirmed by the analysis of a conduction problem, a single phase convection problem, and the data of the present experiments. The transient critical heat flux increases as dT_i/dt increases for heat-up processes but decreases as $|dT_i/dt|$ increases for cool-down processes. (11 refs.)

76018 Analysis of transient natural convection flow at high Prandtl number using a matched asymptotic expansion technique. V.P.Carey (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.911-19 (June 1983). The method of matched asymptotic expansions, which has been used in previous studies of steady natural convection flow, is extended to transient natural convection flows at high Prandtl number (σ). Expansion solutions, valid for large σ , are presented for the transient natural convection flow near a vertical surface which undergoes a step change in temperature. Throughout the transient, the flow is found to have the same dual-layer structure which is characteristic of steady flow at high Prandtl number. For large σ , the time to steady state is shown to increase proportional to $\sigma^{1/2}$. The temperature and velocity overshoot, which occurs during the transient at moderate σ , is shown to disappear as $\sigma \rightarrow \infty$. Uniformly valid expansions for the velocity and temperature profiles near the surface are in good agreement with the calculated solution of the full governing equations for σ as low as 16. For large σ , a simple relation for the propagation of the leading edge effect is also obtained which is consistent with the results of past studies for $\sigma=10$ and $\sigma=100$. (18 refs.)

76019 Theoretical prediction of maximum heat flux in power transients. A.Serizawa (Dept. of Nuclear Engng., Kyoto Univ., Kyoto, Japan).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.921-32 (June 1983). A model has been formulated to predict the burnout characteristics during a power increase. The analytical description of the model is built upon visual and photographic observations of the vapour-liquid configuration near the maximum heat flux reported by other investigators. The broad conclusion is that the maximum heat flux occurs because of a balance between the consumption of a thin liquid layer formed between a vapour blanket and a heated surface and the supply of liquid during the postulated transient. It is also found that the liquid layer thickness is a primary influence on the transient burnout behaviour as well as the liquid supply to the layer. (26 refs.)

76020 The geyser effect in a two-phase thermosyphon. C.Casarosa, E.Latrofa (Istituto di Fisica Generale ed Applicata, Univ. di Pisa, Pisa, Italy), A.Shelginski.

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.933-41 (June 1983).

A phenomenon which was observed during experimental research work carried out on a two-phase thermosyphon with water as the working fluid is described. The phenomenon is a pulsed boiling at low pressure and was called the 'geyser effect'. The heat transfer coefficient at the thermosyphon evaporator has been measured and a functional law, which links this coefficient with the pressure and the specific thermal flux, is proposed; a correlation of the type $Nu = CRe^{0.8}Pr^b$ is also shown to represent satisfactorily the experimental data. (24 refs.)

76021 Combined influence of dissipation and Hall effects on free convective flow in a rotating fluid. H.L.Agrawal, P.C.Ram, V.Singh (Dept. of Appl. Math., Banaras Hindu Univ., Varanasi, India).

Indian J. Pure & Appl. Math., vol.14, no.3, p.314-21 (March 1983).

The present analysis is made to investigate the effects of Hall currents and viscous dissipation on the hydromagnetic free convective flow in the Ekman layer of a conducting liquid past an infinite porous plate. The problem is solved analytically. The velocity and temperature profiles are shown on graphs and the numerical values of τ_w and skin-friction at the plate in x - and y -directions have been tabulated. It is found that primary shear-stress increases and the secondary shear-stress decreases with the increase of magnetic and Hall parameters, whereas the rate of heat transfer from the plate decreases with it. (7 refs.)

76022 Pressure drop during forced convection boiling of binary refrigerant mixtures. L.C.Singal, C.P.Sharma, H.K.Varma (Mech. & Industrial Engng. Dept., Univ. of Roorkee, Roorkee, India).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.309-23 (June 1983).

An experimental investigation was carried out in an electrically heated horizontal tube to measure pressure drop for various flow rates and heat fluxes during forced convection boiling of pure refrigerant 12 and four compositions of refrigerants 13 and 12 mixtures. The Martinelli-Nelson correlation, using the properties of the flowing refrigerant mixture, could not predict satisfactorily the pressure drop data. Total, as well as frictional pressure drops were found to be function of concentration. Two separate models each for total, as well as frictional pressure drop were developed for predicting the corresponding pressure drop. In each case, the maximum per cent deviation between predicted and measured pressure drop was within $\pm 30\%$. (18 refs.)

76023 Laminar natural convection from a horizontal plate and the influence of plate-edge extensions. R.J.Goldstein, K.-S.Lau (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).

J. Fluid Mech. (GB), vol.129, p.55-75 (April 1983).

Laminar natural convection from a horizontal plate is studied by a finite-difference analysis and by experiments for Rayleigh numbers from 10 to 10^4 . The plate with uniform surface temperature or concentration on one side and insulated on the other is situated in an 'infinite' fluid medium. The buoyancy near the surface is directed either outward or inward normal to the active surface—equivalent to a heated plate facing upward or downward. The effect of insulated vertical and horizontal extensions to the plate are also examined. Finite-difference solutions are obtained for a heated strip in a two-dimensional domain for a Prandtl number of 0.7. Mass-transfer experiments are performed with square naphthalene plates in air. Both numerical and experimental results justify a $1/5$ -power law in the present range of Rayleigh number—i.e. Nusselt number or Sherwood number proportional to the Rayleigh number raised to the $1/5$ power. (30 refs.)

76024 Nonlinear convection in a porous layer with finite conducting boundaries. N.Riahi (Dept. of Theoretical & Appl. Mech., Univ. of Illinois, Urbana, IL, USA).

J. Fluid Mech. (GB), vol.129, p.153-71 (April 1983).

The problem of finite-amplitude thermal convection in a porous layer with finite conducting boundaries is investigated. The nonlinear problem of three-dimensional convection is solved by expanding the dependent variables in terms of powers of the amplitude of convection. The preferred mode of convection is determined by a stability analysis in which arbitrary infinitesimal disturbances are superimposed on the steady solutions. Square-flow-pattern convection is found to be preferred in a bounded region Γ in the (γ_b, γ_t) -space, where γ_b and γ_t are the ratios of the thermal conductivities of the lower and upper boundaries to that of the fluid. Two-dimensional rolls are found to be the preferred pattern outside Γ . The qualitative features of the convection problem appear to be essentially symmetric with respect to γ_b and γ_t . The dependence of the heat transported by convection on γ_b and γ_t is computed for the various solutions analysed in the paper. (13 refs.)

76025 Heat transfer and horizontally averaged temperature of convection with large viscosity variations. F.M.Richter (Dept. of Earth Sci., Cambridge Univ., Cambridge, England), H.-C.Nataf, S.F.Daly.

J. Fluid Mech. (GB), vol.129, p.173-92 (April 1983).

Experiments with fluids whose viscosity depends strongly on temperature are used to study the effect of viscosity variations in the range 10^{-10} on the heat transfer and horizontally averaged temperature of a convecting layer between horizontal isothermal boundaries. At large viscosity variations (3×10^3 and 10^5) and Rayleigh numbers less than the critical value given by linear theory, the system can be either conductive or convective depending on whether the Rayleigh number is increased from an earlier conductive state or decreased from a preexisting convective state. At higher Rayleigh numbers and for the entire range of viscosity variation studied the heat transfer differs little ($< 20\%$) from that of a uniform-viscosity fluid when the Rayleigh number is defined in terms of the viscosity corresponding to a temperature equal to the average of the boundary temperatures. The relationship between Nusselt number and supercriticality (R_a/R_c) is even more remarkable being independent of viscosity variation and indistinguishable from that of a uniform-viscosity fluid with appropriate Prandtl number. The horizontally averaged temperature becomes increasingly asymmetrical with increasing viscosity variation due to the relatively large temperature change across the cold, more-viscous boundary layer, and results in an isothermal interior temperature significantly hotter than the average of the boundary temperatures. (17 refs.)

76026 Applicability of boundary-layer theory to calculation of heat transfer under separation conditions. Yu.F.Gortyshev, I.M.Varfolomeev ('A.N. Tupolev' Kazan Inst. of Aviation, Kazan, USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.979-82 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.397-401 (Sept. 1982).

The conditions are examined under which methods and relations developed for attachment flow are applicable to regions of separation flow. (10 refs.)

76027 Convective diffusion toward rotating polar spherical electrode. O.Vain, N.A.Pokryvailo (Inst. of Theoretical Foundations of Chem. Processes, Prague, Czechoslovakia).

J. Eng. Phys. (USA), vol.43, no.3, p.1020-6 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.448-56 (Sept. 1982).

Results are given of a theoretical and experimental study of a concave mass exchange in the regime of limiting diffusion current toward the polar surface of a rotating sphere, for a creeping and boundary-layer type of flow near the surface. (15 refs.)

76028 Solution of the steady-state problem of heat exchange and flow of lubricant in radial sliding bearings with self-aligning segments. V.V.Rukhlinskii, L.A.Gura, O.M.Borisenko (Kharkov Polytech. Inst., Kharkov, Ukrainian SSR).

J. Eng. Phys. (USA), vol.43, no.3, p.1041-7 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.475-83 (Sept. 1982).

Describes a method based on the use of implicit finite-difference schemes, and it presents the results of the numerical solution of the problem of heat exchange and flow of lubricant in multisegment radial sliding bearings. (3 refs.)

76029 Monotonic and oscillatory instabilities of a two-layer system of immiscible liquids heated from below. G.Z.Gershuni, E.M.Zhukhovitskii (A.M. Gorki State Univ., Perm, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.531-3 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.302-5 (July 1982). [received: April 1983]

The authors consider the convective stability of the mechanical equilibrium of a system of two plane horizontal layers of immiscible liquids heated from below. They show that hydrodynamic and thermal interaction of the interface, in contrast with the situation in a homogeneous liquid induces oscillatory modes in the spectrum of the convective perturbations. Under definite conditions the mechanical equilibrium of a layered system heated from below is unstable against oscillatory perturbations. (3 refs.)

76030 Accuracy of analytical computational methods in thermohydrodynamics of two-phase systems. G.M.Arutyunyan, S.T.Ovsepian.

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.631-3 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1367-70 (Aug. 1982). [received: May 1983]

The authors assert that the general analytical methods developed by G.M. Arutyunyan and S.T. Ovsepian [Izv. Akad. Nauk SSSR, Mekh. Zhidk. Gaza, No.5, p.81 (1977)] for calculating thermohydrodynamic processes in two-phase liquid-vapor systems are accurate enough for practical applications. (8 refs.)

76031 Heat transfer in toroidal pipes when the Prandtl number is large. S.I.Chernyschenko.

Vestn. Mosk. Univ. Ser. 1 (USSR), no.2, p.87-90 (March-April 1983). In Russian.

Discusses the temperature distribution in a toroidal pipe in the limit case $Pr \rightarrow \infty$. The temperature is constant along the streamlines of the secondary flow. The temperature distribution on the streamlines is governed by an equation which is derived from the primary equation ($Pr \neq \infty$) by integration along closed streamlines. The boundary condition for this equation follows from the existence of the closed boundary layer near the wall and the symmetry plane of the pipe. (4 refs.)

76032 Non-stationary dissipative structures in a non-linear heat-conducting medium. G.G.Elenin, S.P.Kurdyumov, A.A.Samarskii.

Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.2, p.380-90 (March-April 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*

A study is made of dissipative structures arising in a nonlinear heat-conducting medium from a nonlinear source. In relation to the characteristics of the medium examined, heating occurs either by a propagating thermal wave or by thermal structures localized at fundamental lengths. The emergence of the structures in an initially uniform cold medium leads to a definite space-time ordering. The space-time order in the medium is determined by the eigenfunctions of a non-linear boundary problem. The eigenfunctions are analysed and the stability of the dissipative structures is studied. (55 refs.) A.J.B.

76033 The turbulence measurement in a two-dimensional wake flow of a cylinder. Wei Zhonglei, Niu Zhennan (Dept. of Mech., Peking Univ., Peking, China).

Acta Mech. Sin. (China), no.1, p.70-6 (1983). In Chinese.

Presents some experimental results of the turbulence quantities in a two-dimensional wake of a cylinder and compares these data with Chou's theoretical computational results (1959). (4 refs.)

76034 The structure of a turbulent wake behind a cruciform circular cylinder. I. The mean velocity field. H.Osaka (Faculty of Engng., Yamaguchi Univ., Tokiwadai, Ube, Japan), I.Nakamura, H.Yamada, Y.Kuwata, Y.Kageyama.

Bull. JSME (Japan), vol.26, no.213, p.356-63 (March 1983).

The mean velocity field of a turbulent wake behind a cruciform circular cylinder which is composed of two sufficiently long circular cylinders is examined experimentally. The measurements were performed for the surface pressure distributions on the cruciform circular cylinder and the mean velocity profiles in the wake at a number of downstream stations in a wide range of $x/d=3$ to 594. It is revealed that the decay rate of centerline velocity defect is considerably slower, while the rate of growth of the half-width for the $y=z$ plane of the present wake is very close to that of a two-dimensional wake. In the center region of the wake of the cruciform shape, secondary flows are observed and the magnitude of the flow is measured. (14 refs.)

76035 Turbulent boundary layer associated with periodic rotating wakes. F.A.E.Abd-Elkhalek, Y.Yamamoto, M.Inoue, T.Ikui (Dept. of Mech. Engng., Kyushu Univ., Fukuoka, Japan).

Mem. Fac. Eng. Kyushu Univ. (Japan), vol.42, no.4, p.279-316 (Dec. 1982). [received: May 1983]

The authors attempt to develop a better understanding of the nature of the annulus wall boundary layer that is influenced by periodic disturbances of rotor wakes in an axial flow turbomachine. The mean and phase-locked measurements were made in the turbulent boundary layer on the hub wall behind a rotor with circular cross-section blades. It was found that the periodic disturbances imposed by the rotor wakes cause a considerable deviation of the mean flow properties of the boundary layer from those of undisturbed boundary layer (natural turbulent boundary layer). This phenomenon is caused by interaction of the rotor wakes and the boundary layer which results in a secondary flow associated with re-distribution process of kinematic energy. Introducing the periodic disturbances into the mean boundary layer equation, a term of unsteady force was included in the momentum integral equation. (12 refs.)

Structure and behavior of a turbulent ring vortex See Entry 76049

47.30 ROTATIONAL FLOW AND VORTICITY

76036 One-dimensional mathematical model on peculiar gathering behaviour of particles in a rotating loop. Xu Jianjun (Inst. of Mech., Acad. Sinica, Peking, China).

Acta Mech. Sin. (China), no.1, p.91-4 (1983). In Chinese.

The gathering behaviour of the particles embedded in the fluid of a rotating loop such as the Chandler loop (1958) is discussed theoretically. A simplified model is given and the character of the integral curves of the basic equation is discussed on the phase plane. The result shows that for a certain condition a stable spiral point near the front crescent surface of the loop exists and particle gathering occurs. (14 refs.)

76037 Experimental studies of the flow past a circular cylinder in homogeneous rotating fluid. Liu Yinian, Jia Fu (Inst. of Mech., Chinese Acad. of Sci., Peking, China).

Acta Mech. Sin. (China), no.2, p.119-25 (1983). In Chinese.

The flow past an isolated topography in a rotating system of significance to many geophysical problems. The authors describe experiments on the flow past a circular cylinder in homogeneous rotating fluid. Measurements are given of the block coefficient (which characterizes the flow pattern), the Rossby number, the relative height of the cylinder etc., and their variations along the rotating axis. (8 refs.)

76038 Experiments on a rotating fluid heated from below. D.Tang (Dept. of Chem. Engng., Univ. of Illinois, Urbana-Champaign, IL, USA), J.L.Hudson.

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.943-9 (June 1983).

Heat transfer measurements have been made in a right circular cylinder which is heated from below and rotated steadily about its vertical axis. The range of rotational rates was chosen such that both the gravitational and centrifugal acceleration influenced the convection. Two silicon oils having Prandtl numbers $\sigma=3100$ and $\sigma=7.2$ were used in the experiments. The influence of rotation on heat transfer and on the onset of gravitational instabilities was determined. (18 refs.)

76039 Drag on eccentrically positioned spheres translating and rotating in tubes. H.Tozeren (Dept. of Engng. Sci., Middle East Tech. Univ., Ankara, Turkey).

J. Fluid Mech. (GB), vol.129, p.77-90 (April 1983).

The steady motion of an eccentrically positioned sphere in a circular cylindrical tube filled with viscous fluid is considered as a regular perturbation of the axisymmetric problem. A sequence of boundary-value problems is formulated involving Stokes equations and some linear boundary conditions. Solutions of the first- and second-order problems yield the leading terms in the perturbation series of the additional drag and the torque on the spheres. The results are found to be in good agreement with the previous off-axis solutions. (7 refs.)

76040 Stability and heat transfer of rotating cryogenics. I. Influence of rotation on the onset of convection in liquid ^4He . P.G.J.Lucas, J.M.Potenhauer, R.J.Donnely (Dept. of Phys., Univ. of Oregon, Eugene, OR, USA).

J. Fluid Mech. (GB), vol.129, p.251-64 (April 1983).

Equipment is described for performing measurements of the Rayleigh-Benard instability in a sample of rotating liquid ^4He . Data are presented on the dependence of the critical Rayleigh number for the onset of convection on Prandtl number in the range $0.49 < Pr < 0.76$ and over a range of dimensionless angular velocities $0 < \Omega < 200$. Evidence for the existence of subcritical convection is presented. (30 refs.)

76041 Numerical processing of flow-visualization pictures—measurement of two-dimensional vortex flow. K.Imachi, K.Ohmi (Faculty of Engng. Sci., Osaka Univ., Toyonaka, Japan).

J. Fluid Mech. (GB), vol.129, p.283-311 (April 1983).

A new system has been developed for estimating experimentally some of the principal physical variables of fluid flows, through flow-visualization and image-processing techniques. Distributions of stream function, vorticity and pressure are calculated by this system with reasonable accuracy for two examples of two-dimensional flow: namely unsteady twin-vortex flow behind a circular cylinder accelerated impulsively to constant speed, and Karman vortices behind a circular cylinder moving at constant speed. A detailed explanation of the image-processing technique and the numerical calculation process is given first, and then some consideration is given to calculated results in these two types of flow. Comparison shows that some results of the unsteady twin-vortex experiment coincide well with those of previously published experimental investigations and theoretical calculations. Errors introduced at each stage of this system are estimated in some detail. (11 refs.)

76042 A viscous vortex pair in ground effect. A.J.Peace, N.Riley (School of Maths. & Phys., Univ. of East Anglia, Norwich, England).

J. Fluid Mech. (GB), vol.129, p.409-26 (April 1983).

The authors calculate the flow induced by a vortex pair in a viscous fluid, which is otherwise at rest, in the presence of a plane boundary. This may be either a no-slip or a stress-free boundary. The phenomenon of rebound of the vortices from the boundary occurs for either type of boundary, and an explanation for this is offered in terms of viscous effects. (13 refs.)

76043 Heat transfer of a swirled flow of gas suspension in a short channel. A.I.Mironov, F.I.Sharafutdinov, V.A.Filin, V.K.Shchukin (Tupolev Kazan Aviation Inst., USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.955-60 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.365-70 (Sept. 1982).

On the basis of generalized experimental data obtained by the method of local modeling, the authors suggest a method of calculating the heat transfer of a swirled flow of gas suspension in a short channel. (5 refs.)

76044 Numerical analysis of an axisymmetric viscous flow. Mya Oou, T.Kambe (Kyushu Univ., Fukuoka, Japan).

Mem. Fac. Eng. Kyushu Univ. (Japan), vol.42, no.4, p.371-88 (Dec. 1982). [received: May 1983]

The head-on collision of two coaxial viscous vortex rings is simulated by numerical integration of the Navier-Stokes equation for a viscous incompressible fluid. Numerical results are employed to examine the behaviors of time dependent flow quantities and confirm the importance of viscosity when the cores of the two vortex rings come into contact. Sudden decrease of the total energy and circulation, subsequent to the period of their apparent conservation, is observed to be similar to the energy catastrophe known in the turbulence theory. (6 refs.)

76045 Low Reynolds number flow in a rotating tank with barriers. B.R.Munson, L.D.Sturges (Dept. of Engng. Sci. & Mech., Iowa State Univ., Ames, IA, USA).

Phys. Fluids (USA), vol.26, no.5, p.1173-6 (May 1983).

Experimental and theoretical results are presented for two-dimensional creeping flow in a rotating circular tank that has stationary barriers against its wall. The type of flow pattern obtained depends on the number and size of the barriers. (4 refs.)

76046 Weissenberg effect and its dependence upon the experimental geometry. G.Eitelberg (Inst. fur Experimentelle Stromungsmech., DFVLR, Gottingen, Germany).

Rheol. Acta (Germany), vol.22, no.2, p.131-6 (March-April 1983).

The flow of a second-order fluid with a free surface between two coaxially mounted cylinders of finite length, the inner one of which is rotating, is being studied. In the case of slow flow and small shear rates the flow can be divided into a primary flow in the plane perpendicular to the axis of rotation and a secondary flow in the meridional plane. These flow components are numerically calculated and the results are compared with the analytical results for the semi-infinite cylinder approximation. The influence of the finiteness of the cylinders (end effect) upon the free surface deformation is analysed. The numerical results for the secondary flow are compared with results obtained by flow visualisation. (8 refs.)

76047 Autorotation. H.J.Lugt (David W. Taylor Naval Ship Res. & Dev. Center, Bethesda, MD, USA).

In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.123-47. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]

The subject of autorotation has been a stepchild in fluid dynamics. It is barely mentioned in textbooks and considered more a curiosity than a topic for serious study. Some people have even labeled autorotation as 'toy aerodynamics', a notion that is certainly not justified. The theoretical difficulties are indicated by the fact that autorotation is essentially a nonlinear phenomenon associated with vortex shedding. Analogies exist to vortex-induced vibrations of bodies, a subject area that has attracted more attention in the past than autorotation. All of these problems are addressed in this review. (64 refs.)

76048 Integrable, chaotic, and turbulent vortex motion in two-dimensional flows. H.Aref (Div. of Engng., Brown Univ., Providence, RI, USA).

In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.345-89. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]

The author discusses the restricted subject of two-dimensional vortex motion according to the program indicated by the title. Even with this restriction the spectrum of necessary analytical techniques and possible physical applications is remarkably broad. (204 refs.)

76049 Structure and behavior of a turbulent ring vortex. P.E.M.Schneider.

Report 12/1982, Max-Planck-Inst. Stromungsforschung, Gottingen, Germany (Oct. 1982), i+42 pp.

Of the three flow phases which an unstable ring vortex can take, the turbulent condition is described. A dyed turbulent water ring vortex moving in otherwise stationary water has a warmer shell than its surroundings; a cooler core than its shell; and produces secondary vortices. Parts of these unstable secondary vortices go to form the wake of the turbulent vortex. This production of secondary vortices seems to be responsible for parts of the sound spectra, both of single turbulent vortex, and of jets. The mixing of vortex core and vortex shell material in the secondary vortices is described. The core of the primary vortex controls the frequency of the series of secondary vortices by means of this mixing process. (22 refs.)

47.35 WAVES

- 76050** Analysis of run up height of surface waves in a liquid body excited by the seismological effect. Ni Haoqing (Inst. of Water Conservancy & Hydroelectric Power Res., China). *Acta Mech. Sin. (China)*, no.2, p.144-55 (1983). In Chinese.
From the viewpoint of finite wave height the author derives an analytic solution for the forced oscillation of a liquid body against the surface of a dam excited by seismological effects. A formulae for the run up height of the surface waves is obtained, and can be used in the design of that part of the dam above the highest water level, and to determine its elevation. (11 refs.)
- 76051** On the unsteady motion of a profile in a heavy fluid bounded by a free line. P.Capodanno (Acad. Polonaise des Sci., Warsaw, Poland). *Bull. Acad. Pol. Sci. Ser. Sci. Tech. (Poland)*, vol.30, no.1-2, p.121-34 (1982). In French.
The unsteady motion about a horizontal show translation of an arbitrary profile in an inviscid incompressible heavy fluid in irrotational motion bounded by a free line is studied. In the first part it is proved, using the conformal mapping of the linearized fluid domain into a circular ring, that the ordinate of the free line satisfies a singular integro-differential equation. In the second part, having supposed that the profile is a circle, its harmonic vertical oscillations are studied. An explicit solution for the ordinate of the free line, the complex potential and the aerodynamic forces is obtained. In a more general case it is shown using Fourier's transform, that the problem can be reduced to Fredholm's equation of the third kind. (9 refs.)
- 76052** The contraction of contaminant distributions in reversing flows. R.Smith (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England). *J. Fluid Mech. (GB)*, vol.129, p.137-51 (April 1983).
Exact expressions are derived for the centroid and variance as functions across the flow when there has been an initially uniform contaminant release in an oscillatory flow. Two examples are given to demonstrate that there can be a substantial region of the flow (where the velocity shear is relatively large) in which the contaminant distribution exhibits contraction after flow reversal. This effect, and the sensitivity of the variance to the precise time of discharge, is most marked when the flow oscillations are rapid relative to the timescale for cross-sectional mixing. (14 refs.)
- 76053** Overhanging interfacial gravity waves of large amplitude. D.I.Meiron, P.G.Saffman (Appl. Maths, California Inst. of Technol., Pasadena, CA, USA). *J. Fluid Mech. (GB)*, vol.129, p.213-18 (April 1983).
Methods to investigate the existence of overhanging gravity waves of permanent form at the interface between two uniform fluids of different density are discussed. Numerical results which demonstrate their existence are presented. (4 refs.)
- 76054** Scale effects in a wave-refraction experiment. T.Sprinks (Dept. of Maths., Univ. of Essex, Colchester, England), R.Smith. *J. Fluid Mech. (GB)*, vol.129, p.455-71 (April 1983).
The experimental results of Provis (1975, 1976) for wave amplification at a conical island bear little resemblance to the theoretical predictions of Smith & Sprinks (1975). Here Provis's suggestion is confirmed: that his experiments were dominated by viscous damping and by standing waves between the island and the wavemaker. Estimates are given as to how large an experiment needs to be to avoid these important scale effects. (16 refs.)
- 76055** Effect of water-current interaction on the wave parameter. Li Yucheng (Res. Inst. of Ocean Engng., Dalian Inst. of Technol., Dalian, China). *J. Dalian Inst. Technol. (Dalian Gongxueyuan Xuebao) (China)*, vol.21, no.4, p.81-9 (Dec. 1982). In Chinese. [received: June 1983]
The interaction of a gravity wave with a steady uniform current is discussed. Analysis indicates there is no dominant difference between the results derived from the equation of conservation of wave energy flux and those derived from the equation of conservation of wave action flux. Numerical calculations of wavelength change by different non-linear wave theories show that errors in the results computed by the linear wave theory are less than 10 percent within the range of $0.15 \leq d/L \leq 0.40$, $0.01 \leq H/L \leq 0.07$ and $-0.15 \leq U/C \leq 0.30$, where d is the water depth, H is the wave height in still water, L is the wave length in still water, C is the wave celerity in still water and U is the surface current velocity. Numerical calculations of wave height change employing different wave theories show that errors in the results obtained by the linear wave theory in comparison with the non-linear theories are greater when the opposing relative current and wave steepness become larger. However, within the range of the following currents such errors are not significant. These results were verified by model tests. (7 refs.)
- 76056** Energy flux in capillary-gravity waves. S.J.Hogan (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England). *Phys. Fluids (USA)*, vol.26, no.5, p.1206-9 (May 1983).
The relative energy flux F_{rel} of capillary-gravity waves on a moving stream is calculated for various wavelengths, as a function of wave amplitude. In some cases, abrupt changes in the sign of F_{rel} are found to occur for a small increase in wave amplitude. The way in which the phenomena might be observed experimentally is indicated. (10 refs.)
- 76057** Application of the mixed representation to the study of acoustic-gravity waves. B.Poiree (DRET, Paris-Armees, France). *Rev. Cethedec (France)*, vol.19, no.73, p.29-54 (1982). In French.
It is easier to use a mixed representation (Lagrangian perturbations, Eulerian variables) rather than a pure Eulerian representation in order to deduce the dispersion equation for acoustic-gravity waves in a stratified flow of heterogeneous perfect fluid. The dispersion equation is looked for on the basis of the two representations and advantages of the first representation over the second one are thus placed in evidence: (1) Applying small perturbation equations written down in the mixed representation allows one to get rid of hypotheses usually considered in a fluid at rest (homogeneity and isothermal atmosphere). Hines' equation is thus generalized. (2) The use of the Eulerian representation brings up two important points. The first of these concerns the writing of the perturbed state equation in this representation. The second one concerns ambiguities which appear in the search for a solution in the form of an inhomogeneous harmonic plane wave in a system of partial differential equations with variable coefficients whenever no orders of magnitude are accounted for. To end with, the energy equation is given in both representations. (34 refs.)

- 76058** Drag of a vaporizing spherical particle in a slow flow of a binary mixture of gases. A.Yu.Boris. *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.507-8 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.553-5 (July 1982). [received: April 1983]
Taking into account the Barnett concentration stresses the author proposes to solve the problem of the influence of vaporization (condensation) on the force acting on a sphere in a slow flow of a binary mixture of gases. He shows that the concentration stresses can exert a significant influence on the drag of the sphere. He discusses the quasi-steady vaporization of a spherical particle situated in a mixture of its own vapor with a gaseous component that is insoluble in the sphere. (6 refs.)
- 76059** Calculation of gas flow in a zone of energy release in a cylindrically-symmetrical explosion. V.G.Grudnitskii, V.N.Rygalin. *Zh. Vychisl. Mat. & Mat. Fiz. (USSR)*, vol.23, no.2, p.413-22 (March-April 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
The problem of a cylindrically-symmetrical explosion in a quiescent gas was investigated numerically. Energy is liberated in the medium in accordance with the equation of state of a polytropic gas. The instantaneous and continuous liberation of energy in the course of a certain time was investigated, together with the different types of distribution of the emitted energy along the radius. On the basis of the theory of dimensionality, laws of similarity are derived, characterizing the rate of development of the gasdynamic processes in the region of action of the source. (12 refs.) A.J.B.
- 76060** On the theory of the horizontal-axis wind turbine. O.De Vries (Nat. Aerospace Lab., NLR, Amsterdam, Netherlands).
In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.77-96. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]
The extraction of energy from the wind is an old idea, one used by sailing ships and windmills for many centuries. The development of ancient windmills was based on empiricism and engineering skill. The development of the fluid mechanics, or more specifically the aerodynamics, of windmills (wind turbines in modern usage) is more recent. The study of the aerodynamics of wind turbines was begun after World War I by Betz (1926) and Glauert (1935) and got a new impulse after the 'energy crisis' of 1973-74. Nowadays, it is a worldwide field of research, stimulated and guided by national research programs in the US, Sweden, Denmark, The Netherlands, Great Britain, and many other countries. (39 refs.)
- 76061** Low-Reynolds-number airfoils. P.B.S.Lissaman (AeroVironment Inc., Pasadena, CA, USA).
In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.223-39. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]
The airfoil section is the quintessence of a wing or lifting surface and, as such, occupies a central position in any design discipline relating to fluid mechanics, from animal flight through marine propellers to aircraft. The proper functioning of the airfoil is the prerequisite to the satisfactory performance of the lifting surface itself, and thus the airfoil is of fundamental technical importance. The author describes the fluid mechanics, performance, and design of low-Reynolds-number airfoils, which he takes to include the range between Reynolds numbers of about 10^4 and 10^6 . (9 refs.)

- 76062** Effect of sound absorbing wall linings on aerodynamic forces of a subsonic vibrating cascade. N.Yamasaki, M.Namba (Dept. of Aeronautical Engng., Kyushu Univ., Fukuoka, Japan). *Mem. Fac. Eng. Kyushu Univ. (Japan)*, vol.42, no.4, p.251-78 (Dec. 1982). [received: May 1983]
A method of singularity is developed to predict the effect of sound absorbing wall liners on the unsteady aerodynamic forces for a linear cascade vibrating in a subsonic uniform flow between parallel walls. A side wall of the model is partially composed of a sound absorbing liner with uniform acoustic admittance. The lined section of the wall is confined to the portion swept by blades. Substantial variation of the total aerodynamic work with change in the wall admittance is found to occur only in a confined range of the admittance magnitude. The functional form of the aerodynamic work as a function of the admittance magnitude is heavily dependent on the admittance phase. (12 refs.)

47.40H Transonic flows

- 76063** A mixed direct-inverse problem of the transonic plane cascade. Shen Mengyu, Ma Yuanle (Qinghua Univ., China). *Acta Mech. Sin. (China)*, no.1, p.1-6 (1983). In Chinese.
A mixed direct-inverse problem of the transonic plane cascade is presented, and a general solution procedure is given. By using a computer code based upon the described mixed direct-inverse scheme, the flow field through a given plane cascade can be analyzed, the transonic plane cascade can be designed with desirable aerodynamic performance and reasonable strength characteristics, and a desirable local correction of the transonic plane cascade profile can also be made. The formulation of this mixed direct-inverse problem and its solution procedure have been tested by application to the example of Hobson's impulse cascade (1977). The result is satisfactory. (8 refs.)

47.40K Supersonic and hypersonic flows

76064 Application of the triple-deck theory of viscous-inviscid interaction to bodies of revolution. Ming-ke Huang, G.R.Inger (Dept. of Aerospace Engng. Sci., Univ. of Colorado, Boulder, CO, USA). *J. Fluid Mech. (GB)*, vol.129, p.427-41 (April 1983).
The general triple-deck theory of laminar viscous-inviscid interaction is extended to axisymmetric bodies. With body radius/length ratios scaled in terms of Reynolds number as $Re^{-1/8}$ ($\beta > 0$), it is found that for $\beta < 3$ the only three-dimensional effect is that on the incoming undisturbed boundary-layer profile as accounted for by the Mangler transformation. When $\beta = 3$, however, an explicit axisymmetric effect on the interaction equations also enters: the upper-deck flow is governed by the equation of axisymmetric potential disturbance flow, whereas the middle and lower decks are still governed by equations of two-dimensional form. When $\beta > 3$, the body is so slender that transverse curvature effects become important and the lower decks too are explicitly influenced by three-dimensional effects. A detailed example application of this theory is given for weak interactions on a flared cylinder and cone in supersonic flow with $\beta \leq 3$. The three-dimensional effects on the interactive pressure and shear-stress distributions are shown to relieve the strength of the interaction and reduce its upstream influence, as expected. (24 refs.)

47.40N Shock-wave interactions

76065 Non-equilibrium flow of a vibrationally relaxing gas behind three-dimensional unsteady curved shock wave. V.D.Sharma, R.Shyam (Acad. Polonaise des Sci., Warsaw, Poland). *Bull. Acad. Pol. Sci. Ser. Sci. Tech. (Poland)*, vol.30, no.1-2, p.1-9 (1982).
A shock wave is assumed to exist in a three-dimensional unsteady flow of a vibrationally relaxing gas. The variation of flow parameters at any point on the streak lines behind the shock surface is determined in terms of the shock geometry and the upstream flow conditions. The expressions for the vorticity and the curvature of a streak line at the rear of the shock surface are also determined in terms of the known quantities. (7 refs.)

76066 Stability loss of detonation waves in lengthened charges of heterogeneous explosives. V.A.Danilenko, V.M.Kudinov. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.3, p.41-4 (1983). In Ukrainian.
It is shown that stationary detonation waves of heterogeneous explosives lose their stability at distances from the initiation place exceeding those specified by stationary and stable conditions. The stability loss results in formation of detonation waves with a pulsating front. Two stationary conditions with different detonation rates in the explosive length were found for the detonation of explosives of a solid oxidizer-liquid fuel type. (4 refs.)

76067 Two-point implicit scheme for the Euler equations. S.Obayashi (Inst. of Engng. Mech., Tsukuba Univ., Ibaraki, Japan), K.Kuwahara. *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1525-30 (May 1983).
A new two-point implicit scheme for solving the Euler equations was developed, which is second-order accurate in space and time. This is an extension of the MacCormack implicit scheme, and takes account of the following points: 1. solving for the physical quantity itself at a new time-step, not for change of the physical quantity in time, 2. modifying the implicit operators for stability so as not to decrease accuracy of the approximation of the first derivative. The resulting method is efficient and easy to program. This scheme was compared with various other schemes for a shock tube problem. No physically irrelevant pressure distributions of the shock wave obtained by the present method were observed. It was confirmed that the present one produced good results for a large CFL number.

76068 On the propagation of weak and moderately strong, curved shock waves. F.Obermeier (Max-Planck-Inst. für Stromungsforschung, Göttingen, Germany). *J. Fluid Mech. (GB)*, vol.129, p.123-36 (April 1983).
The author studies the theoretical description of curved converging shock waves, where nonlinear interaction effects, between the shock fronts and the flow behind them, and refraction effects are equally important. In a non-viscous, isenergetic and isentropic flow the problem can be described by a nonlinear wave equation for the pressure field. This equation then admits an analytical solution with the help of the method of strained coordinates provided that the nonlinear terms contain only derivatives with respect to two independent variables. This restrictive condition is approximately fulfilled if the incoming wave is only slightly curved. (18 refs.)

76069 Analysis of self-similar problems of imploding shock waves by the method of characteristics. Y.Nakamura (Faculty of Engng., Kumamoto Univ., Kumamoto, Japan). *Phys. Fluids (USA)*, vol.26, no.5, p.1234-9 (May 1983).
